SO FAR as nature is concerned the cattlemen of California are having the best year of a decade for their stock. A warm wet California winter, with spring in the air already in many portions of the state, grass abundant or coming, and a market so short that they are shipping in beef from Denver and Kansas for the supply of Los Angeles city, which is alone killing 28,000 cattle monthly.

The season is made. The cattlemen are now confident as to range and no other part of the Southwest has had the rain or weather to make possible competition. This state has after years of drouth returned to normal and fulfilled the expectations of man. Southern Arizona, which last year had such a wonderful year that they put forth grass beef in competition with California, is dry. The great Phoenix desert has had light rains, but feed is backward, and the California sheepmen will again have the crop that killers must have. There is no state that gives greater hardships in drouth than California, with the possible exception of parts of Texas and Kansas, and no state that gives richer feed and makes the early beef from grass when we do have a good year.

The northern part of California was a garden spot before Christmas and the coast soon thereafter. Middle California has had wonderful rains, and the district southeast of Bakersfield is the best it has been for 20 years. Bakersfield proper and to the west and north was slower but it is coming fine now, and the mild winter that makes possible the thinning of beets at such an early date on the Coast is the same weather which makes grass abundant and luxurious.

No feed known can fatten like the California alfilaria and burr clover. Actual tests have shown a six pound daily gain in a large steer. Cattle that look as if they weighed 800 pounds in January have been known to go over the scales 1,200 pounds by May, a gain that no feeding of meal or even corn can approximate.

Buyers claim that cows have stiffened $5 per head, at least on the California ranges, in the last 30 days. You hear of men now in the market for young steers. Money is easing up; the note of optimism is sounded in newspapers and banking circles. Some cowmen prophesy the highest priced grass cattle California has ever known for July and make the statement in the face of Denver cows at $7.50 delivered Los Angeles and Kansas City steers at $10.

The new figures of the department of agriculture show a depreciation in national cattle numbers of over 2,000,000 head. The statistics of steers on feed and on range show great number decline.

Some of the larger California men have been selling steers up to $10.50 and cows up to $8.50, but the ordinary man could well figure a cent under that as his price. No wonder these large men oppose stockyards. California has had the highest comparative cattle market in the country although at that cattlemen have been heavy losers for the last year.

From reports obtainable it would seem that this market will be able to secure no Phoenix cattle and few from Nevada or Utah for beef slaughter during the next four months. Imperial is said to have 3,000 or 4,000 head and there are about 6,000 being fed locally around Los Angeles.

The Coast and middle California will have grass beef soon, and the grass run will be this year ahead of schedule. The only competition that California has will be Eastern price for beef animals plus railroad freights and shrink. The same expense that proved a dire hardship when California was shipping to the Middle West market last year is now proving to be in favor of price here, when the only obtainable beef must stand identical expense.

The cattlemen have little organization that is truly cooperative and cannot be relied upon to protect their price to insure a profit, and this lack of organization is the only thing that would prevent them from securing a fair price for their grass beef this year. Whether they have progressed in the hardships they have had to meet and will unite and make their association a power instead of a form remains to be proven by this year's actions. If enough of them rush to a low contract price for their grass cattle they will be as usual the sport of killers and will shear from $10 to $20 per head from the prospective price they have the right and the isolation of supply to demand.

From the best sources I can hear, cows from grass may go 7 to 8 cents and steers 9 to 10. Packer cow beef of good quality is quoted to 17½ cents by the carcass. Some junk cow beef is being peddled at 12 to 14 cents. There has been little, if any, drop retail in the cities, although some country killers are having difficulty in selling loins and hind quarters of the eight cent cows they are killing, and some of the country shops have made material reduction in beef owing to their custom dropping considerably in its monthly meat bill. This situation is unusual, and if prophetic, may show what will happen soon to retail trade in the cities and would surely force down the profiteering margins now exacted in many city shops. Very good loin steaks can be bought in country shops within 20 miles of Los Angeles for 35 cents per pound, and first class rib roasts as low as 30 cents. I have seen excellent hams I can vouch for as to taste and quality being offered at 38 cents, and bacon as good at 40, in these suburban shops.

The junk beef can be readily told by consumers owing to its lean blue look, and much of it comes from old dairy cows or Mexican stags and steers. The firm red beef with white fat is plentiful in the market right now, and if consumers would pass the cheap tough blue meat and demand the right sort this 12 and 14 cent carcass competition wouldn't last long.

This is the first change with a definite backing that is now taking place in the cattle business for many months. A good grass year, easier money and easier prospects to be soon felt by the trade generally, stimulated demand owing to shortage, and the long delayed surrender of the profiteering retailers, all make for encouragement. Nothing is sure, but the outlook is better than for a year in the California cattle trade, and you hear talk now as if men had hope.

Market Barley Through Hogs---Good Hogs

By Harvey M. Berglund

WITH the barley market at its present low mark, most Sacramento Valley communities are facing a rather serious condition. In my community around Dixon there is at present around $200,000 worth of unsold barley in the warehouses, figuring it at $30 a ton. It could have been sold at harvest time at an average of around $60 a ton, or a total of $400,000. There has therefore been a net loss of $200,000, together with interest at eight per cent for six months, or $32,000. This makes a total loss to the farmers of one community of nearly a quarter of a million dollars.

What is to be the future of the barley market? Optimists talk of a recurrence of high markets, but the facts as they stand at present do not warrant so rosy a future for three reasons.

In the first place Great Britain, the chief importer of the world's barley crop, is buying on a cheaper market elsewhere, Argentine and South Africa being their chief sources of supply. Both of those countries have an abundance of cheap labor. Argentine's new barley crop will be harvested in March and April and export-

ers in that country are now offering this new crop at a price around $4 a ton less than the lowest price we can quote.

In the second place, prohibition has practically cut off the demand for brewing barley in this country, and even though such were not the case it would help little, for most of the California crop is not of brewing grade. The Middle West has the largest corn crop on record and growers are being offered around $20 a ton for their crop by the elevator companies. So there is no outlet in that direction. As a matter of fact, Eastern corn is now being shipped out here for feeding and milling purposes. It has a higher feed value than barley.

In the third place, less than a third of the barley is now used for local consumption by stock than was the case ten years ago, due to the extensive use of tractors, motor trucks and autos.

The foregoing statements are not theoretical, but are the facts as they stand today and should give the farmer who is holding his barley for high price food for thought.

Great Britain will not pay the high prices that grain growers would like because she does not have to; the Middle West is overstocked with corn; and brewers cannot use the barley even though they want to. Those conditions leave only one outlet that offers a solution to the problem, and that is greater home consumption.

Home consumption necessarily means feeding more livestock of all kinds. The grain farmer can accomplish this either by feeding more stock himself or by cooperating with those who are feeding livestock so they can handle more stock and thereby use more feed. This latter plan would probably entail a system of credits, which could be arranged through local bankers.

In my community we are not only producing too little livestock but the quality is not as high as it should be, due to a lack of care, and even more to the lack of grain that should be fed liberally. The livestock we send to market as a finished product is far inferior to the average eastern animal. This is true, I believe, in cattle and sheep as well as hogs. However, I refer mostly to the hog situation as I am better posted on that score.

A year ago the situation of the pork producer was very grave, with a low market and all grains sky high. It put a great many out of business during the past spring and summer from the actual loss they incurred, or because they could make easier money selling their grain. Ninety per cent of the first class were men who flocked into the business with the idea of making easy fortune. The grain growers saw no reason to bother themselves feeding grain to livestock with grain selling at the unheard of prices then prevailing. The result has been that there are now over six million

PROGRAM OF STOCKMEN'S WEEK, UNIVERSITY FARM, DAVIS
FEBRUARY 22 TO 25

Tuesday, February 22

Senator B. F. Rush, presiding. 9:30—Greetings, H. E. Van Norman, dean of the University Farm School; Stockmen's Week, R. F. Miller, acting head animal husbandry division; What the Future Holds for the Pure Bred Beef Cattle Industry, W. A. Cochel, American Shorthorn Breeders; Preservation of the National Forests, C. E. Rachford, forest service.

Afternoon—California Shorthorn Breeders Consignment Sale.

Wednesday, February 23

T. H. Ramsey, president California Cattlemen, presiding. 9:00—Meeting California Cattlemen, District 2; Annual Pacific Coast Hereford Cattle Breeders; Annual California Aberdeen-Angus Breeders; Stabilization of the Forest Grazing Permits, Paul G. Redington, district forester; Range Management, T. N. Lorenzen, forest service; Progressive Policies of the Beef Cattle Industry, R. J. Kinzer, secretary American Hereford Cattle Breeders.

Afternoon—Pacific Coast Hereford Cattle Breeders Consignment Sale.

Farmers and Stockmen's Mass Meeting

H. E. Van Norman, dean University Farm School, presiding. 7:15—Motion picture film, "A Year in Jersey History," Dr. H. G. Gross, American Jersey Cattle Club; Relation of the College of Agriculture to the Livestock Industry, Professor Walter Mulford, acting dean; Development of the Farm Bureau, Dr. H. W. Walker, president California Farm Bureau Federation and vice-president National; the Work of the Agricultural Legislative Committee, R. N. Wilson, secretary agricultural legislative committee.

Thursday, February 24

J. M. Henderson, Jr., presiding. 9:00—The Development of Official Testing in California, Paul I. Dougherty; What the Future Holds for the Dairyman, J. E. Dorman, chief federal dairy bureau; Meeting the Competition of Dairy Products Substitutes, S. H. Greene, California Dairy Council; Better Sires Campaign, C. W. Rubel, assistant state leader; Greater Dairy Production, E. H. Webster, former chief U. S. dairy division and dean and director Kansas experment station.

1:00 p. m.—Calfornia State Dairy Cow Competition, F. W. Woll; Feeding the Dairy Herd, W. E. Tomson, animal husbandry division; Problems of the Dairymen in the Coast Region, L. W. Wing Jr., Elkhorn Ayrshire Farm; Developing a High Producing Herd, Frank L. Morris; Proposed Pacific Slope Dairy Show, S. H. Greene; Meeting California Jersey Breeders Association; meeting California Holstein Breeders Association; meeting California Guernsey Breeders Assocaton.

1:00—Sale of pure bred Berkshire hogs, Western Berkshire Congress.
7:00—Banquet and meeting Western Berkshire Congress.

Friday, February 25

J. I. Thompson, presiding. 9:00—Annual meeting California Swine Breeders Association; Commercial Marketing of Hogs, Roy M. Filcher; Closer Cooperation Among Swine Breeders in California, C. B. Cunningham; Relation of the California Experiment Station to the Swine Industry, Dr. C. M. Haring; Commercializing the Pure Bred Hog Business, Park Bennett; Contagious Abortion in Swine, Dr. F. M. Hayes; Hog Feeding, E. H. Hughes, animal husbandry division.

12:00—Meeting California Poland China Breeders; meeting California Duroc-Jersey Breeders; meeting California Hampshire Swine Breeders.

Afternoon—California Poland China Breeders Consignment Sale.

Railroad Gives Reduced Rates

Reduced rates on railroads providing 150 with tickets costing $1 or more, attend and ask for and register at the meetings their receipts. All attendants should ask receipt at purchasing point. Buy tickets to Davis, not to Sacramento.

Hotels

Accommodations at Davis are limited, so reservations should be made at Sacramento hotels. Train and stage service regular.

Cut the Costs—Swell the Profits

The stock-grower who keeps his cost of production low enough is safe on any market. Selling on a high market he gets *big* profits—on a low market he gets *some* profits instead of facing a loss.

And whether you produce dairy products, beef, pork, mutton or wool you can surely reduce costs by regularly adding to the ration the tested, dependable stock tonic—

Pratts Animal Regulator

It helps build and preserve stock health:—that means work animals in the harness every day, steady milk production from every cow, rapid growth of young stock. It aids digestion:—that means a saving of food, all used, none wasted. It strengthens and tones up the whole system:—that means strength, vigor and vitality without which any animal is of little value.

Cut costs, too, by checking contagious diseases which may kill some of your stock and seriously injure the rest. Use, regularly and freely,

Pratts Dip and Disinfectant

to kill disease germs and parasites. As a dip to exterminate lice and ticks and overcome skin troubles. As a disinfectant to maintain stables and pens in sanitary condition. Low in cost—safe—powerful—efficient.

Make this your motto—"Every animal on the job every day." Then make good by using Pratts Stock Preparations. You must be pleased—

"Your Money Back If YOU Are Not Satisfied"

GEORGE W. BELL

A BUSINESS AUCTIONEER

When in need of high class auctioneering service I would be glad to have breeders and farmers correspond with me. I have had years of experience, know values and know pedigrees. I am selling for many of the leading breeders of California and am prepared to deliver the same results that have attracted this custom. Terms reasonable. Write, wire or phone.

GEO. W. BELL Tulare, California

With the Tide, or Against It?

Sir Aaggie De Kol Acme

His sire, ARALIA DE KOL PONTIAC SEGIS, is a son of Aralia De Kol, the first cow to make over 28,000 lbs. milk in one year, and she also made 1142 lbs. butter in one year. We believe she is the only 1100 lb. cow to have two daughters and a granddaughter each above 1100 lbs. and a 2 year old granddaughter above 930 lbs. He has a number of daughters with substantial records in heifer form.

His dam, AAGGIE ACME OF RIVERSIDE 2ND, holds the world's strictly official record of 1331.47 lbs. butter in one year. She is out of the great foundation cow Aaggie Acme of Riverside, 1054 lbs. butter in one year. She is the dam of Miss Aaggie Acme Burke, 1024 lbs. butter in one year as a first calf junior 2 year old from over 24,000 lbs. milk, the latter a world's record in class when made, and she in turn is the dam of the $41,000.00 bull King Korndyke Pontiac Acme. This heifer at her last freshening as a junior 4 year old made 35.38 lbs. butter from 726.2 lbs. milk in 7 days.

SIR AAGGIE DE KOL ACME is being given the largest opportunity of any sire we have developed to date, as he is being bred to a very large number of females, and the performance of his first daughters confirms our belief in his ability to transmit the outstanding production of his near ancestors.

He is owned jointly by ourselves and

Fred W. Kiesel
Jane Garden Farm
Sacramento Cal.

Why waste time and energy pulling against the tide, when its power would carry you on if you choose its direction?

The tide in California's Holstein breeding runs strong to the blood of the great families developed in this herd, a tide that is gaining force and power steadily as the enormous capacity for milk and butter production is constantly being demonstrated by descendants of these families in the hands of many different breeders.

Are you going with the tide of breeding represented by Aaggie Acme of Riverside, Miss Valley Mead De Kol Walker, Aralia De Kol, Aaggie Acme of Riverside 2nd, De Kol of Valley Mead, and Tilly Alcartra?

If not, you are missing a wonderful opportunity to benefit through the work of many of the best breeders of California who are successfully developing herds based on this breeding.

A bull bred in these lines will start your herd in the right direction. Let us hear from you NOW We may have the right bull to head your herd, and if not our knowledge of and experience with these families may be of benefit to you.

MANAGEMENT
California Breeders Sales and Pedigree Company
C. L. Hughes, Sales Manager, Sacramento, Cal.

less hogs in this country than last year. Feeds have dropped close to 60 per cent, while hogs have dropped less than 30 per cent. The shortage of hogs is already being felt in most parts of the country. The demand for pork products in this country is far better than it was a year ago, for many persons are now using pork who could not afford to before. Foreign trade is slightly better. I have heard a number of men predict a high pork market for the coming summer and fall because of these things, but if I were to make a guess it would be this: that grain and pork have struck their relative levels; that is, if grain goes up so will pork in proportion, and vice versa. The increased consumption and the actual shortage that exists cannot help but make for a steady market.

How much will your barley bring you if you market it through hogs?

If one had a lot of prime hogs to put on the market now it would bring around $50 a ton, a nice profit over the present grain market; and if fed properly hogs could be turned off at seven months instead of from 14 to 18 months as is occasionally done now.

If you have scrub sows and feel that you cannot afford to buy pure breds at present, get hold of a good pure bred boar to mate them with.

Some hog raisers have had excellent results crossing two breeds, using pure bred boars of one breed and sows of another. However, some others have had very poor results from this practice. This brings to mind the experience of a dairyman who crossed a Holstein and a Jersey. He wanted an animal that would give the great flow of milk of the Holstein and the high test of the Jersey. He got the milk production of the Jersey and the test of the Holstein from the offspring. Cross-breeding is a gamble at the best. The safest and best road in the long run is to use pure breds of one breed. Your pig crop will be more uniform.

Which breed to select is sometimes a question. If you have a very strong liking for one particular breed over all others, adopt that breed and stay with it. If you are in doubt as to which to select, look up the records of the various leading breeds and adopt the one that is being most universally selected by the pork producers of this country—then you surely cannot go wrong.

With the wonderful production of barley and our alfalfa for pasture, no other state can raise hogs cheaper or better.

Raise more and better hogs, and if you feel the need of speculating go down to San Francisco and play the call board; you won't have to wait six months or a year to find out how much you are going to lose, or if this is too strenuous, indulge occasionally in that "great American indoor sport," called poker, to satisfy that craving for speculating that seems to be in the blood of so many of the grain farmers.

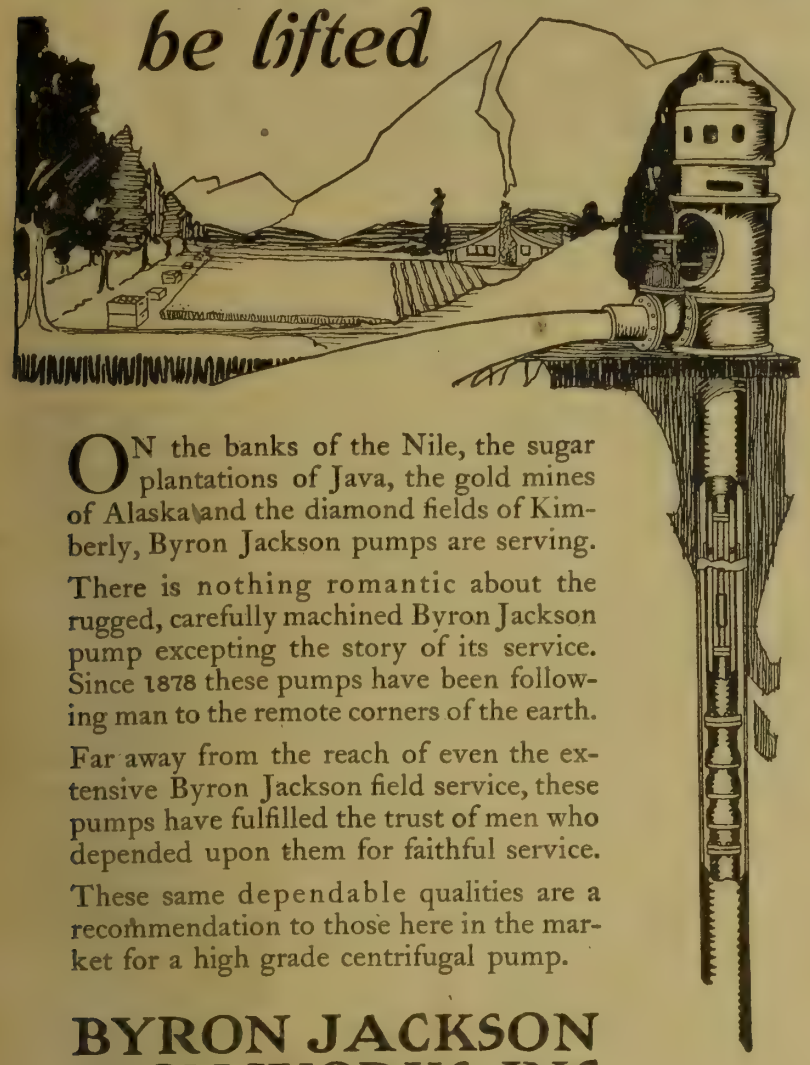
THE BERGLUND AND HARROLD DUROC SALE

The second annual sale of bred Duroc sows and gilts held by Harvey Berglund and Boyd Harrold of Dixon, February 5, drew a good sized crowd of neighboring farmers. This was a good indication of the interest being taken in better stock by the pork producers. Twenty-five head were sold at a $50 average, which was regarded as satisfactory to both buyers and seller. The top price was $120 for a two year old sow purchased by Stanley Rogers, Davis.

The Wyndham Dairy of Redding has recently purchased six head of high class Ayrshires from leading Canadian herds and plans adding several more. Included in the purchase is a young cow that as a two year old produced 453 pounds of butter fat from 10,765 pounds of milk, which is said to have been the best two year old record in Canada at the time it was made.

Dr. J. A. Roberts of Hollywood reports winning two silver cups, 23 first prizes, 9 seconds, 4 thirds, 4 fourths and 2 fifths, and 42 ribbons out of 54 entries, on cavies exhibited at the Southern California Rabbit and Pet Stock Association show at Los Angeles, February 3-7.

Wherever water is to be lifted



ON the banks of the Nile, the sugar plantations of Java, the gold mines of Alaska and the diamond fields of Kimberly, Byron Jackson pumps are serving.

There is nothing romantic about the rugged, carefully machined Byron Jackson pump excepting the story of its service. Since 1878 these pumps have been following man to the remote corners of the earth.

Far away from the reach of even the extensive Byron Jackson field service, these pumps have fulfilled the trust of men who depended upon them for faithful service.

These same dependable qualities are a recommendation to those here in the market for a high grade centrifugal pump.

Cowpeas for Pasturage

IT is not considered the best farm practice to use cowpeas strictly as pasture, but under certain conditions it is advisable and profitable, say specialists of the United States department of agriculture, in Farmers Bulletin 1153, "Cowpeas: Utilization," just published by the department. Cowpeas furnish a pasture crop during a period of the year when such forage can be used to the best advantage. The small amount of work and the small cash outlay always associated with the grazing of stock commends the practice to the average farmer, and scarcity of labor often makes it necessary to pasture a crop whenever possible. Another advantage in pasturing cowpeas is that not only is the soil benefited, but the waste vines and animal droppings are also left on the land. The soil, after cowpeas have been pastured, is in an excellent condition of productivity for the fall sowing of wheat.

Best at Maturity

The best time for turning the stock on cowpeas is when the crop has reached the stage of maturity considered best for hay; that is, when the first pods have matured. This practice, however, is not generally followed, as it is usual to gather at least a part of the seed. When cowpeas are grown in corn the grazing is deferred until the corn has been gathered. Cattle usually are turned on earlier than hogs or sheep, the hogs being pastured on the ripe seed. If the stock are turned on before the plants have attained full size, there is more waste from trampling. As with most green pasture crops, there is danger of bloat when sheep or cattle are first turned on cowpeas, especially in wet weather. The danger from bloat, however, is far less than with alfalfa, and decreases as the cowpeas become more mature. If the seeds are sufficiently mature, frost will not greatly lessen the pasture value of the vines.

Practical experience shows that good results are obtained by pasturing cowpeas with any kind of livestock. The most common practice is to hog them down. For young hogs cowpeas are a good feed, but some grain is required in connection with the cowpeas for best results. Hogs usually will feed on the mature pods first and leave the vines and leaves, especially when dry. After hogs have been pastured on a field for some time, cattle or sheep may be used profitably to pasture off the leaves and vines which the hogs leave. Sheep may be used on cowpeas in the same way as hogs. When sown in corn, the stover blades and cowpea seed make a fine ration for fattening fall lambs and wethers. Dairy cows show the effect of such pasturage in a much increased flow of milk.

At the Arkansas agricultural experiment station steers fattened on cowpea pasture and cottonseed meal made an average gain of two pounds a day for 90 days. As long as the cowpea vines were green and considerable seed was available, very little cottonseed meal was eaten. The cost per pound of gain was only two cents for the cottonseed meal, thus showing the high value of the cowpea pasturage. The Oklahoma agricultural experiment station reports that cowpeas planted in July furnished two grazing periods for milk cows before frost, and that the flow of milk was noticeably increased.

Benefits Hogs and Cows

In a feeding trial at the Alabama agricultural experiment station it was found that pigs fed on corn alone gained 0.36 pound daily, while hogs on cowpea pasture and corn gained 0.97 pound daily, consuming 36 per cent less corn for each pound gained. The same station conducted a feeding experiment with pasturage for dairy cows, using an upland cornfield from which the ears had been removed and in which cowpeas had been drilled between the rows. The field was first pastured by three milk cows and later by three dry cows. The milk cows in the meantime received three pounds of cottonseed meal daily. On this pasturage the yield of milk was 15.8 per cent greater and the yield of butter 9.5 per cent higher than when the cows with the same grain feed ran on a good pasture of Bermuda grass, carpet grass and lespedeza. In addition to the increase in milk and butter the cows gained a total of 85 pounds during the 19 days, and the dry cows 53 pounds in nine days.

SHORTHORN SALE

The business of breeding high class Shorthorn cattle, though perhaps still a young industry in California, will demonstrate at Davis on February 22 that it is a strong and lusty infant. Importations from the East and direct from Britain have given this state's herds the best blood strains of the world as well as some outstanding individuals, and the Californians who own and handle these herds are second to none in their ability to advance the breed. The results of the last few years of importations and breeding will be seen in the first sale of Shorthorns to be conducted by the California Shorthorn Breeders Association at the university farm, in Stockmen's Week.

The consigners are: W. M. Carruthers, C. N. Hawkins, Geo. G. Pierce, W. T. Chapple, Henry M. Elberg, Thos. T. Miller, Ormondale Ranch, Mrs. Eliza Shepard, T. Wilson Dibblee, Thornton S. Glide, Edw. Cebrian, Howard Vaughn, L. N. Pabst, Geo. E. Dierrsen, C. Harold Hopkins, A. L. Klopping, R. T. McGurk, University Farm, Robt. F. Miller, Senator B. F. Rush, Easton & Ward, Wm. Bond.

MORE THAN 10 000 ADVANCED REGISTER GUERNSEY RECORDS

On December 15, 1920, the number of Advanced Register records completed by Guernsey cows exceeded the 10,000 mark. A total of 10,033 records had been completed by 8,469 cows. Six cows had completed five records each; 26 had completed four records; 196 had completed three records; and 564 had completed two records. The average production of all records completed by Guernseys of all ages was 9,068.27 pounds of milk and 454.06 pounds of butter fat, with an average test of 5.005 per cent. Of the total number of records, 37.6 per cent were completed by cows two years of age.

The system of yearly testing for the Advanced Register, which has been adopted in only slightly modified form by all dairy breed associations, was first established by The American Guernsey Cattle Club in May, 1901, almost a score of years ago. The first cow to complete an Advanced Register record was Glenwood Girl 6th 9113, whose record was 12,187.33 pounds of milk and 572.30 pounds of butter fat.

CARE OF SOWS AND SPRING PIGS

A record of the date of service of each sow should be kept, so that the date of farrowing will be known in advance. The period of gestation in sows is usually placed at 112 days. Often young sows will farrow a few days sooner than the stated time and old sows will frequently go a few days over it. Ten or 12 days before farrowing, the sow should be separated from other hogs and placed into a farrowing pen, so as to become accustomed to her surroundings and changed conditions before the pigs are born. The farrowing pen should be dry, well ventilated, and free from drafts. It is a good plan to provide the pen with a guard rail at the sides of the pen a little above the bed to prevent the sow from lying against the partition, and lessen the danger of injury to the little pigs, which often find space under the guard a very convenient refuge. A moderate amount of cut straw or some good bedding should be placed in the farrowing pen shortly before time for farrowing. Sows should be treated kindly and kept quiet at farrowing time.

After farrowing the sow should not be disturbed. If she lies quietly for ten or 12 hours, or even more, it is to her advantage. If she wants anything she will make it known by coming to the trough or searching for it. One should not be hasty in trying to feed her. At first she should have a

very light feed. A thin slop of middlings is very satisfactory. Constipation should be avoided if possible. It is well to bear this in mind some time before farrowing. If the sow becomes constipated before farrowing she may lose her pigs, and possibly her own life. When it once occurs very little can be done to overcome it, so it is well to use preventive measures. No sudden changes in the ration should be made. If a sow is taken directly from the pasture, shut up in her pen, and fed an exclusive meal ration, trouble is almost sure to occur. The ration should be kept practically the same after taking the sow into the pen as it was before. If anything the feed should be made rather more sloppy. Some meal should be fed to sows while on pasture for a time before they are brought to farrowing pens. A small amount of linseed meal is helpful in preventing constipation. Wheat bran in small amounts serves well for this purpose. During the first three days after farrowing, much care should be exercised to avoid over feeding. After this, the feed may be increased gradually, taking a week or more to reach full feed.

When the little pigs are about three weeks old it is a good plan to give them access to another pen where they may be fed away from the sow. A little skim milk with middlings stirred into it is very satisfactory for pigs of this age. The quantity of middlings can be increased gradually as the pigs grow older. Scattering soaked corn or some other grain on the floor of the pen or in the lot will cause them to take exercise which is very necessary. Exercise is very important for both the young pigs and the sow and provision should be made for it. If they do not exercise willingly they should be forced to do so.

These suggestions are based on results at the Georgia experiment station, at other experiment stations, and by swine breeders.

FEEDING VALUE OF COTTONSEED

One hundred pounds whole cottonseed has a productive value of 17.09 pounds and contains 13 pounds digestible protein on an average. One hundred pounds cold pressed cottonseed contains 12 pounds productive value and has a content of 19.7 pounds digestible protein, says G. S. Fraps of the Texas experiment station. The cold pressed cottonseed, therefore, contains 50 per cent more digestible protein, but has only about two-thirds the productive value of cottonseed.

The whole pressed cottonseed would have a greater feeding value than the whole cottonseed as long as the ration fed was deficient in protein, but as soon as the ration supplies enough protein for the needs of the animal, the excess of whole pressed cottonseed would have only two-thirds the value of the cottonseed. On the other hand it is not advisable to feed more than four or five pounds per day of cottonseed to fattening cattle as the larger quantities are liable to injure their digestion, cause digestive disturbances, and give poor results.

The relative values of cottonseed and cold pressed cottonseed for feeding cattle would depend upon the object of the feeding and the kind of other feeds available. Cottonseed may be compared with corn or milo better than with cold pressed cake. It is nearly equal to milo in feeding value and has about 15 per cent less feeding value than corn.

A VALUABLE EXPERIMENT

In Glasgow they tell of a resourceful clergyman who is never at a loss for a retort. He was once called to the bedside of a very wealthy but stingy man.

"If," he gasped to the clergyman, "if I leave several thousands to the church, will my salvation be assured?"

Whereupon the divine responded:

"I wouldn't like to be too positive, but it's well worth trying."—Tit-Bits.

A WORD PAINTER

"Did I understand you to say that artist was also a literary man?"

"No; I said he was a great word painter. He never produces any pictures really worth mentioning—he merely talks about them."—Boston Transcript.

JOHN LEWIS CHILDS, Inc. Floral Park, N.Y

HINTS ON GARDENING

Morris & Snow Seed Company, 420 South Main Street, Los Angeles, is issuing its catalog for 1921. More correctly, the title is "A Few Hints on Gardening." The best hint of all is perhaps the calendar of planting operations to which some two or three pages are given. There are also sowing tables, seed required to an acre, and a number of other valuable hints. In addition a freely illustrated list of ornamentals, vegetables and plants of all kinds is given.

GRAPEWILD FARM BERKSHIRE SALE

The sale of bred Berkshire sows and gilts held by A. B. Humphery's Grapewild Farm, Escalon, Thursday, February 3, was very successful. Considering the quality of the offering and the prestige of the Grapewild herd both as show winners and breeding stock, the range of prices really should have been higher. However, under the existing circumsances the prices obtained were very satisfactory. The local support by neighboring farmers was not as good as the offering deserved. This seems to be the existing condition at most of the sales and seems unexplainable as the present price of grain and pork will yield the greatest profit that has been possible in years. Over half of the sows and gilts in this sale sold at a figure where any pork producer could have made money by using them to grade up his pork herd.

The top of the sale was lot No. 1, Leader's Escalon Princess 4th, purchased by H. C. Muddux & Son, Sacremento, for $350.

Alex Wilson of the Italian Vineyard Company, Guasti; J. Francis O'Connor, Santa Rosa; Fred Makinsen, Modesto; Montezuma Ranch, Collinsville, and Calla Gove Farm, Manteca, were all strong buyers and bidders.

With L. E. Frost of Chicago in the ring and Col. John A. Davis, Manteca, on the block, the sale was conducted in a high class manner. The average price was $99 per head.

Following is a list of sales:

1, H. C. Muddox & Son, Sacramento, $350.
2, Italian Vineyard Co., Guasti, $155.
3, H. C. Duddox & Son, $60.
5, H. C. Muddox & Son, $115.
6, Calla Grove Farm, Manteca, $150.
7, D. J. Bastanchury, La Habra, $150.
9, J. Francis O'Connor, Santa Rosa, $80.
10, Montezuma Ranch, Collinsville, $70.
11, Butte City Ranch, Butte City, $100.
12, H. C. Muddox & Son, $105.
13, Fred Makinson, Modesto, $95.
14, J. Francis O'Connor, $75.
15, J. R. Dinsmore, Las Vegas, Nev., $130.
16, J. Francis O'Connor, $125.
17, Montezuma Ranch, $80.
18-19, J. Francis O'Connor, $60-$60.
20, Montezuma Ranch, $60.
21, Kamehameha School, Hawaii, $100.
22, Calla Grove Farm, $85.
23, T. W. Powell, Lodi, 85.
24, J. Francis O'Connor, $75.
25, Fred Makinson, $80.
26, Montezuma Ranch, $60.
29, Italian Vineyard Co., $160.
30, Calla Grove Farm, $65.
31, Italian Vineyard Co., $50.
32, Fred Makinson, $50.

THE CALIFORNIA DUROC BREEDERS SALE

The second annual consignment sale of the California Duroc Breeders Association, held at the university farm, Davis, Saturday, February 5, was a decided success. The offering was presented in good condition, and while some of the individuals should have been of higher class, the offering as a whole was good. The average on the entire offering sold was $95 per head.

The way the offering sold and the number of new buyers interested in the sale were taken as a good indication of future business. A large crowd was present, including many of the students at the state farm, several of whom were buyers. The students gave added strength to the sale by their consistent bidding.

The top of the sale was lot 27, a splendid fall yearling sired by Pathfinder, consigned by Winsor Ranch, Bonita. After a spirited bidding contest between the state farm and Dr. Sorensen of the Western Laboratory Co., Stockton, she was knocked down to the latter at $500. The next top was an entry from the Diamond Bar Ranch, Spadra. This good young sow was sold for $300 to G. W. Atterbury, Woodland, who was one of the heaviest buyers and bidders present. The Western Laboratory Company of Stockton, F. C. Lundy, Napa, and W. W. Chandler, Vacaville, were also good buyers. Col. Geo. W. Bell, Tulare, sold the offering in a high class manner. Following is a list of sales:

2, G. W. Atterbury, Woodland, $55.
5, W. W. Chandler, Vacaville, $70.
6, G. W. Atterbury, $65.
7, R. E. Clifford, Davis, $120.
8, G. W. Atterbury, $150.
9, W. W. Chandler, $95.
10, Harvey Berglund, Dixon, $55.
11, Harvey Berglund, $60.
12, Western Laboratory Co., Stockton, $55.
13, Western Laboratory Co., $60.
15, F. C. Lundy, Napa, $85.
17, E. Varney, Davis, $60.
19, O. V. Humason, Davis, $80.
27, Western Laboratory Co., $500.
31, G. W. Atterbury, $300.

Veterinary

Pigs With Cough

We have some young pigs that cough quite a bit, especially early in the morning when they get up. One died the other day and we cut it open and found that the lungs were all right but the liver was yellow or about half yellow. They have coughed ever since they were born. They have been running on alfalfa and green grass. For last three or four months have fed milk and raw potato off and on. Please tell us what is wrong with them.—Subscriber, Paicines.

It is very difficult from what you say to diagnose the trouble with your pigs. The symptoms of coughing would indicate some inflammation of either the lungs or windpipe. If upon a post-mortem examination it is impossible to find the trouble, it would be wise to consult a competent veterinarian who could, no doubt, upon personal examination, diagnose the trouble and suggest a satisfactory remedy.

THE ECONOMICS OF BETTER LIVESTOCK

(Continued from Page 195.)

further comment. All that has been said in regard to improving dairy and beef herds holds true with equal force for swine and sheep.

The writer could go into greater detail, but the point should have been made clear that pure bred livestock is capable of improving the common stocks of livestock and that such improvement makes for greater profit, and that in short is the one big argument for urging wider use of better blood. The man who refuses to adopt better methods when once the practicability of such methods has been pointed out deserves no more consideration than he is getting. The world is moving too fast for the public to pay serious attention to the lamentations of the man engaged in any line of production until he first of all manifests a desire to help himself. Until we as individuals put into practice every factor calculated to increase the efficiency of our business we cannot expect our organizations to be in position to place our needs before the public.

If we refuse to join cow testing associations so that we can find out which cows are making a profit, and until we use methods to increase our production, until we use a better class of bulls on our ranges and a better class of sires throughout our breeding operations, until we lay aside our prejudice and are willing to adopt progressive methods, until we learn the truth that we will be compensated in proportion to the effort we expend, until we learn that the use of better livestock is nothing more than an economic proposition—that it is not by any matter of means an impractical or "fancy" notion, we will be paying the piper without much chance of enjoying the dance.

COST OF PRODUCING MILK

What does it cost to produce milk? This is the question that has brought increasing concern to each dairyman. In answer to it the United States department of agriculture through the dairy division conducted a series of studies to give dairymen reliable information. These studies were begun in 1915, but the most recent upon which any data have been published was begun in 1917, in Skagit County, Washington, about 70 miles north of Seattle. The report of this study is contained in Department Bulletin 919, "Unit Requirements for Producing Milk in Western Washington."

A study of the results given in the bulletin shows that at the time of the study 56.4 per cent of the total cost of producing milk at the dairies investigated was for feed and bedding; 23.5 per cent for labor; 17.6 per cent for other costs; and 2.5 per cent for depreciation. The requirements for producing 100 pounds of milk during the winter were: Concentrates, 29.4 pounds; dry roughage, 92.9 pounds; succulent roughage, 143.3 pounds; bedding, 9 pounds; human labor, 1.9 hours; horse labor, .01 of an hour; other costs, $0.576. During the summer milk could be produced at much less cost, there being required a comparatively small amount of concentrates.

During the two years covered by the study, 44.5 per cent of each year's income from milk was obtained during the winter. During the first year records were obtained on 17 herds having an average size of 31.3 cows, with an average annual production of 7,369 pounds of 3.74 per cent milk per cow. During the second year 18 herds, 15 of which had been in the first year's work, had an average size of 28.6 cows and produced an average of 8,323 pounds of 3.59 per cent milk per cow. From each 100 cows in the herds during the two years, 55 freshened during the winter six months period and 42 during the summer season, while three cows did not calve during the year. Nearly one-half of the cows freshening dropped their calves during the months from February to May, inclusive.

Most of the milk in this section is sold for condensing purposes and is delivered by motor truck to large milk condenseries. All the herds selected for study were representative of dairy conditions found in that section. It is the custom to hire milkers who milk and take care of 25 to 30 cows per man and give their entire time to the herd.

In western Washington the pasture plays a very important part in milk production. With cool weather throughout most of the summer, plenty of moisture and a rich soil, there is abundant pasture until late in the fall. During the pasture season almost 60 per cent of the milk for the year was produced and at one-third of the yearly feed, bedding and pasture cost. The annual pasture charge per cow amounted to 1.1 acres, or $23.04. Such items as veterinary fees, medicine, disinfectants and other items amounted to $1.45 per cow per year. It was found that the number of hours required to care for a cow did not differ materially between the summer and winter seasons. However, due to the increased flow of milk in summer, the time required to produce 100 pounds of milk in that season was materially less in summer than in winter.

AN APPRECIATION OF THE GOAT

I enjoyed Mrs. Koethen's article in the Cultivator on "Lorraine — the Goat." It was interesting to me, as I have had a similar experience.

For several years I have had tuberculosis of the lungs. With outdoor life and light work and plenty of rest I am able to do my own cooking and care for a few chickens and rabbits. Last summer with the warm weather I lost considerable weight and didn't feel so well, so the family thought I ought to have a goat and in August bought Mamie, paying $25 for her. She had her third kidding in June and when I got her was giving two quarts of milk a day. Since then she has dropped to one quart a day. By November I had gained ten pounds and feel better all the time. My feed bill is about $2.50 a month, or eight cents a day. Of course, I don't feed as well as Mrs. Koethen does. Mamie eats a mash of bran and barley while I'm milking her. During the day I stake her on the hills, which abound in tecalote and which she devours greedily. After I milk her at night she gets alfalfa or oat hay. She is the most affectionate thing but surely has a will of her own. — Clarence W. Churchill, Fallbrook.

MILKICISMS

In these days of adulteration, first thing we know they'll be running milk trains without a cowcatcher.—North Adam (Mass.) Herald.

Some poor city children visited a farm. Each was given a glass of milk. "Well, boys, how do you like it?" "Fine! I wish our milkman had a cow."—Dallas Morning News.

For sale: Cow that gives quarts of milk a day, also two grindstones and one set of harness.—Winnipeg Free Press.

WITH EVERYTHING ELSE

At Sadieville, Kentucky, a tourist called to an old colored man: "Hey, Uncle! How far is it to Lexington?"

"I do' know, suh; hit used to be 'bout 25 miles, but ev'rything's gone up so I speck hit's 'bout fohty now, suh."—Youth's Companion.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Burglary Loss

Some boys broke into my house and did a great deal of damage. They were arrested and fined, but I have not yet been paid for the loss. How shall I proceed to collect?—Subscriber, Escondido.

It is probable that your only remedy is an action against the different boys for the damage caused, as the mere fact of parentage alone does not render a parent liable for the wrongs done by his minor child if unauthorized and unratified by the parent.

Right of Way Only

I bought a piece of land, through which the grantor reserved the right of way for road purposes only. This right of way is bordered on each side by trees and the orchard. Can the grantor pick the fruit or otherwise damage or remove the trees if he has ample room within which to drive over the established road?—Subscriber, Paradise.

The grantor has no right or interest in the property other than the mere right to travel over it. If he picks the fruit or injures trees he is liable as a trespasser.

No City Benefits

Some 51 families live in the city, pay all city taxes but they receive no benefits. What steps can be taken to compel water and fire protection?—Subscriber, Escondido.

The best method is to take the matter up with the city council and if the present city council does not take action, see that a council is elected which will, or you might take such proceedings to exclude you from the city.

Water Polluted.

I have a domestic water pipe running over a neighbor's land with his consent. At one point there has been an open stand placed through which the water runs. Six feet from the running water the neighbor has carelessly made an installation which will contaminate the water. Can I require its removal if the neighbor objects? What is the procedure?—Subscriber, Claremont.

If the water is polluted it is unquestionably a nuisance and you could have action by way of injunction to require the neighbor to remove the cause. It is even probable that the maintenance of such an installation which would pollute the water would render the neighbor liable for punishment for misdemeanor.

Minor Married

A girl marries a man who stated in the license that he was 21 years of age. It now appears that he is only eighteen. She was 22. Can the girl's parents take action to annul the marriage in case she should not wish to do so? What could be done?—Subscriber, Saugus.

It has been held that it is only in cases where the party seeking to annul the marriage is under the age of consent to a marriage, that is, respectively, 18 and 15 years, that the action may be taken to annul the marriage, and in that case only by the party who is under the age of consent. It is true that the law provides that the county clerk shall issue no marriage license if the male is under the age of 21 years or the female under the age of 18 years, except with the written consent of the parents of the person under age, but in the case stated it was held that even when the county clerk, willfully or through mistake, issued such license to the person under the age last stated without the consent of the parent, and such marriage was afterwards solemnized, it is neither void or avoidable by reason of the failure of the clerk to perform his duty. Certainly, in the case stated, the only person who could take any action whatever to annul the marriage would be the party under age. The young man in making his application for marriage license, being obliged to swear to his true age, unquestionably committed perjury, but that would not affect the validity of the marriage and would merely render him personally liable, if convicted, to punishment.

Net Weight of Grain

Has there been a state law passed recently deducting the weight of sacks when selling grain or corn?—Subscriber, Imperial.

Under amendment to Net Container Act of 1913 it is provided that the quantity of contents shall be the net amount of food or stuff or other commodity in the package or container. The term container is defined as "any receptacle or carton into which any commodity is wrapped or put for sale." The provision under the original act was that the quantity of contents required to be marked on the outside or on the label or tag attached to the container should be the amount of food or stuff in a package, the change being the word "net" before the word "amount."

BARLEYS FOR CALIFORNIA

Mariout barley is best for light or sandy soils; for dry localities; when fall planted, but will stand spring planting better than other varieties; should not be fall planted on heavy, cold, wet soils in Northern California.

Tennessee Winter barley is best for fall planting on heavy, moist, cold soils in Northern California; for the cooler mountainous districts in Northern California; must be planted prior to January 1 to get the best results; not adapted to sandy soils or to the warm, dry grain districts of Southern California.

Four Thousand barley is a pure line selection of common barley which is ten per cent more productive than ordinary common barley under all conditions; it should replace common barley under all average conditions in which the special drouth resistance of Mariout, or the special cold and wet soil resistance of Tennessee Winter, are not required; it is a more prolific variety than Beldi, and is now recommended for all situations where Beldi was formerly grown.

Because the above named varieties have been found superior, Beldi barley is no longer being recommended or distributed by the state experiment station.—G. W. Hendry, University Farm, Davis.

TOO MUCH ALFALFA?

The department of agriculture is concerned over the large planting of alfalfa. The slump in cotton is turning cotton growers to other crops, at least to a limited extent. Especially is this found true in irrigated lands of all the Southwest. The cotton growers are now disappointed at market conditions, and their present tendency is to turn their cotton land back to alfalfa, because alfalfa during the last season has been scarce and prices high. Department specialists believe there is danger that this irrigated land will be planted to alfalfa to such an extent that by the end of next season the supply of alfalfa hay will be in excess of the local feed requirements. It would seem the part of wisdom to continue to devote a fair proportion of the irrigated land to cotton, using the most efficient and economical methods of production, in the expectation that market conditions next year will give a fair return for the crop.

In any event an excessive alfalfa acreage should be avoided because the livestock population of these irrigated valleys is now below normal and the alfalfa crop is too bulky to be moved long distances to market. In general, the action most urgently needed in the valleys of the Southwest is the increase of livestock, so as to permit a return to a sound basis of diversified farming.

HYATT

ROLLER BEARINGS

HYATT BEARINGS make farm tractors better because they carry the severest loads under all conditions without wear on the rolling parts and never require adjustment. They reduce the need for oiling to once or twice a season.

You can obtain almost any kind of farm operating equipment—be it tractor, truck, motor car, plow or threshing machine—Hyatt-equipped.

For Your Own Orchard and Garden

we suggest for immediate planting—

the usual Citrus and Tropical Fruits:
the feijoa, avocados, mangos, kumquats, limes.

the sturdy Deciduous Fruits:
apples, peaches, pears, plums, nectarines, strawberries, raspberries, nuts and all the bush fruits.

Where space is limited, we suggest the Citrus Combination Tree which bears five kinds of fruit—tangerine, lime, lemon, and two kinds of oranges. You can pick ripened fruit from this tree every month of the year.

Write for our beautifully illustrated 1921 Catalog describing these and hundreds of other varieties of Fruits, and a full line of the Ornamentals—shrubs, climbing vines, roses, hedges, palms and shade trees.

Kafir: Eastern, No. 2, 1.57½.
Corn: Bulk, No. 3 Yellow, 1.45@1.50.
Bran: Kansas, 34.25.
Barley: 1.41¼.

HAY

Alfalfa Growers of California report under date of February 9:

Receipts of alfalfa hay during the week showed some increase and were readily absorbed by the current demand at a slight concession from previous prices. Offerings from Nevada continue at prices somewhat below the market for California hay, though these prices, on account of the high freight rates to here, do not net the Nevada growers more than about $10 a ton at shipping point for their best quality. Since the cost of baling and hauling easily absorbs half of this there would not seem to be much left for the grower. The market for wheat, barley, corn, etc., touched new low levels during the week, bringing prices still farther below cost of production and threatening the growers with losses on the coming crop, in addition to those on the old.

There were 850 tons received on the tracks in Los Angeles the week ending February 5, with 90 tons held over as against 600 tons the week before.

Rabbit alfalfa 38.00
No. 1 dairy alfalfa 26.00
Standard alfalfa 23.00

TREE SPRAYS

The trees in your orchard are your stock in trade, your merchandise in warehouse. You cannot afford to take chances. They should be protected.

B T S

is a dry Barium Sulphur insecticide and fungicide. It is effective in killing scale insects, red spiders, etc. It is the spray material to use during the dormant season.

B T S is economical. Leakage is eliminated — 80% of the weight is eliminated. It is safe to use and easy to dissolve.

B T S controls peach leaf curl and twig borer; controls apple and pear scab; may be used in combination with arsenate of lead.

ORCHARD BRAND

Bordeaux mixture made of the highest grade materials adapted for treatment of deciduous fruit trees, citrus trees, grape vines, and berry plants.

UNIVERSAL BRAND

Miscible Oil and Soluble Oil for thrips control, and insecticidal value in killing scale insects. Both are highly concentrated and effective.

ORCHARD BRAND

Arsenate of Lead in both paste and powder forms — standard spray material for codling moth control — manufactured in California. Supplied promptly in good condition, convenient for use, widely known, thoroughly reliable and sold for reasonable prices.

ORCHARD BRAND

Lime Sulphur Solution is of maximum concentration, free from sediment, convenient and is the best known material for general dormant spraying on deciduous fruit trees and to control peach leaf curl, twig borers, brown rot of apricot, etc.

ORCHARD BRAND

Atomic Sulphur is the most effective fungicide for the control of powdery mildew on fruit trees, vines, truck, grapes and ornamental plants.

Write for our free booklet on insecticides and fungicides. Tell us about your orchard troubles—our entomologist will write you fully, giving helpful suggestions, based on years of experience in Pacific Coast Orchards.

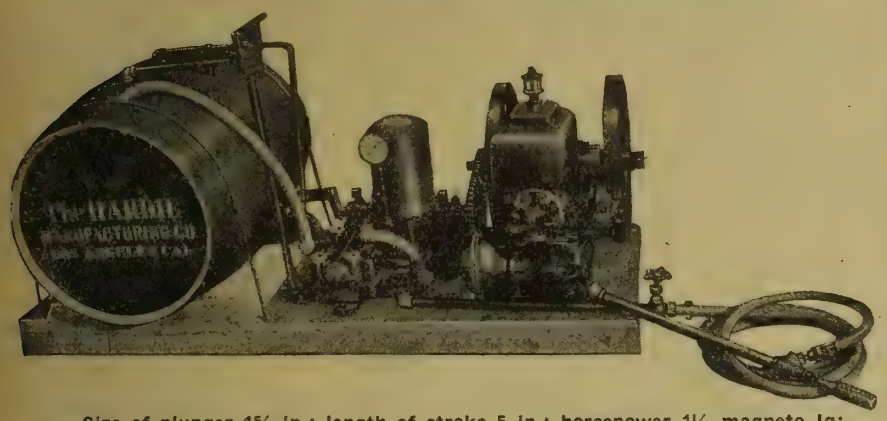
No. 1000 BABY JUNIOR



Size of plunger 1⅝ in.; length of stroke 5 in.; horsepower 1½ magneto Ig; speed of pump 60; capacity 4½ gal. per minute; wood frame; working pressure 225 lbs.

OUR SPECIAL FOR SMALL ORCHARDISTS

This Famous Junior Power Sprayer

is in use in every fruit section of AMERICA. For satisfactory service and low upkeep cost it can't be beat.

Its low price makes it available to the small grower who has thought he could not afford a power sprayer. In fact, thousands have seen in this HARDIE JUNIOR POWER SPRAYER their opportunity to get away from the hard work of hand pumping and the inefficiency of low pressure hand spraying.

When you buy a sprayer you don't want to experiment, you want one that will give satisfaction; that is what a HARDIE will give. They are built to stand up and render satisfactory effective spraying.

SPECIFICATIONS:

1. Engine—1½ h. p. HARDIE Magneto ignition.
2. Pump—Famous HARDIE Junior pump.
3. Tank—50 gal. barrel, fitted with mechanical agitator.
4. Regulator—HARDIE relief valve.
5. Drive—Steel roller block chain running on steel cut sprocket.
6. Equipment—25 ft. HARDIE best spray hose fitted with "Stay-there" hose clamp, one angle cut-off, one Vapo nozzle, one 10 ft. bamboo spray rod.
7. Price—$270.00 F.O.B. Los Angeles.
8. Weight—500 lbs.
9. Hardie Gun instead of rod, add $5.00.
10. Truck—add $60.00.
11. Duplex pump instead of Hardie Jr. pump, add $25.00.
12. Rapid tank filler, add $25.00.

Raise Every Chick

MILLED especially for the critical first few weeks' feeding, OLYMPIC Chick Mash with *Dried Buttermilk* is proper baby feed for your chicks.

Blended by successful poultry feeders to develop money-making fowls—OLYMPIC Chick Mash with *Dried Buttermilk* directly builds muscle, bone, flesh and vitality.

OLYMPIC Chick Mash with *Dried Buttermilk* contains the following wholesome ingredients: Corn Feed Meal, Linseed Oil Meal, Meat Meal, Oat and Barley Flour, Alfalfa Meal, Flour Middlings and *Dried Buttermilk.*

Dried Buttermilk, a most important ingredient, supplies sufficient lactic acid to practically eliminate the danger of White Diarrhœa or bowel trouble. It disinfects the alimentary canal and removes poisonous irritants.

You can count your chicks as soon as hatched by feeding OLYMPIC Chick Mash with *Dried Buttermilk.*

Adventuring With Chickens

By Jean A. Koethen

DEAR DAD: We have been in such a rush the past two weeks that I could hardly remember my own name, much less sit down and think connectedly. When things happen with us they happen all of a sudden, it seems, and we must get used to getting our bearings by each new star that appears above our horizon.

This time it is pullets. We had planned, as I wrote you, to begin at the beginning and raise our pullets for next year, building our houses as they were needed, brooder house first, then colony houses for the growing pullets, and finally laying houses. It was a lovely plan, and would have worked beautifully if we had not heard of a bargain lot of pullets a Mr. Jones was offering for sale. Of course, if they had not been good stock we would not have thought of looking at them. As it was, we looked and fell. There are 200 of them, as perfect in type and color as anything you ever saw—big, red combs and all—just beginning to "bloom," as the chicken folks say when pullets are about ready to lay. They are from trapnested hens, too, and the price, $2 each, was wonderfully cheap, we thought, for these times. That $400 made quite a hole in the little fund we had put aside for equipment and stock, but we feel sure we did the wise thing. By trapnesting these pullets we can have at least a few breeders ready for next fall, and thus save a year's time.

The next thing was a place to put them. Mr. Jones was selling them to make more room for his flock. He says, and we have heard it from so many others we know it must be true, that hens never lay as well if they are crowded. They ought to have at least three square feet of floor space for each pullet, and four square feet is better. If as little as two square feet per hen is allowed, as happens on some ranches, there must be the most constant and careful cleaning. The slightest lapse in sanitation under such conditions is apt to precipitate an epidemic.

The owner was willing to hold the pullets a week for us, but not longer. As soon as we got home from looking at them Bob took off his coat and began staking out the foundation for the laying house, while I rushed off in the car to look for carpenters. They got to work the next day, and now the house is up and the pullets in it.

We had already decided, after talking with a good many men, and looking at a good many houses, to try the no-yard house—not the extreme type of no-yard house which keeps the birds in flocks of 25, but a house of a little more liberal construction which allows 50 birds to a flock. Our long house is 12 feet wide and at present only 48 feet long. That will divide into four houses or sections, each 12 feet square, which allows 144 square feet of floor space for each 50 pullets, or practically three square feet to a bird. The house faces south and the shed roof is high enough to admit the sun to the whole house. The front is entirely open, except for wire, and the rear is entirely closed, or apparently closed. It looks perfectly tight, and is, as far as drafts are concerned, but instead of being boarded up solid, the lower three feet is built into a separate frame which is hinged at the top, so that in hot weather it may be raised. We had seen a house built on such a plan, only the adjustable frames were covered with tarred paper. Paper did not appeal to us as substantial enough protection, though it is used on many ranches, so we preferred to work out the idea in wood.

Our neighbors have quite overwhelmed us with praise for having designed so convenient a house, and have even brought their friends to look at it. It makes me feel pretty proud to think we Missouri tenderfeet should have achieved something that makes these conceited Californians sit up and take notice, but Bob says, "Be careful, little girl; you know where pride ends," and so I try to be humble. I forgot to say that the floor is concrete, covered first with clean sand, with straw on top of the sand. I'd hate to say what that sand cost us. It looks very nice and clean, and I only hope I shall prove a good enough housekeeper to keep it looking so.

Mr. Jones gave me a nice little lecture the day we went for the pullets. I think his subject might be called "Cleanliness First," though he did not label it. "You see those pullets, Mrs. Brown," he said, "with their red combs and their bright eyes. Now I want to tell you there ain't never been a louse on one of them, and as for mites, why, they don't know what a mite looks like. If they did, their combs wouldn't stay red nor their feathers shiny. Both mites and lice breed in filth and the cleaner you can keep your houses and droppings boards and nests and the bodies of the pullets, the healthier and happier they will be. You wouldn't like to live in a house where bedbugs and cockroaches walked over you at night, would you? Well, you take it from me, the hens don't like that kind of company any better than you do. A few lice you are bound to have unless you dust the hens once or twice a year, but mites have no business in any henhouse. When they get in it is always because somebody hasn't been a good housekeeper. Men don't always know, Mrs. Brown, just what good housekeeping is. They have to learn if they stay in the chicken business, but their ideas aren't very clear at first. Women always know, and so I'm telling you to look after those pullets. Keep their house so clean and sweet you wouldn't mind spending a night in it yourself, and the pullets will be all right." I promised him solemnly that I'd keep them clean, or die in the attempt, and so I have worked out a program, typed it and tacked it on the wall of the feed room. It reads like this, and is for every day:

Scrape droppings boards.
Cover with clean sand or dry dirt.
Put clean litter in nests.
Rinse out water fountains.

Saturday morning: In addition to above, spray roosts, wall, droppings boards and nests with mixture of one part crude carbolic acid and five parts kerosene.

Bob will attend to this routine work unless something more pressing requires his attention, but I can do it on a pinch. Cleaning isn't such a

POULTRYMAN'S CALENDAR—FEBRUARY, THE HATCHING MONTH

Just as December is the best month in the year to the children, so, to the poultryman who loves his work and his birds, there is no month like February. This is the time when eggs are going into the incubators and chicks are coming out, when mails and trucks are loaded with boxes with holes in their tops and an alluring "peep" inside, when folks build air castles and dream dreams, castles which sometimes melt in thin air and dreams which never come true, but at least they are built and dreamed. This is the month when the hurrying crowd on the city street stops to cast longing eyes in at a window where a hundred "fluffy ruffles" are playing around a black stove mother, then looks again, and rushes in and rushes out carrying that mysterious box; when every broody biddy is given her way and a clutch of eggs; when the incubator men are happy and the hatchery men count their chicks and their profits with scientific certainty. Welcome February, and hatching time!

job if you only do it regularly.

Next time I will tell you how we worked out our feeding program. With love to everybody, Bessie.

Poultry Queries

Conducted by J. A. Koethen

Feeding Milk

What is the best way to feed milk to chickens, and in what proportion should it be fed?—Beginner, Orland.

If you have sufficient milk to keep it before your hens and chicks all the time in drinking pans it takes the place of other animal food. If you have not, and most poultry people have not, the best way to feed it is to use it to moisten the mash once a day. Keep a dry mash before them at all times in the hopper and, in addition to this, some time during the afternoon (early is best) wet up some of the mash with sour milk so that it is crumbly wet, not sloppy, and feed in trough just what the birds will clean up in 20 minutes. For chicks the milk may be used to moisten the mash once or twice a day or may be kept before them in pans. Sour milk or buttermilk is preferred to sweet milk because of its therapeutic value, but dry bread moistened with sweet milk is a very good nursery feed for baby chicks.

Blue Andalusians

What are the standard markings of Blue Andalusians? Please give me any other information you can concerning this breed. —Beginner, Orland.

"The typical Andalusian," says the 1910 standard of Perfection, "must be preeminently a symmetrical, graceful, compact fowl, of medium size, without coarseness of structure or clumsiness of carriage. The dark lacing of the plumage should stand out clearly and sharply. It should not merge into nor blend with the ground color of the feather. The desired contrast is pronounced and well defined. If the ground color is quite dark the contrast cannot be as sharp as when the ground color of the feather is of the 'clear, even, medium' shade required by the Standard." The male Andalusian should have reddish bay eyes, horn beak, bright red comb, face and wattles, white earlobes, lustrous bluish black neck, back and tail and wing bows. The primaries are a clear, even, medium shade of slaty blue; secondaries, inner web a clear, even shade of slaty blue, outer web, slaty blue, each feather having a well defined lacing of a darker shade; wing coverts, a clear, even, medium shade of slaty blue, having a well defined lacing of a darker shade. Tail coverts are a lustrous bluish black; main tail feathers a clear, even, slaty blue with well defined lacing of bluish black. The breast is a clear, even, medium shade of slaty blue, each feather having a well defined lacing of a darker shade. Fluff, slaty blue. Thigh a clear, even shade of slaty blue; shanks and toes, leaden blue. The plumage of the female is slaty blue, not "dark slaty blue" like that of the male. The wing primaries are like those of the male, but the remainder of the wing is "an even shade of slaty blue, darker than that of the primaries; feathers in all sections except primaries laced with a darker shade." Her back is slaty blue, each feather having a well defined lacing of a darker shade; tail, slaty blue, laced with a darker shade; body, slaty blue, each feather having a well defined lacing of a darker shade; fluff, slaty blue; neck, slaty blue laced with a darker shade. In other respects her markings are the same as those of the male. I understand there is some difference of opinion among judges as to which is to be preferred, the lighter or the darker color in Andalusian. If you think of exhibiting you should consult a judge or other expert.

To Hatch Pullets

Can you tell me what mating to use to secure the largest number of pullets?—Subscriber, Oakdale.

There is no sure rule for securing pullets, but poultrymen generally believe that mating an old cock to the largest possible number of pullets is most likely to bring results. By the largest possible number of pullets I mean the largest number he can be mated to with a fair percentage of fertility. An experienced breeder told me that when he wanted the maximum number of pullets he mated early in the spring his most vigorous cock to about 20 pullets. As soon as fertility could reasonably be expected he put a setting under a hen and then tested eggs on the eighth day. If they tested under 75 per cent fertile he reduced the number of pullets and continued to test out and reduce till he found the eggs showed the required fertility.

Best Incubator

What kind of incubator is best? Is the electric better than others?—Subscriber, Oakdale.

There is no "best" incubator. Some are better adapted to certain localities and some makes are better than others, but there is an argument for every kind. Some big hatcheries now use electricity, but I don't know that it is either better or cheaper than hot water or hot air. Much depends on the man who runs it and the climate in which it is used. The best way to find out what incubator does the best work in your neighborhood is to ask other poultrymen what they are using.

Hoganizing

I am thinking of culling my hens by Hoganizing. Can they be Hoganized at any time of the year? Is it possible to Hoganize pullets ten months of age and not discard good layers?—Subscriber, Manteca.

I hardly think you are using the words in their exact significance when you speak of "culling by Hoganizing," because culling is one thing and Hoganizing is another. The Hogan system, as I understand it, grades the layers before they have begun to lay, according to certain abdominal and pelvic measurements. If you grade your ten months old pullets now, you ought to be able to pick out those that are not laying and have not laid. Whether you can absolutely pick out every pullet that is not worth keeping is a question I do not care to discuss here, but I know that the men of the poultry division and other experts do not depend on Hoganizing alone. After the pullets have begun to lay they are constantly culled by several tests. Pullets that go broody too soon or too often, pullets that stop laying without good reason, or that show signs of weakness, are removed. Then, along in the spring, say May or June, they are culled by color, those whose bright yellow shanks and earlobes show that they have not been working hard being removed. From July on the early molters are removed. If the pullets have been Hoganized at the beginning these other tests should remove the unfit. As for the older hens, I suppose they can be Hoganized at any time, but you should find someone who understands the system thoroughly to do it for you.

Chicken Ticks

I have an old shed badly infested with chicken ticks which I wish to rebuild. Is there any method of treating the boards to kill these ticks?—Subscriber, Richfield.

There are plenty of things that will kill the ticks if you can only reach every tick and every nit. Crude carbolic acid, undiluted or diluted with kerosene, or any of the cresol preparations will do it. Probably whitewash containing crude carbolic acid will do it. The problem is to hit every tick. If you paint on the insecticide with a brush, and there are no cracks or holes where the pests can hide, perhaps you can kill every one, but you will have to paint every inch of the board, and go over it two or three times.

Cleaning Out Windpipe

Mrs. L. S. Bassett of Escondido, who says that with the help of a 15 year old schoolboy she is caring for 500 chickens, sends us the following interesting account of her method of treating choking chickens, which will no doubt be helpful to many readers:

"Having been told that when a hen

Condition Your Breeders

Mating Time Is Here

Make sure that the parent stock, your hens and roosters, are in the pink of condition at mating time. Then they will impart health and vigor to the offspring. See to it that your breeders receive in their daily ration

Dr. Hess Poultry PAN-A-CE-A

It puts the Breeders in Fine Condition

You get strong livable chicks.—Chicks with power of resistance—Chicks that will not fall a prey to every little-chick ailment.—Chicks that will develop into early broilers—Pullets that will develop into fall and winter layers.

SPEED UP EGG PRODUCTION during winter with Dr. Hess Poultry Pan-a-ce-a. It contains tonics that promote a hen's digestion, tonics that tone up the dormant egg organs—so that the proper amount of food goes to egg production—and not all to flesh and fat and laziness—when it's action and eggs you want.

Always buy Pan-a-ce-a according to the size of your flock. Tell your dealer how many hens you have. He has a package to suit. Results guaranteed.

30c, 60c and $1.25 packages. 25 lb. pail, $3.50. 100 lb. drum, $12.00. Except in Canada.

"Buttermilk Babies"

LET your chick babies be buttermilk babies this year and watch 'em thrive and grow. Start them right, start them on Globe "A-1" Baby Chick Mash, **the buttermilk baby chick mash.**

There is practical and scientific knowledge put into Globe "A-1" Baby Chick Mash. It isn't just a feed. It's that and more—a health protector. The generous quantity of pure dry buttermilk which it contains gives it this invaluable property. The lactic acid content cleanses the baby chick's system, and protects it from the ravages of disease. **(It has proved a preventative of white diarrhoea and coccidiosis).**

AFTER THE CHICKS ARE OLDER

After your chicks are about 6 weeks old change the ration to Globe "A-1" Growing Chick Mash (containing dry buttermilk) and when the pullets are 5 months old begin to feed Globe "A-1 Laying Mash (containing dry buttermilk) and get ready for the full egg basket.

Nutritious hearts of grain, meatine, selected ground grains **and plenty of pure dry buttermilk**—that's Globe "A-1" Baby Chick Mash—why shouldn't the chicks grow well on it?

GLOBE A-1 GUARANTY

"Money's Worth or Money Back"—a guarantee as sound and as liberally made as are Globe A-1 Feeds. If you are not pleased to have our Product, we are not pleased to have your money.

Your Dealer cheerfully backs this guarantee.

San Francisco Sacramento Colton Ogden Los Angeles San Diego

GLOBE "A1" Baby Chick Mash

began to cough or choke she was doomed, I began to experiment for myself after dissecting one whose windpipe was filled with cheesy matter. Being doubtful whether spores had collected from moldy feed or the condition was a bad case of roup, I watched the flock closely and from time to time, when I found one gasping, I immediately cleaned out the windpipe by this method: Grasp neck so as to push tongue and windpipe to front of mouth, and with a toothpick wrapped with cotton dipped in a weak solution of iodine, clear the cheesy matter out with one motion of the hand, if possible. If it cannot be done with one motion, allow the hen to breathe and try again, swabbing well afterward with iodine, but being careful not to allow any to go down the windpipe. This may sound complicated and like a waste of time, but I considered a dozen hens worth saving. I treated them once or twice in this way and had them laying again in three weeks. If I had vaccinated them after the treatment they would have been laying even sooner. I have tried it with other birds. Boys and girls on a ranch can be taught to treat fowls and animals with great benefit to themselves and saving of time for their parents."

Red Caps

Can you tell me where I can get French Red Caps?—Subscriber, Oakdale.

Speak up, Cultivator readers. Who has Red Cap chickens? I have never seen them at the shows.

Book Review

RABBIT BOOK

"The Rabbit Book," a practical manual on the care of Belgian hares and other meat and fur producing rabbits, by F. L. Washburn, University of Minnesota, published by J. B. Lippincott Co., Philadelphia, at $2.00 net.

"In view of the need of cheaper meats which are not only cheap but nutritious, and because the rabbit raising industry is now for the most part on a proper basis, namely, that of supplying meat and fur, it seems fitting that some comprehensive work should be placed before those interested which may serve as a guide to the uninitiated and as a work of reference to the professional."

The above is from the preface of the book which consists of 200 pages of excellent text fully illustrated. Illustrations of various types of animals—with a colored plate showing practically all of the domestic rabbits—rabbit hutches, hutch cleaners and various other appliances, are followed by a glossary and index making it possible to turn to description of any phase of rabbit keeping. There are 12 chapters touching upon strains of domestic rabbits and standards, stock, management of rabbitry, feeding, breeding, killing and dressing, recipes, diseases and remedies, rabbit fur, preparing skins, tanning, etc., selling, shipping and exhibiting. The present interest in cheap meat and the high prices of fur combine to make a long demand for this book.

MARIOUT BARLEY BEST FOR FEBRUARY PLANTING

Exhaustive experiments at Davis, supplemented by experience of practical farmers, have shown that Mariout barley possesses the greatest advantage over common barley when planted during February and March, says Professor G. W. Hendry of the university farm. Mariout is an early ripening dwarf variety which consumes less soil moisture than the common barley and completes its growth earlier in the spring before the ground has lost its moisture. It possesses about the same advantage over common barley for spring planting as common barley does over Club wheat, and the reason is assignable chiefly to the same cause, namely, its earlier maturity. Many Sacramento Valley grain growers have learned the special fitness of Mariout for spring planting and are substituting it for Tennessee Winter and common barley in all plantings subsequent to January 15, even on the heavier soil types.

BUYING SECOND HAND CARS

By B. H. Wike

Some folks are very much prejudiced against buying anything second hand, probably for the reason that they have either been deceived themselves or have seen a few cases where others have been. Now buying second hand cars presents a rather queer angle to the situation, for the main reasons that one never knows whether such a car is worth the price asked or whether it will run at all after it gets out of the owner's hands. Sometimes one strikes very rare bargains in second hand cars, and if one is careful there is little danger in being "skinned" any more than in other buying.

Making Mechanical Inspection

Unless you are skillful enough to make thorough inspections of a second hand car's condition, it will be better for you to take along some friend who is a mechanic and who can be trusted. The main thing you will want to know is what the mechanical condition is, whether any parts are on the verge of a breakdown or even badly worn. There is no way sometimes of knowing this except to get the car on the road for a trial. Of course you will have to make deductions and comparisons between this and a brand new one, for if the price is any indication at all to judge by, the car's action in running will doubtless tell the truth. Notice how the car accelerates. If there is any trouble in this respect it will likely show either leaking piston rings or a carburetor in poor shape. Even if it accelerates well enough, advance the spark suddenly on a slight pull and notice whether the connecting rod bearings show wear and looseness which will then indicate by a hammering sound confined to such cases. Also notice whether the gear shifts smoothly, as this will, if you are careful in shifting, indicate whether the gear teeth are nicked. A nicked condition of the teeth will cause some trouble in shifting. If the gears are worn there will be back lash which is found by stopping the engine, setting the gear lever to some position, say low, and trying to roll the car back and forth. It may be found, too, by driving on the road, accelerating somewhat and then checking by quickly throttling down, again repeating the process and noting the jerky and uneven movement.

Catch hold of the rear wheels and shake them in, and out to determine looseness of the rear axle shaft. This condition may be noticeable in running on the road by a chuckling sound on uneven tracks. Look the springs over for indications of broken leaves. See whether oil leaks too much from the motor cavities and grease from the transmission and differential housings. Jack up the front wheels and test for worn bearings and bushings both in the hub and the steering knuckle. See how much play is indicated in a movement of the steering wheel while the front road wheels stand on the floor or ground.

Electric Equipment Important

If there is a battery in the car, see what its condition is, whether the generator gives it charge and whether its condition tests well enough to warrant going a time longer. Don't, however, pin your faith in the whole car's condition to just what the battery's shape is, because a storage battery is no indication of good mechanical parts and actions. The general electrical condition should not be passed by, for a car is no better many times than its electrical equipment, for upon the spark depends the regular firing of the cylinders, and there is also likely provision for lights and starting. The various units like the generator and starter should be inspected and of course you will have to make allowances if either of these are found in need of overhauling.

By careful attention to all points outlined it should not be difficult to decide to the best advantage about second hand cars. If you make a thoughtful examination before you buy, it does not seem reasonable to complain after you do buy one.

The state farm settlement at Durham recently received a delegation of stock breeders of the Delhi land settlement in Merced County.

JOIN THE NEIGHBORS AND GET WOODCUTTING OUTFIT

A drag saw or buzz saw will enable a farmer to cut as much firewood in a few hours as he can cut in a week's hard work by hand. Many farmers already have gasoline engines and small tractors suitable for furnishing the power for wood sawing machines, and a power wood saw is not an expensive piece of machinery.

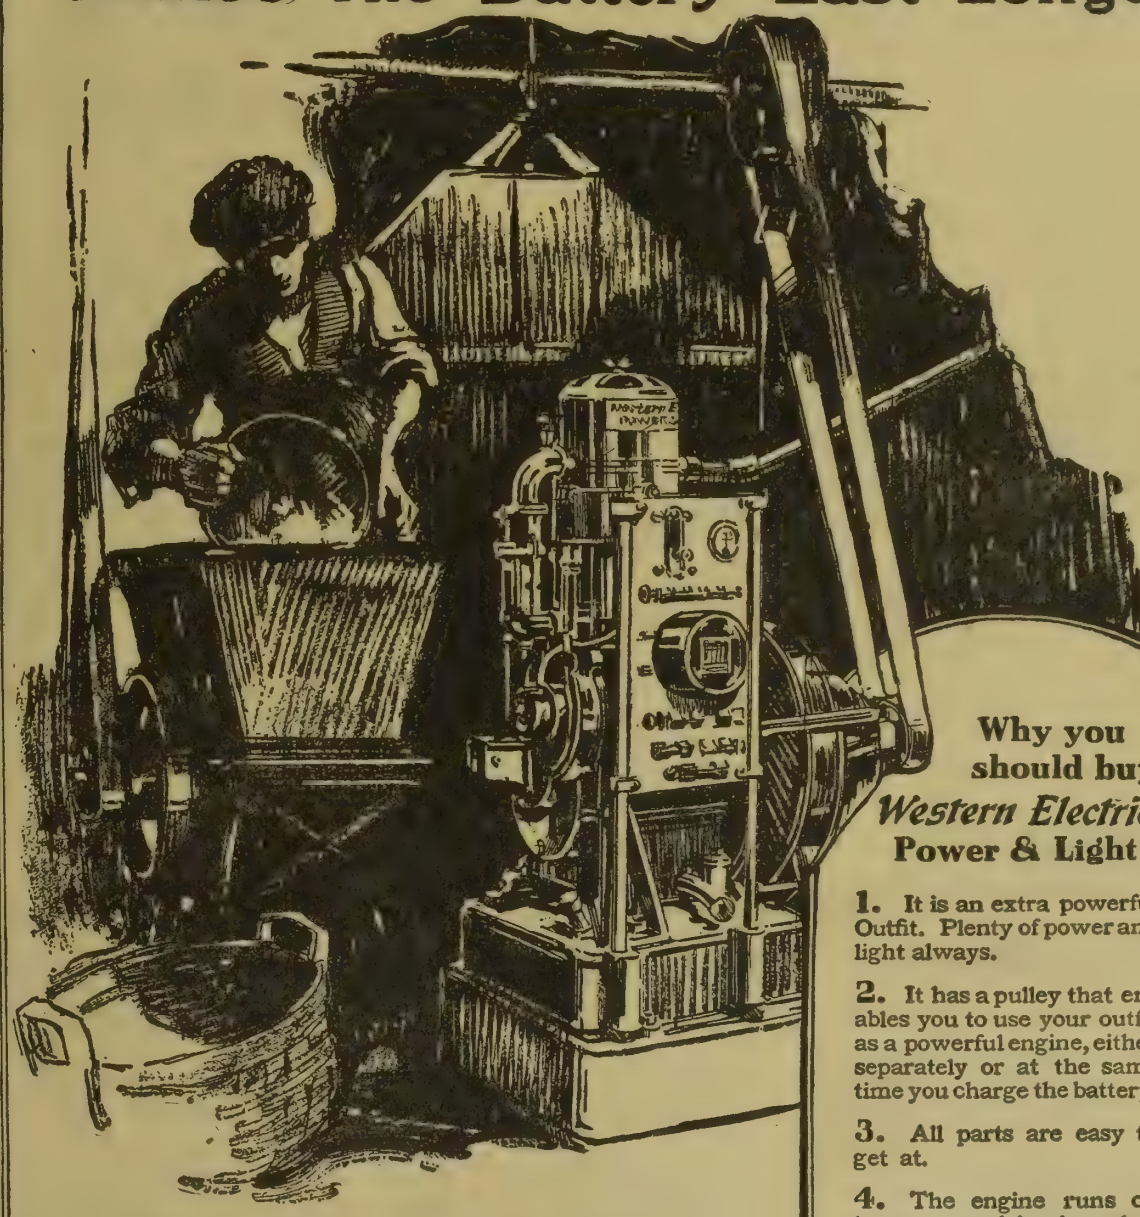
There should really be a portable drag saw outfit in every neighborhood to enable farmers to cut logs which are too heavy for them to roll and skid and also a buzz saw for cutting cordwood and long poles into firewood. The portable drag saw outfit is most efficient in cutting larger logs, but it cannot compete with the circular saw on wood less than ten or 12 inches in diameter. The logs to be cut with the drag saw do not have to be lifted off the ground and handled as much as if they were to be cut with a circular saw. A drag saw for the larger logs and a circular saw for the tops and smaller poles makes a very efficient combination.

It will not, as a rule, be profitable for a farmer to purchase an outfit for use in cutting only his own wood. Several farmers should combine in the purchase and use of a complete wood sawing outfit, and the outfit will pay for itself in a few years. The owners will usually find it possible to cooperate in the actual work of cutting the wood and there will be no cash outlay for hired help.

Washington is now the greatest apple producing section of the world. Though in 1920 New York produced slightly greater amount of fruit, young trees coming into bearing guarantee to Washington a long lead in the 1921 crop.

Western Electric Power & Light

Makes The Battery Last Longer



Why you should buy *Western Electric* Power & Light

1. It is an extra powerful Outfit. Plenty of power and light always.

2. It has a pulley that enables you to use your outfit as a powerful engine, either separately or at the same time you charge the battery.

3. All parts are easy to get at.

4. The engine runs on kerosene and is air-cooled.

5. The "tapering charge" makes the battery last longer.

THE BIGGEST LITTLE THING

you can do for baby chicks

Sperry Baby Chick Mash

This is a new Sperry Product to meet a growing demand—a product that is up to Sperry Standards of Quality. We are packing this feed in 50-lb. and 100-lb. yellow-striped bags. Your dealer can supply you.

—is to give them clean, prime feed. The poultryman who recognizes the importance of this rule is sure to save a big percentage of his hatch. The poultryman who ignores it is bound to lose.

Prime grains mean *clean* grains, free from smut, mould and other damage. Cleanliness is of prime importance in feeding baby chicks. In making SPERRY BABY CHICK FEED we keep this constantly in mind. During its entire process of manufacture the same absolute cleanliness is observed as in manufacturing Sperry Red Package Cereals for your table.

The formula for SPERRY BABY CHICK FEED is based on this full-grown idea: nothing is good enough for a baby chick that, under other conditions, would not be good enough for a human baby. These little bits of chick life require a feed that is granulated and proportioned for their delicate digestive organs. Their fast-growing bodies demand a uniform, balanced ration that supplies *all* the food values Nature intended a growing chick to have.

And SPERRY BABY CHICK FEED gives it to them! That's why they thrive on it. In the first few weeks of their lives this clean, prime feed comes to these chicks and gives them a firm foundation: a foundation on which to build their future egg-production—and your very profits. In short—it gives them the *right start*. And that means everything—to the chicks and to you!

Seasoned poultrymen will tell you that the slight difference in cost between poor feed and SPERRY BABY CHICK FEED means nothing—especially when you appreciate that the saving of a very few chicks more than makes up for it. And—here's another typical Sperry economy:

New improved machinery makes absolutely certain the *proper granulation* of SPERRY BABY CHICK FEED. This avoids the waste in actual feeding that is bound to happen with feed too finely ground.

Our booklet, "Makes Hens Happy," devotes quite a bit of space to this all-important subject of baby chicks. Thousands of successful poultrymen have found it a big little help. We'll send it gladly on request. Don't bother to write a letter—simply clip the coupon and mail today!

The Commercial Avocado Orchard Has Become a Fact

This orchard scene is in the foothills above Duarte and shows vigorous uniform trees now making liberal financial returns to the owner. The cover crop is of barley. Presumably a much heavier covering would have been secured with rye. See article by A. D. Shamel on third page of this issue.

Soil Acidity Is Detrimental to Crops

You Can Correct It and Establish a Desirable Soil Condition by Using

FREE SAMPLES DISTRIBUTED

Attend the National Orange Show, San Bernardino, Calif., February 18th to 28th. If you will mention this Announcement when visiting our booth, you will receive a generous free sample of D. M. S. LIME for experimental purposes.

Order from Your Nearest Dealer

SOIL experts everywhere agree that an acid soil condition is detrimental to crop growth. The acid prevents the proper action of other beneficial elements necessary to the growth and development of vegetation. Soil acidity retards plant growth, stunts it in the proportion that it is acid, causing unprofitable crops. Many California soils are acid, some entirely and some in spots, but scientific investigation and repeated experiments have proven that the proper corrective is the use of lime.

Among the agricultural authorities who recommend the use of lime for soil acidity, include the University of California, College of Agriculture, which in Bulletin No. 111 says:

"Lime materials make 'sour' soils 'sweet.' Speaking correctly, they change an acid soil condition to a slightly alkaline one. Acidity of soils is very detrimental to the growth of many agricultural crops. A slightly alkaline condition is ideal for them."

D. M. S. Lime will correct the acidity of your soil and increase crop production. It is economical to apply, will greatly improve the condition of the soil and pay for the investment in better returns and lasting soil improvement.

Another beneficial use of D. M. S. LIME is found in the development of beneficial bacteria. Bulletin No. 111 on the use of lime says: "Lime materials are necessary for the useful and beneficial bacteria and other microorganisms of the soil. It furnishes these elements, calcium which is as essential to them as to the higher plants. . . . By its physical effects lime produces good air and moisture conditions for bacteria."

One of the most general uses of lime on California soils is to make clay and clay adobe soils looser, to prevent their packing, baking and cracking. Lime on such soils makes plowing and cultivating easier and makes them more pervious to water.

On Account of Its Accessibility and High Analysis D.M.S. Lime Is the Most Economical Lime Available in Southern California

Nature has richly endowed California with this much needed fertilizer and soil tonic. Ages ago, a few miles south of what is now Los Angeles, there was deposited a calcareous ooze which time and the elements have converted into DECOMPOSD MARINE SHELL LIME (Calcium) 96.39% pure, in a most soluble and otherwise perfect condition for agricultural and comercial purposes. A paved highway extends to the Plant, equipped there to yield the rich treasure AT A PRICE THAT EVERYONE CAN AFFORD.

D. M. S. LIME is available by truck at the Plant or through your local dealer. It is an economical and expedient soil tonic and fertilizer. Your crops cannot fail to show improvement by its application. Soils inclined to bake or behave as clay soils do, will become mellow and more pervious to the application of water when treated with D. M. S. LIME. Water will permeate deeper into the soil and render greater service where lime is present and the calcium is one of ten necessary elements for crop production. It is easily applied by sowing broadcast or with a drill, from 500 pounds to two tons per acre, according to the condition of the land.

Order today and take advantage of this highly beneficial, low priced material as many others are. If your local dealer cannot supply you, write us direct.

DEALERS MAY ARRANGE TO HANDLE ORDERS AND SHIPMENTS BY WRITING TO OUR LOS ANGELES OFFICE.

Avocado Tree Records

By A. D. Shamel

THE California Avocado Association has recently established a bud department. The purpose of this department is to assist propagators and growers in securing reliable budwood from superior parent trees carefully selected on the basis of their performance records. The manager of the bud department is Miss R. Agnes McNally, secretary of the Avocado Association, whose address is Altadena.

Owing to the fact that the avocado industry is as yet in its infant stage of development, the commercial value of the crop is comparatively small. For this reason it has been difficult to secure adequate funds to finance work such as has been planned by the bud department of the association. With little funds available for carrying on the bud selection work, it is absolutely necessary that the avocado growers cooperate fully in the way of securing individual tree performance record data which can be used as a basis for the intelligent selection of parent trees for propagation. There are no funds available for carrying on independent tree record work, so that all the bud department can do until such time as more funds are available is to assist growers in laying plans for obtaining individual tree records of fruit production, to advise with them as to the adaptation of methods to particular local conditions, and to aid in tabulating, analyzing and interpreting the data after it has been secured, in order to locate undesirable trees for top working or replanting, and wherever possible to select superior parent trees for propagation.

Some of the leading avocado growers with whom the writer is acquainted are keeping individual tree records for their own information and for the benefit of the industry. These men are devoting a considerable share of their personal time to this work, which is, as a matter of fact, a public service in that it is likely to benefit the industry as a whole as much or more than their own interests. Such men who give their time and bear the expense of securing reliable and definite information as to the avocado variety, strain and individual tree behavior will sooner or later come to be looked upon as the real founders of this industry, which in time seems destined to be an important one.

There are continual accessions to the list of leading avocado growers by reason of new plantings or the extensions of old ones. It is to these men in particular, as well as any others who have not become interested in helping establish this industry upon a sound foundation, for one reason or another, that the writer wishes to appeal in behalf of cooperation with the bud department of the avocado association in the work of securing systematic tree records.

The list of avocado varieties recommended for propagation in California by the avocado association and a brief description of their more important characteristics are as follows:

These varieties stand out as the most valuable ones to date in the experience of the avocado association. There have been some individual tree records kept in plantings of each of these varieties as well as in others of varieties not represented in this list. These data have furnished invaluable aid in deciding upon the relative merits and value of the varieties studied and in making possible recommendations of certain varieties for propagation with some confidence. The writer is of the opinion that before any variety is officially recommended by the association for propagation an adequate number of tree records should be secured which will demonstrate definitely the tree and fruit characteristics of the variety. In order to make these records of the most value to everyone concerned the cooperation of the bud department in this work should be requested. It seems probable that with further experience the present list of recommended varieties may be enlarged and changed as warranted by more complete knowledge of the behavior of the numerous varieties now being tried out both experimentally and commercially. Further information concerning the varieties now recommended by the association can be secured by reading Circular No. 2 of the California Avocado Association, which was issued August 1, 1920.

The object of individual avocado tree performance records is to secure definite information as to tree behavior and fruit characteristics. These data will furnish reliable information to the growers as to the value of the trees which they are growing and to the industry as a whole as to the relative merit of varieties for propagation in order that a few standard varieties can be intelligently selected for commercial planting. Such records will also enable propagators to locate the best performing individual trees of the standard varieties so that wherever desirable reliable budwood can be secured for propagation. If these records are kept in cooperation with the bud department of the association they will be accepted as unprejudiced information for the guidance of growers, planters, propagators and everyone concerned.

The avocado individual tree performance records should provide for a record of the number, weight and commercial quality of the fruits borne by each individual tree; the dates of each pick which will show definitely the season of fruit production under the conditions of culture; the weight of seed; the shape of the fruit; the color of the mature fruits; and descriptions of any striking variations in the tree or fruit characteristics.

The fruits can be weighed individually as they are picked or, as is usually more practicable, the fruits of each pick from each tree may be weighed as a whole. This weight divided by the number of fruits will give the average weight of the fruit from each tree at each pick.

Sample fruits from each tree should be examined occasionally in order to determine the size and weight of the seeds. These data can frequently be secured from fruits consumed locally in order to avoid too great loss or expense. The size and weight of avocado seeds are particularly important fruit characteristics and enough definite data should be secured from a reasonable number of sample fruits to give reliable information on this point.

The shape of the fruits is important from the marketing standpoint as well as from other considerations. In describing the characteristic shape, uniform terms should be used in order to avoid confusion. Uniformity of shape in the crops of fruit borne by a tree is a very important factor in that it may be interpreted as indicating a stability of type in the trees producing uniform fruits, and particularly in that it enables the growers or packers of the fruits to pack them to the best advantage and offer for sale attractive and uniform appearing packages. As the industry develops, the packing of uniform standard grades will likely have a more and more important influence upon the distribution of the fruits and the prices received for them.

The color of the fruits and the texture of the rind are characteristics which should be recorded in the individual tree performance record data. As the decision to buy fruits is often strongly influenced by their appearance, it is but natural that their color and texture should become a matter of commercial importance. This is particularly true when the color or texture of the fruits are such as to command the favorable attention of the buyers and when striking enough to identify the variety of the crop.

In any attempt to secure commercial

(Continued on Page 243.)

One of the Five Approved Varieties

An eight year old Dickinson showing typical growth and vigor of tree. By observing closely it may be noted that the tree is heavily loaded with fruit. Its fruit is of the very best quality.

Varieties	Season Dates Inclusive	Wt. of Fruit in Ounces	Wt. of Seed in Ounces	Shape of Fruit	Color of Mature Fruits
Fuerte	Jan. to April	10 to 16	1½ to 3	Pyriform	Dull Green
Spinks	Mar. to Oct.	16 to 20	2 to 3½	Obovate to Pyriform	Purplish Black
Dickinson	May to Sept.	14 to 20	1½ to 2½	Obovate to Pyriform	Dark Purple
Sharpless	Sept. to Jan.	16 to 20	2 to 3	Pyriform	Dark Purple
Puebla	Nov. to Jan.	6 to 14	1½ to 2½	Pyriform	Dark Purple

A Good Beginning

Many have the impression that the avocado is most deliberate in coming into bearing. Variety and a well budded tree on vigorous root, however, make for earlier return. Here is a small tree still in the nursery row with five big fine fruits.

Agricultural News Notes of the Pacific Coast

Northern California

A fish hatchery is to be constructed at Johnsville, Plumas County.

Pleasanton, Alameda County, is planning for large extension of sugar beet planting.

Hayward prune and apricot growers are in the midst of their sign the contract campaign.

Esparto, Yolo County, reports largest acreage of almonds in the state and large planting this season.

Modoc national forest will have pasturage for 42,000 horses and cattle and 87,000 sheep and goats.

The Nevada County farm bureau is planning for an agricultural fair to be held sometime next autumn.

Farm Adviser Amundsen of Placer County is sending out spray calendars to members as a timely warning.

Greenville Valley in Plumas County reports 35 inches precipitation and the valley still packed with snow.

One of the largest sugar refineries in the world is to be located at Crockett by the California-Hawaiian Sugar Corp.

Grass Valley, Nevada County, reports over 50 inches of rainfall up to February 1. This is the largest in many years.

The farm bureau at Durham, Butte County, has appointed a committee to investigate advantages of bulk handling of grain.

Sportsmen are opposing possible action of the state legislature in changing opening date for trout fishing from April 1 to May 1.

Horticultural Commissioner Gould of Yolo County reports that 500 additional acres will be planted to grapes the coming season.

Sutter County's planting of peaches has been the largest in many years, this because of the exceptional profit of the past two years.

Cloverdale, Sonoma County, alfalfa planters complain because of much alfalfa seed sent to that county seriously infested with dodder.

A public auction sale of state scrip will be held by Surveyor General W. S. Kingsbury at the state capitol, Sacramento, Monday, March 7, 1921, at ten a. m.

Yolo County hop growers are discussing advisability of extending hop planting. They have learned that European countries are extending their plantings.

Farmers and stockmen of Shasta County have had several conferences on what should constitute a lawful fence. So far no general agreement has been reported.

The Sutter peach growers have decided to build a cooperative cannery in Marysville. It will cost in the neighborhood of $250,000 and will have a capacity of 4,000 tons.

Humboldt County is appealing for saving the redwoods along the state highway through that county. Small groves totaling over $100,000 in value already have been purchased to be preserved for their beauty.

In a recent address at the Durham land settlement Dr. Elwood Mead, who has just returned from an Eastern trip, said that 30 state legislatures are now considering state land settlement according to the California plan

Central California

A poultry show was recently held at Dos Palos.

Stanislaus County grain farmers are discussing elevators.

Turlock's first full car of cotton was shipped Thursday, January 27.

California Peach and Fig Growers have installed vacuum fumigators.

Fresno chamber of commerce is boosting the olive eating campaign.

Newman, Stanislaus County, is organizing a new dairymen's association.

At the raisin growers rally held at Dinuba recently over 500 people were in attendance.

Castroville, Monterey County, has been fining owners of cows pasturing on the highways.

Fresno County American Legion has endorsed the work of the Japanese Exclusion League.

The new contract between the California Peach Growers, Inc., and members is being liberally signed.

Stanislaus County Holstein breeders are to entertain President Aitkens of the national association this week.

Kern County farm center meetings: Mountain View, Monday, February 21; Pond, 23; Inyo-Kern, 24; Rosedale, 25.

Stanislaus cow testing association reported 1,138 cows in the January test; 83 were admitted to the roll of honor.

Dos Palos, Merced County, has just closed its first annual poultry show and claims to be the Petaluma of the West Side.

Certain Kern County farmers are opposing the petition of the Miller & Lux people for a reclamation district in the vicinity of Buena Vista.

Hickman-Waterford farm bureau center is securing a large number of new members for the county bureau.

Delhi, Merced County, is expecting an appropriation of at least $250,000 for the completion of the development of the land settlement.

The average runoff of the Kern River for February is 45,000 acre feet. This increases until May, when it will reach 163,000 acre feet.

San Joaquin Valley wool growers have organized. John Bidegary is president. The valley has an output of about $1,250,000 in value.

This is Stanislaus County farm bureau membership drive week. There are five teams at work with some 20 to 50 members on each team.

The Pine Flat irrigation scheme is being gradually made more certain. During the past few weeks the canal company's holdings have been purchased.

The secretary of agriculture has authorized the grazing of 29,750 head of horses and cattle, 6,000 sheep and 600 swine in the Sequoia national forest. The annual fee is $1.40 for cattle, $1.75 for horses, $1.05 for swine, and 35 cents for sheep.

The newly elected directors of the Central California Milk Producers Association are: W. J. Hackett, Ceres; W. H. Fowle, Denair; H. A. Stammerjohan, Turlock; J. H. Minto, Patterson; Mrs. S. G. Reynor, Lathrop; C. B. Hageman, Ripon; O. J. Muscio, Lockeford, and R. L. Holmes, Modesto.

Southern California

Total count of Orientals in California, 100,963.

"Double the membership" is Ventura County's slogan.

Every rancher in the Ocean View district of Ventura County has joined the farm bureau.

A recent orchard census shows Riverside County to have 1,417 acres of bearing olive trees.

At Coachella on January 9 there was organized the California Cooperative Date Growers Association.

Dairymen of Los Angeles County have reduced price of milk delivered from 18 to 16 cents a quart.

Bee Inspector Pleasants of Orange County reports all bee colonies in the county in healthy condition.

One of the smaller coasting boats recently took on a load of 250 tons of Lima beans at Hueneme, Ventura County.

Chamber of commerce of Santa Ana is making protest against children under 16 driving automobiles on the highways.

Riverside County has adopted an ordinance requiring all bee colonies to be registered with the county assessor within 60 days.

Hemet-San Jacinto cooperative poultry associations met recently and planned purchase of grain and other feeds in carlots.

Visitors from all parts of the South visited the Banning-Beaumont section last week to see the extensive almond orchards in bloom.

The annual meeting of the California Citrus Institute will be held in the Elks club rooms, San Bernardino, February 25 and 26.

Cotton growers at Blythe, Riverside County, who are able to secure only $5 per ton for their seed, are using it for fuel. It burns much like coal and is superior to wood.

E. D. Palmer, manager of the Orange County Fruit Exchange, announces such large increase in membership that another association must be organized at once, with headquarters probably at Orange.

The Riverside Beekeepers Association has withdrawn the reward of $25 for arrest and conviction of anyone setting fires on the ranges because the public is now impressed with the importance of fire prevention.

At the annual meeting of the Poultry Producers of Southern California in Los Angeles, January 28, the officers elected were: President, J. M. Davison; vice-president, C. G. Ross, Pomona; second vice-president, Thos. Hurley, San Diego; secretary-treasurer, L. H. Brooks, Los Angeles. 4,103,444 dozen eggs were marketed last year by the association.

The reported dumping of enormous quantities of good lemons in the San Dimas wash has been proven to have a yellow newspaper tinge. In other words, the case was vastly overstated. Naturally, there are some waste fruits which are dumped. The case seems to be, according to the statement of the manager, 450 cars high grade fruit were shipped East and because of disastrous market conditions nearly 400 were sent to citric acid factory and a total of four cars were dumped in the wash.

The Coast and General

New York is receiving large shipments of tomatoes from the Bahama Islands.

The Eleventh Annual Good Roads Congress was held at the Coliseum in Chicago last week.

Fruit shippers at Orlando, Florida, are joining energetically in the fight for lower freight rates.

The East is complaining because of an "open" winter. There has been but little zero weather and a minimum of snow.

The first steamship cargo of prunes from Clarke County, Washington, was sent from Vancouver to Baltimore in 30 days.

Oregon's broccoli crop is ready for shipment. It is estimated that 50 carloads will be shipped from the Umpqua Valley alone.

California, Oregon and Washington show a total of 15,462 pure bred Holsteins, according to figures given out by the national association.

Fruit and vegetable growers of Texas are petitioning the interstate commerce commission to give relief from the excessive freight charges.

It is reported that a recent effort to form an association of independent shippers of citrus fruit from Florida has been abandoned by the promoters.

It is proposed to require nurserymen and plant dealers in Oregon to pay a license of $5 a year. This is now being considered by the legislature.

The Oregon legislature is surely unique among such bodies for it is reported that a surprisingly small number of bills have been introduced in both houses.

Arizona cattle are wintering well, and range, especially in the vicinity of Prescott, is reported in fair condition. New Mexico, on the other hand, is calling for rain.

A bill has been introduced into the Oregon legislature asking for creation of the office of county meat and herd inspector to direct his attention largely to control of tuberculosis.

The British Columbia Fruit Growers Association held its 31st annual meeting at Nelson the latter part of January. Methods of combating the codling moth were given much attention.

London reports the building of 1,000 horsepower aero engine, the most powerful known, and the suggestion is made that it will be used in regular mail service between London and New York.

Farmers of the Willamette Valley of Oregon are asking the legislature to change the present statute so that eradication of Canada thistle will be made possible with less work and expense.

National conference on highway traffic regulation recently held in Washington adopted a set of principles for guidance of state legislatures. The idea is to have more uniform traffic regulation in all states.

Oregon wheat growers met at The Dalles, January 22, to consider the marketing contract prepared by a joint committee from the Farm Bureau Federation, the Farmers Union and the State Grange. The plan is to divide the grain growing sections of the state into ten districts. Contracts will soon be ready for signing.

Foreign Competition in Dates

By Paul Popenoe

PRACTICALLY all of the dates grown commercially in the United States are grown in Riverside and Imperial Counties where they ripen from August to December. A large part of the imported palms now growing there are of varieties that mature late in the season, the Deglet Nur being generally considered the best of these late dates in point of quality.

As the crop becomes larger each year (for the past season estimates run from 75,000 to 125,000 pounds only), marketing will become more and more a nation wide problem and the question of foreign competition will have to be faced more squarely. It seems worth while, then, to consider some of the facts available at the present time, which throw light on the nature and extent of this competition.

In the first place it must be realized that consumption can probably be greatly increased, for the total import of dates into the United States has never been large—only a few ounces per person per year. If the inhabitants of this country ate 365 times as many dates as they do now they would not be surfeited, by Arab standards. The figures as furnished by the department of commerce are:

Year	Pounds	Value
1914	34,078,608	$ 678,527
1915	24,949,374	420,203
1916	31,075,424	547,433
1917	25,485,361	622,934
1918	10,720,852	480,589
1919	36,920,921	1,890,688

It must be remembered that during these years the war and high freight rates made importation difficult and expensive. On the other hand, of these small imports a part were re-exported.

Taking up the foreign competitors in detail, it is evident that, other things being equal, the most formidable is the one nearest at hand for it can put its dates on our markets with the least cost for freight and the least loss of time. The import duty on dates in the United States is only one cent a pound and is therefore not protective.

While northwestern Mexico may eventually become our real competitor, the nearest of the present date exporting countries is North Africa, where the industry has been taken up by large corporations with abundant capital, who are pushing it steadily. The total production of dates in this region must be several hundred million pounds per year. Of this quantity only a small part is suitable for export because among the important date growing regions of the world North Africa is conspicuously poor in choice varieties. Its best advertised export variety is the Deglet Nur which probably owes part of its prominence in the minds of the Algerians to the fact that it has so few competitors in its own country. In competition with the best dates of Arabia it is doubtful if it would create any sensation.

The French growers are specializing on culture of the Deglet Nur. They have the intelligence and taste to handle it well and pack it attractively, and they have cheaper labor than we Californians. Thus, according to a recent statement from the American consul they have been able to put well packed cartons (which contain something less than a pound of dates that by our standards are second grade) on the London market so cheaply that even during the past season the range of the retail price was only from 8½d to 1s 6d, or allowing for current rates of exchange, say, from 13 to 30 cents per box in American currency.

These Deglet Nurs can of course be shipped from Algiers to New York just about as cheaply and quickly as from Algiers to London, and more cheaply than from California to New York, with very little more time, if any, in transit.

It is evident that the growers of the same variety in California cannot compete on this basis. Their costs are vastly higher. The Deglet Nur Date Growers Association of the Coachella Valley has been wholesaling its best pack at $1 and $1.50 per box of 15 ounces, and states that the cost of packing and marketing alone was about 30 cents on each box. This takes no account of the grower's cost of production, which with this variety is relatively high. It is thus evident that with the present methods of handling this particular variety in California, especially in an unfavorable year, it would be difficult to meet successfully any real competition from Algeria.

It may be, of course, that better methods of handling this variety will be adopted. W. T. Swingle of the federal bureau of plant industry states that "about 125 people are growing Deglet Nur dates, but probably not more than 25 of them have had experience in curing the fruit, and I doubt whether more than ten of them have had enough experience to become expert." Something of the difficulties involved with this variety may be understood from a statement by the same writer that "the Deglet Nur, introduced in 1900, fruited in 1903, did not properly mature any fruit until the winter of 1910 and 1911, and the first fruit of high quality was ripened artificially by the slow maturation process in the winter of 1912-1913."

Even under the most favorable circumstances the prospect of French competition from North Africa is serious. The export business there has been getting more and more into the hands of powerful corporations who will not likely long overlook the tempting profits which the American market offers, and will begin to invade more largely the American import field, which has been heretofore in the hands of companies whose principal connections were in the extreme Orient.

While imports from Algeria and Tunisia to the United States are at present small they are steadily growing. Thus in 1913 only ten pounds of the American importation were credited to North Africa, while in 1919 the imports were 3,921 pounds, or about the same amount as the total pack of the Deglet Nur Date Growers Association of the Coachella Valley in 1920. Additional imports credited to France probably represent in large part North African Deglet Nur reshipped at Marseilles—in 1918 there were 9,915 pounds so entered. In the same year more than 6,000,000 pounds of the British imports were credited to France.

The specialization of the North African growers on one export variety, and that a late ripening one, is to the advantage of California growers, for the latter by producing dates of early maturity can get their product on the Eastern market before the first of the neat and inexpensive French cartons can reach New York.

The next great date growing country is Egypt which, however, does not produce enough for its own needs. While it exports some dates, mostly of the large soft variety Amri, it imports a still larger quantity. It sent 2,100,000 pounds to Great Britain in 1919, according to the records of the American consulate. Apparently, however, it need not be feared as a rival in American markets in the near future.

While Arabia as a whole produces many dates, and choice ones, they are consumed at home. The only great exporting country is the region around the Persian Gulf. The headquarters of the trade here are at Basrah where many choice varieties are to be found. The best of these, such as Khadrawi, Awaydi and Barhi, do not play a large part in the export trade. The export to America is largely made up of the variety Halawi, which is a good one; while India, Egypt, and other Oriental countries get such inferior varieties as Sayir.

According to figures furnished by W. A. Taylor, chief of the federal bureau of plant industry, the opening wholesale quotations on bulk Halawis in New York during recent years have been from 10 to 18 cents per pound. It is thus evident that a packed carton of Deglet Nurs costs no more at retail in London than does a pound of wholesale Halawis badly packed in bulk, in New York.

The Persian Gulf is almost directly opposite California, straight through the globe. The growers of that region therefore have to ship their dates nearly half way around the world in order to reach the American market. This long water haul, while not expensive, is time consuming, and is one of the factors which makes it difficult for the Persian Gulf dates to compete with any except the latest ripening varieties in California. Early ripening varieties here, such as Khadhrawi, Tazizaut, Ghars, Khustawi, and the Halawi itself, can be put on the American market a month before the first dates from the Persian Gulf reach New York. The later ripening varieties grown in California, of which Thuri, Deglet Nur and Saidi are the best known, will have to face the direct competition of the dates from Basrah.

Hitherto these dates have been handled in such an unskillful way that they have not really been competitors of any of the good California dates. It has been sometimes imagined that the English who now control Mesopotamia would revolutionize date growing there and become real competitors of California growers in the American market. So far there is apparently no indication of such a change. One of my correspondents in the Persian Gulf, writing on August 26, 1920, says:

"The fears about the British are totally unfounded, according to my idea. I did not see any signs of increase in the date line. Indian workmen are strictly forbidden to come to Mesopotamia. The local workmen have been employed to a great extent by work for the army and in civic improvements, so whence will there be any labor to lay out and develop the supposed new gardens? But the presence of the army here has doubtless developed a taste for dates in England so that the demands from there for dates will be greater than before." To this it may be added that in 1919 Great Britain, with less than half our population, received more than twice as many dates from the Persian Gulf as did the United States.

From this brief review of the foreign situation certain conclusions seem to me to be indicated.

Other things being equal early maturing dates will be less subject to foreign competition than will those which mature late in the season.

Those varieties which are most profitable commercially, in such respects as ease of handling, heavy yield, regularity of crop, as well as good quality, should be preferred by California growers.

Effective steps must be taken to reduce the cost of handling the California product. This means a thorough study of the situation by every grower. It will probably require many small changes, but the principal economies will perhaps be effected in production of a smaller percentage of culls, better utilization of culls, and in cooperative packing and marketing.

No one can predict future developments with certainty, but my own belief is that Californians can outdistance their competitors by putting out better dates, and that if they follow out such precautions as those men tioned above they need have little fear of foreign competition.

DEPARTMENT ANNUAL REPORT

The annual report of the California state department of agriculture for the year ended June 30 is made a part of the monthly bulletin of the department, being in Numbers 10 and 11, Volume 9. It contains illustrations of the buildings occupied by the department, and of various insects, some beneficial and some of our more common pests; likewise illustrations of dairy appliances and a fund of information as to the work of this large department. We believe this number of the bulletin will be sent to everyone writing the department at Sacramento and requesting it.

ARSENICAL SPRAY ON PEARS

Extensive investigation of arsenical spray residue as it affects the marketing of pears is planned by the federal bureau of entomology in cooperation with the pest control service of the state department of agriculture. A. J. Ackerman has been assigned to this work by Dr. A. L. Quaintance of the bureau and is now on his way to California. On his arrival a meeting of pear men will be held in Sacramento and plans for the work laid before them. Headquarters for the project will be at Sacramento.

FRUIT GROWERS' CONFERENCE CALLED

The fruit growers of America have requested the American Farm Bureau Federation to call a conference of their representatives to discuss ways and means of advancing their interests. President J. R. Howard has issued a call for such a meeting to be held in the Congress hotel, Chicago, on April 5. The department of cooperative marketing will have the meeting in charge. Each state farm bureau federation has been requested to send at least one official representative of the fruit growers of its state.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

An avocado orchard does not have the wonderful attractiveness which the orange has in that there is no such striking contrast in coloring of leaf and fruit. The fruit of many of the varieties, even when fully ripe, is as green as the leaves. A few show wonderfully rich purple, and the large dark leaf adds to the beauty, but the fruit has an attraction for many which the orange does not, and the taste once formed insists on more, and enthusiastic members of the avocado club maintain that it is going to be one of our most important products. Only a few hundred acres have been planted, mostly south of Tehachapi. This season will see this acreage greatly extended.

* * *

Another subtropical fruit touched upon in this issue is the date. This industry may be said to be established in the Coachella Valley, but excepting in that little section America is not growing dates in a really commercial way. The Imperial Valley has a small planting, as has the Yuma Valley in southwestern Arizona; also Arizona's Salt River Valley. The time is yet to come when we will make carload shipments.

Now does the winter of our discontent give promise of a glorious summer because of the shower early this week.

* * *

Last Monday was Invitation Day. As a Valentine we were all expected to write and ask our Eastern friends to come to California. California has wonderful highways and many other advantages. It has more wonderful scenery and most wonderful climate, and we wish all the world could come and experience it, but there are some things which need correction before all the world gets here if the visitors are to be pleased and like us well enough to remain. To one of these only we will refer. It is the "free ride" offered by real estate promoters in the monster rubberneck wagons. "Free ride to the harbor"—with the ticket shoved into one's face—one hears again and again as he passes along the principal streets of one of California's loveliest cities. Acceptance of the invitation soon brings the assurance that having accepted the free ride and the free lunch and free information the accepter is expected, and most urgently, to come across with his signature to a contract to pay, say, $1200 or $1300 for a "business" lot on mud flats perhaps miles from any real business location. Some of these lots are declared to have no commercial value whatever and those who really wish for the best interests of California should start a movement to stop this practice.

* * *

The ninth congressional district held a special election last Tuesday, made necessary by the death of Congressman-elect Van de Water in an accident. Walter F. Lineberger of Long Beach, a thorough protectionist, was elected.

* * *

Freight rates, at least on fruits and vegetables, must come down—or the grower will. Charles C. Teague says: "It is becoming more apparent each day that the advances of, first, 25 per cent, and then 33 1/3 per cent in the freight rates have put a burden on the heavy tonnage producing fresh fruit and vegetable business of the Pacific Coast that is more than the traffic can bear."

THE AGRICULTURAL COLLEGE

This seems to be a critical time in the history of our state agricultural college. The board of regents of the state university is investigating as to its needs and has a committee report before it. State legislators we believe are generally willing to do what is best for the state agricultural college, so they are asking "What is best?" The committee consisting of members of the faculty, which is appointed by the board of regents has reported in effect recommending the continuance of the college of agriculture headquarters at Berkeley, but in order to give opportunity for its proper activities that there shall be purchased 200 acres of land at a cost of $750,000—other sums to be appropriated to construct buildings—and that this near-Berkeley institution shall be equipped and used as general headquarters for the college and for instruction and investigational work for the junior and senior years of college work; then in connection with this, or rather a part of this plant, the "northern branch" at which the freshmen and sophomore instruction is given shall be located at Berkeley.

We do not know as to whether the committee recommends any other branches, but it is implied at least that either a southern or a central college branch for the first two years' work may ultimately be installed. There is, however, serious objection raised on the part of some that this division means lessened power, and these are urging one great central college which shall be located on farming land of sufficient acreage to make it a truly working institution. So far as we have heard suggestions the hope of those who believe in this centralized college is that it shall take the place of the university farm school now maintained at Davis.

Again, it is urged that Davis is some 700 miles from one of the state's largest agricultural sections, and the question is asked: "Why place it so far to the north and why dismantle the farm school which has proven invaluable in California practical farming operations?" The state university now owns a tract of valuable agricultural land consisting of something over 5,000 acres in Fresno, almost in the exact center of the state. There are north of Fresno County, according to the census recently completed, 58,108 farms. Including Fresno County, and from there to the southern boundary there are 58,054 farms. But of the farms north of Fresno there are many in Madera, Merced and Stanislaus which would find access to an institution in Fresno much easier than to one located farther north.

The Cultivator has no suggestions to offer, other than that if one great centralized institution is deemed wiser than smaller ones nearer to those who would seek educational advantages, why not centralize as to geographical location?

These are times when taxes are mounting beyond possibility of bearing the burden. Therefore, rather than pile the burden still higher, is it not wise to use equipment already in hand, or at least refrain from investing nearly another million in more land far from the center of the state?

LOBBY—PAYING TAXES

There was a showing of fine liberality on the part of voters of California when at the last election they voted increase of taxes which they were willing to pay during the next two years of nearly $18,000,000. That $18,000,000, plus the amounts required for regular state administration and heretofore appropriated by the state legislatures each two years, will amount to such a tidy sum that one big problem was passed up to the legislators. To meet it the "King Excess Tax bill" was prepared, sent to the committee, returned to the assembly, then failed of passage. Now the state, and especially the legislators thereof, are asking, "How will we do it?"

There are two ways possible. The first is by increasing the tax on corporations and the other is by levying an ad valorem tax on farming lands, livestock, poultry, personal property, and real estate of California. The corporations have announced that if this tax, which they term an unjust one, is put upon the corporations, the only possible recourse will be for them to appeal to the state railway commission for an increase in rates in order that the increase in taxes may be met in other words, the capital invested in public utilities of the state cannot be called upon to pay this additional tax which the people voted upon themselves.

The farmers of California have lost literally hundreds of millions of dollars during the past year. This loss is not imaginary, that is, it is not a loss over the price expected so much as it is a loss over actual cost of production, and the farmers are in no position to take this great increase in taxation upon their own shoulders. The state federation of farm bureaus declared itself to this effect most emphatically at a meeting held only last Monday.

It seems to be a fairly well established fact, at least so considered by many, that capital cannot and will not be made to pay taxes. As one has expressed it, "If it is, it becomes impaired and ultimately ceases to be." We are going to relate a circumstance of many years ago in a town of, say, 8,000 people. A bank with a capitalization of $100,000, considered the largest and most influential institution in the town, was found to be paying taxes on an assessed valuation of $150 for furniture, fixtures, etc. The state tax was at that time on an ad valorem basis and, as we recall, it, with county and municipal taxes, totaled about three per cent. Thus the total sum turned in to municipal, county and state treasury by this large institution was four dollars and fifty cents.

We hasten to say that we realize banks are today on a different basis and are bearing a more just proportion of the support of the government which protects them, and this incident is told only to illustrate the burden formerly carried by farmer and banker, and the prejudice which it is now hard for us to shake off.

Now, assume that this $100,000 had been invested in small farms, say 20 of them, which would mean an average investment in each little farm of $5,000, the assessor would have placed a valuation on these farms and the improvements thereon at "full cash value." Each cow, each horse, each cultivator, each plow, even to the last dozen hens, in fact, a complete invoice of the possessions of the farmer would have to be placed in the hands of the assessor. This might aggregate, say, a total assessed valuation for each farm of around $3,000, which at three per cent would call for $90 from each of the 20 farms, or $1,800 from all. But here the accountant and the banker remind us that the $100,000 invested in banking has become a liability and not an asset, while the farms purchased with the other $100,000 have become a taxable asset.

All of which, it seems, was entirely true, according to former day methods. Under the present corporation taxation plan this capital, together with undivided profits and reserve, is reached, but we believe not to the extent that the farmer's assets, which must be explicitly itemized, are reached.

In touching upon this question in the issue of January 29 under the title of "Who Pays Taxes?" we wish to correct one statement or, rather, to make plainer our meaning. We referred to the "lobby" in a way which might imply that a lobby is a dishonorable institution, and one of the Cultivator's best friends writes to ask if a lobby is without honor, and if so, how can we justify the committees of lemon, walnut and other California growers who recently went to Washington to make explanation before the house and senate committees of the condition in which California fruit growers will be placed if there is no protective tariff given to them.

A most pertinent question. And we hasten to say that the word lobby,

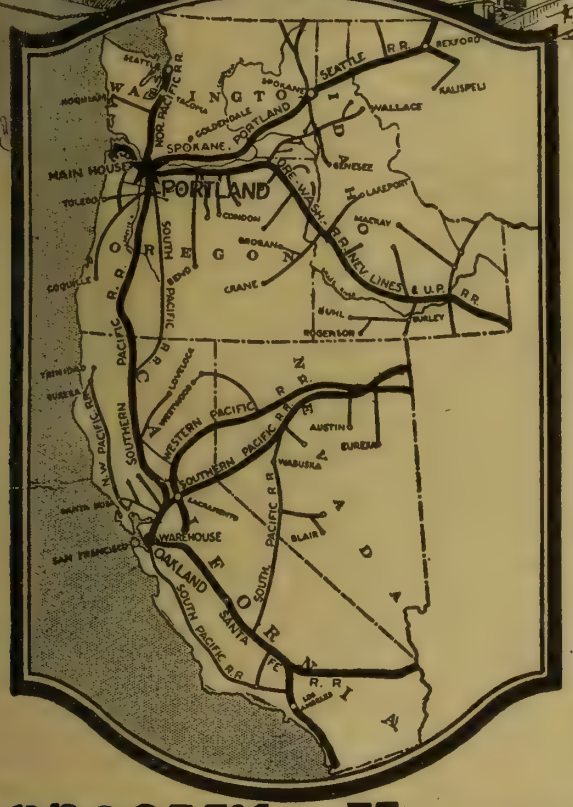
When in **Portland** Visit Us at 27th & Vaughn Streets



New Complete Pacific Coast House of Montgomery Ward & Co. Now at your Service

HERE is great news for the people of the Pacific Coast! In the past Montgomery Ward & Co., has carried only a limited line of goods at Portland. Your confidence in The Original Mail Order House, expressed in thousands of orders, has caused us to build at Portland a Main House—we have just opened our new, complete Portland store, the largest building on the Pacific Coast! The new Portland store means greater service, quicker delivery and even more worthwhile savings on almost everything for your home, workshop or farm.

2200 Miles Nearer You Save

in Sending Your Orders Here

THE new Portland Montgomery Ward store means shorter hauls, a big saving, and quicker delivery of parcel post, express, and freight shipments. Freight shipments from Portland reach any part of Oregon or Washington in from one to three days. Idaho shipments are completed in from two to six days; California, three to seven days; and Nevada, seven to ten days. Parcel post and express shipments from Portland reach any part of Oregon or Washington in one to two days. Idaho shipments take two to three days; California, two to four days; and Nevada, three to five days.

Our Oakland Warehouse

Most heavy merchandise will be shipped by freight to points in California and Nevada from our warehouse in Oakland. This warehouse means a great saving in freight and express.

WE have brought this great mail order house 2,200 miles closer to you. Portland is the center of five great trunk lines, numerous electric lines, and is a shipping point for ocean transportation! This will mean that you will have high quality goods in quicker time and at lower cost than ever!

The eight-story Portland building contains 12½ acres of floor space. Its receiving platform can accommodate 18 freight cars a day. A branch post office sees that mail orders are properly dispatched. A thousand trained employes will help us live up to our primary business standard—"a square deal for the customer."

Do YOU Know—

THAT Montgomery Ward & Co.'s new Portland house is the largest concrete structure of its kind on the Pacific Coast?

That 25,000 cubic yards of concrete have been used in its construction?

That the giant store is eight stories high, in addition to the basement, and contains twelve and a half acres of floor space?

That 18 carloads of merchandise can be shipped from the Portland plant in a single day? That a branch United States post office in the big store takes care of all orders sent by mail? That the new plant is located on a ten-acre tract?

We want you to visit us when in Portland

Goods Handled at Portland

Mottle Leaf

By R. R. Snowden

REFERRING to "The Effects of Nitrate of Soda on Soils," as reported in "Report of the College of Agriculture and the Agricultural Experiment Station of the University of California," July 1, 1918, to June 30, 1919, I beg to submit the following criticisms:

A Widespread Cause of Mottle Leaf

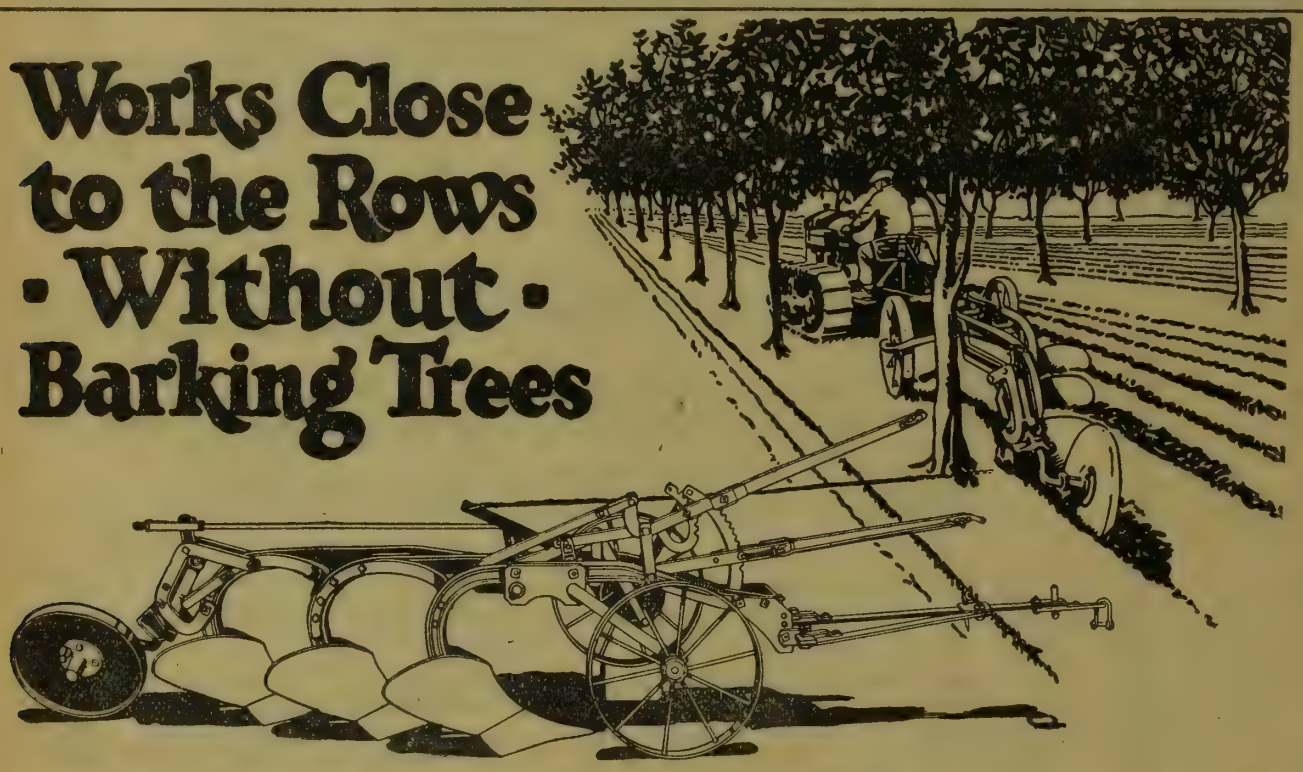
Sodium nitrate and soluble calcium salts obey the same law of transference in the soil. Both are carried down by rains below the zone of root action or both may rise with the soil moisture. If the sodium is concentrated in the root zone the soluble calcium salts are also present in the root zone. If the soluble calcium salts are carried down below the reach of the root action, then the sodium salts are carried at the same time below the reach of the roots. They move together.

It is a fact that with difficulty water penetrates a deflocculated soil and aeration is also retarded. As a matter of fact deflocculation surely will follow the more or less complete removal of calcium from the soil. If nitrate of soda renders the unavailable calcium available for plant growth while the sodium is fixed in insoluble combination, that certainly is to be desired. This action, however, should be limited to the current needs of growth and fruit production. When the calcium supply becomes inadequate the proper thing to do is to add more calcium and to keep up the supply by its further addition to the soil, and not to discontinue the use of any needed soil material. If excessive amounts of nitrate of soda are added it is a waste of a valuable fertilizer material and is not to be recommended. It is foolish to abuse any good thing by its excessive use. Why do this with nitrate of soda any more than with anything else? Nitrate of soda enables plants and fruit trees to use all the other plant foods in greater quantity and herein lies its power to increase growth and fruit production, but like a bank account, a soil element is depleted by its legitimate and necessary withdrawals. What else could be expected if the deposits made are not currently equal to the withdrawals?

Mottle leaf following the extreme abuse of nitrate of soda is due to more rapid use of the other plant foods, with equivalent returns in the crop, and consequently the quicker exhaustion of the one in most limited supply, called the limiting factor. When lime is the limiting factor the citrus trees under the healthy functioning encouraged by nitrate of soda soon exhaust it and the physical condition of the soil suffers unless the supply is renewed from time to time on account of lack of lime and not on account of further additions of nitrate of soda. This has been proved beyond question many times. After the calcium has become inadequate the further use of nitrate of soda accentuates the need of this element, since the trees are able to use larger amounts of all the other necessary elements. Then, since no new plant cells can be formed without calcium, the trees unavoidably show evidences of distress. But under such conditions more calcium with organic matter to correct the deflocculation of the soil will invariably bring the trees to their normal condition.

A scientist of the California experiment station staff finds the "analyses of different portions of citrus trees show that under the influence of the conditions that produce mottle leaf the tree does not secure its normal calcium supply. It appears to absorb excessive amounts of potassium instead." This observation is the direct solution of the difficulty. The trees are mottled because they are obliged to substitute potassium for calcium, which is abnormal. Why, then, blame nitrate of soda when its use may be restricted to the proper quantity to make normal growth and production possible?

Works Close to the Rows · Without · Barking Trees



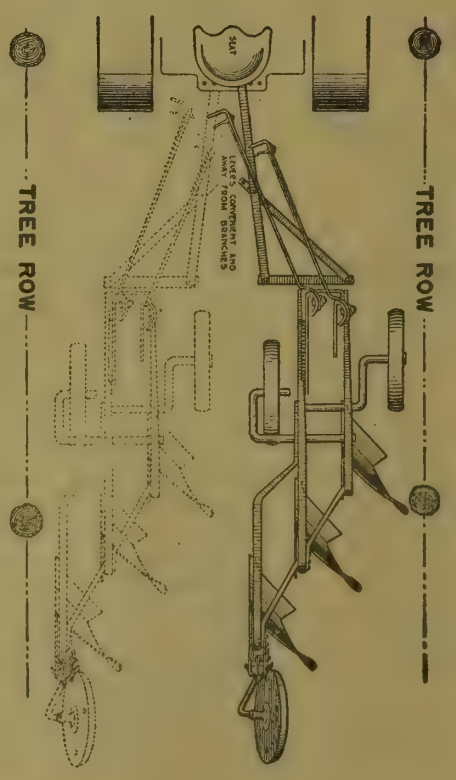
SPECIAL hitch and lever construction gives the John Deere No. 8 Orchard Tractor Plow the important advantage that every fruit grower desires.

Reversible hitch permits setting plow to either side for close work, throwing either to or from row. (See illustration at the right.)

Low-set levers can be angled in when plow is set to either side—they are always within easy reach from the tractor, out of the way of branches, and free of the tractor wheels, when turning short.

Doesn't Scar Trees—Note the wheel base design that permits close work without scarring trees — land wheel set inside line of third beam; furrow wheel set inside line of inner mold-board wing.

You are sure to like the ease with which the No. 8 can be operated for good work in orchards. It gives good results, also, in general field plowing.



Just the size for small tractors—three ten-inch bottoms —pulls light. Can be reduced to two bottoms by removing one beam, bottom and brace, and using a short connecting rod furnished as an extra.

Tell your John Deere dealer to show you this plow. Remember, John Deere implements and repairs for Western territories are kept in stock by John Deere branch houses at San Francisco, California, Portland, Oregon, Seattle and Spokane, Washington, and Boise, Idaho. These branch houses and John Deere dealers in every farming community insure quick and satisfactory service.

Get This Free Book —"Better Farm implements"—114 pages. Illustrates and describes full line of John Deere implements and machinery. Has valuable information on operation of implements. Address John Deere, Moline, Ill. Ask for package O-56.

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

STATE QUARANTINE SERVICE

By Robert R. McLean

COMPARATIVELY few people other than those directly interested quite realize the value of the service rendered by the quarantine division of the state department of agriculture or know what the work of the quarantine officers means to the agricultural and horticultural interests of the state.

Because of our proximity to Mexico and the Hawaiian Islands we have been threatened time and again with the introduction of the destructive fruit flies. Many times these insects in the larval or pupal form have been intercepted in shipments of fruit, in ship's stores or in fruit found in the baggage of passengers, notwithstanding the strict state and federal quarantines against all host fruits, plants and vegetables.

None the less menacing is the danger to our agricultural interests from within the borders of our own country. In Florida and other sections of the South citrus white flies are a costly burden. Melanose of citrus and citrus canker are also present in the South, many millions of dollars' loss being caused by these diseases there. Citrus canker, in particular, only recently threatened the grapefruit industry of Florida with extinction and it is still a serious menace, causing the expenditure of large sums in the effort to eradicate it. As yet the cotton boll weevil and pink boll worm of cotton, the former common in much of the South and in Mexico, have been kept from California, as has also the sweet potato weevil that destroys a large portion of the sweet potato crop in sections of Florida. The alfalfa weevil, occurring in Idaho, Utah, Wyoming and now also becom- Nevada and Oregon, causes the total loss of at least the first two cuttings of alfalfa in the districts affected and would mean the loss of millions to us annually should it become generally established here. The gypsy and brown tail moths in the Eastern states cause the defoliation and death of many fine shade and forest trees, control work being difficult and expensive.

Three recent importations from foreign countries have but recently secured a firm foothold in some of the Eastern states, the Oriental peach moth, attacking the twigs and fruit of stone fruits as well as some others; the European corn borer, spreading swiftly and attacking and destroying sweet, field and fodder corn as well as a great variety of other plants, and the Japanese beetle that destroys many kinds of farm, orchard and garden products. The last two named insects give promise of becoming unusually important economically and every means must be used to keep them out of California. The potato wart disease, of European origin, has appeared in Pennsylvania and must be guarded against as it is one of the most serious diseases the potato is heir to. The Colorado potato beetle, or "potato bug" of our Eastern experi-

Ask Him!

The Holt factory representative in your locality is a farm power specialist. He is familiar with farm engineering problems, soil conditions, drainage, clearing, plowing, land-leveling, cultivating, harvesting, as well as road building, logging, hauling—any work where power is needed. He is consulted on just such subjects every day—he is backed by a reservoir of information at Holt headquarters.

Don't hesitate to ask him. His advice is sound, frank, and cheerfully given. If you don't know him we will tell you where to get in touch with him.

Plant Winter Rhubarb and BERRIES for PROFIT

We can supply plants—all sorts for large fields. Plant also peaches, plums, prunes, pears, figs, apples, apricots, asparagus, artichokes, etc., for your own table and pleasure. We have a good assortment of fruits of all sorts. Write for price list. J. B. WAGNER, Rhubarb and Berry Specialist, Pasadena, Cal.

The advertisers in the California Cultivator are known to be reliable and we recommend them to our many subscribers.

ence is not found in California, although common all through the states east of the Rocky Mountains.

Among the more serious plant diseases now in the East, but not found in California, are the white pine blister rust, atacking and killing all forms of five leaved pines; peach yellows and rosette, incurable diseases of the peach found in 22 of the Eastern and Southern states; chestnut blight, that fatal disease that has apparently doomed all the fine old chestnuts in the East, and two new diseases that have now appeared in the grain fields of Illinois and Indiana, found heretofore in Europe, Australia, Japan and India, the flag smut of wheat and the take-all disease of wheat, barley, oats, rice and rye.

This partial list of immediate dangers threatening California, agriculturally speaking, ought to convince the most casual of two things, first that California is singularly free from many of the most serious insect and disease pests known, notwithstanding the fact that we are climatically and geographically situated most favorably for their introduction, and the second that it is chiefly the splendid work of the men of the quarantine division, in cooperation of course with the federal quarantine authorities, that stands between us and the almost certain introduction of many of these pests here.

BOILING COMBATS GROWTH OF BACILLUS IN CANNED OLIVES

Boiling as a means of destroying the bacillus botulinus, the microscopic spore bearing organism responsible for botulinism poisoning, is now advised by Professor W. V. Cruess of the University of California. He says:

"It is extremely gratifying to state that canned ripe olives are now being placed on the market with absolute safety to the consumer. Most of the outbreaks of botulism have resulted from eating home canned vegetables that were not properly heated before using. Dr. Ernest C. Dickson of Stanford University recently stated that up to June 30, 1920, out of 41 outbreaks of poisoning due to botulism, 31 came from eating home canned vegetables, six from home canned fruits, and only four from eating commercially canned fruits and vegetables.

"Botulism poisoning is caused by a toxin which is developed by the growth of a microscopic spore bearing organism, bacillus botulinus. This organism grows in the absence of air and finds an air tight can or jar of fruit or vegetables an ideal place for growth. The toxin or poison is quickly destroyed by boiling. By boiling canned fruits and vegetables until all parts are thoroughly heated there is no danger of poisoning, even though the fruits and vegetables have contained the poison. It is therefore advised that canned fruit and vegetables be thoroughly boiled after removing from the cans or jars before they are served or even tasted. Do not test food from an open jar to see if the contents are spoiled. Such practice is dangerous and should be discontinued."

Suggestions by Professor Cruess concerning olives that will help prevent outbreaks of botulism are:

Standing solutions containing more salt than in the past has been customary should be employed for shipping and storing unpickled olives. At least ten pounds of salt per 50 gallon barrel of water and fruit are needed when the fruit is to be shipped long distances.

The pickling process should be as rapid as is compatible with the production of satisfactory pickled fruit. Frequent or continuous aeration of the liquids used in pickling is desirable. Long storage of the pickled fruit in dilute brines is very undesirable and is unnecessary.

A temperature of 240 degrees Fahrenheit for 40 minutes will not materially injure the quality of ripe olives of the Mission, Manzanillo and Sevillano varieties. Therefore if the fruit is of good quality at the time of canning, the use of this time and temperature as now required by the state board of health should not injure the reputation of California ripe olives.

Olives processed commercially at 212 degrees Fahrenheit are not sterile. All samples examined after processing at 240 degrees Fahrenheit for 30 minutes or at 250 degrees Fahrenheit for 15 minutes were sterile.

TEAGUE TREES

Ask the man who has planted them and he will tell you that Teague Trees are unequaled in growth and productiveness.

They are the best that can be produced.

If you intend planting CITRUS TREES it will pay you to come and see our stock and let us figure on your requirements while we still have a good assortment to select from, as the supply of good trees is limited.

Avocados, Feijoas and other Tropical fruit trees in all of the recommended varieties.

Send for our new descriptive price list and tell us what you intend to plant.

NATURE AND FUNCTION OF LIME

IN order to give a better idea than some farmers now have as to lime and its value, we quote from Circular 111 of the experiment station of the California college of agriculture. It is written by Prof. C. B. Lipman and the portion of it touching upon the nature and functions of lime is here reprinted almost entire. This circular is, we believe, now out of print.

By Prof. Lipman

The term "lime," as we may employ it in the agricultural sense, includes the following materials: Burnt lime (oxide of calcium), hydrated or water slaked lime (hydrate of calcium), ground limestone or air slaked lime (carbonate of calcium). Speaking with the correctness of the chemist the term "lime" is applied only to burnt lime (quicklime), or calcium oxide. Just how the three materials discussed agriculturally under the name lime are to be employed and where one is to be preferred to the other, if at all, are questions which are answered below.

Before going into a detailed description of the mission or the function of lime in soils it is well to state clearly the relative values for practice of (1) the burnt, caustic, or quicklime, (2) the hydrated or water slaked lime, and (3) the carbonate or air slaked lime. These lime materials are largely valued for the amount of calcium oxide which they contain. Quicklime is nearly all calcium oxide. Hydrated lime or water slaked lime contains less calcium oxide but may be looked upon in practice as nearly equivalent ton for ton to the quicklime. Air slaked lime (like the ground limestone) or carbonate of lime contains only a little more than half the amount of calcium oxide that the quicklime does and therefore two tons of it should be employed if it is used in place of the caustic form. The relative money values can be determined at any time from the foregoing explanation of relationship between the different lime materials. It must also be remembered in that connection, however, that the cost of handling larger quantities and additional freight rates involved must always be taken into consideration in calculating the actual and relative cost of the different materials. The following is a consideration of the function of lime materials in soils:

1. Lime materials have the power of shrinking clay and making it more pervious to water and air, by making a large number of crumbs from large sticky masses. Therefore, lime makes clays and clay adobe soils looser, prevents their packing, baking and cracking, makes plowing and cultivating easier, and, in general, makes the soil physically a healthier medium for plant growth.

2. Lime materials (as above described) serve as a source of the element calcium to plants. Calcium is one of the ten essential chemical elements in plant growth.

3. Lime materials make "sour" soils "sweet." Speaking correctly, they change an acid soil condition to a slightly alkaline one. Acidity of soils is very detrimental to the growth of many agricultural crops. A slightly alkaline condition is ideal for them.

4. Lime materials are necessary for useful and beneficial bacteria and other microorganisms of the soil. It furnishes these the element calcium, which is as essential to them as to the higher plants. It promotes a slightly alkaline condition which is ideal for their development. By its physical effects lime produces good air and moisture conditions for bacteria as above described.

5. Lime materials promote the normal decay of soil organic matter through their effects on the agencies of decay above described. The normal decay of organic matter in soil prevents accumulation of poisonous materials in soils which are detrimental to plant growth.

6. Lime will not neutralize sodium carbonate or black alkali.

AVOCADO TREE RECORDS

(Continued from Page 235.)

individual tree records simplicity is the keynote of success. In view of the fact that the crops of fruit are the most important consideration from the standpoint of the commercial propagation of the avocado trees, it seems logical that individual tree records with this fruit should deal mainly with the season of production, size, color, quantity, quality and other commercial characteristics of the fruits borne by the individual trees. Certain tree characteristics, such as habit of growth, the type of foliage, hardiness, and perhaps others are interesting and oftentimes important, particularly when they can be correlated with fruit characteristics. However, the grower has usually only a limited time for making tree and fruit records, and the more simple and definite the records can be made the more likely it is that they will be carefully secured and effectively utilized. A simple and practicable record form for keeping individual avocado tree records was presented by the writer in an article entitled "Avocado Performance Records," printed on page 46 of the 1919 and 1920 annual report of the California Avocado Association. This form, a limited supply of which has been printed by the association for distribution to its members, is essentially as follows:

The number of lines required to care for the different picks from the individual trees can be extended as far as may prove to be necessary. It is desirable wherever possible to record all of the picks from a given tree dura season on the same page so that at the end of the picking period each year the complete record will appear on one page. After all of the fruits have been picked from a tree, the total number for the season can be ascertained and the average number for each pick found, together with any other computations or analyses of the data desired. At the end of a four, six or other year period, the total productions of each tree for the entire period can be determined. Such data is valuable when secured under proper conditions. It substitutes definite information for guesswork, ideas or hazy recollections.

In some cases these tree record forms have been printed in regular notebook form so that the data secured at each pick is recorded in its proper place in the book when secured. In other cases this form has been printed on index cards suitable for convenient filing. In still other instances the forms are drawn upon wooden labels, sometimes ordinary pieces of smooth box shook, and these labels attached to the trees until the season's records are complete. In securing tree records each tree should be given a number. An efficient and practical method of numbering the individual trees is to give each tree a number, consisting of the number of the block on the ranch where the trees are located, the number of the row in which the tree occurs, and the number of the tree in the row, always counting from some fixed point as, for example, the irrigation head, a house, or other more or less permanent object. It is desirable to make and keep on file a plat of the orchard showing the position of each tree and its number, which can be referred to at any time. The tree numbers can usually be painted on the tree trunks or on suitable labels which can be attached to the tree in such position that they can be easily seen and read.

All the apparatus that is absolutely necessary for commercial tree record work is a set of scales of such size that they may easily be carried about in the orchard and suitable for weighing single fruits and lots of the fruit of the maximum quantity picked for weighing at any one time, and a note form wherein the tree data can be recorded. If the owner of the orchard finds it impossible to secure these records personally, experience has shown that any careful and conscientious person can do the work satisfactorily providing the set of scales, convenient note forms, and any other equipment found to be necessary is provided by the owner of the trees. In the record form under the heading of notes, the shape of the fruits, their texture and color, the weight of seed or any other items of interest can be set down. Notes as to cultural conditions, climatic influences, habit of flowering, fruit-drop, or any circumstances affecting tree and fruit condition can be included with the individual tree data, but usually can be recorded more effectively for future reference by using one or more of the entire pages for this purpose at the time such general observations are made. If the fruits are marketed the price received for them should be included with the other data.

One point in this connection which is apparently confusing to many growers is that it is equally important to secure individual tree records during unfavorable season or when only light crops are produced as it is to obtain the tree records during seasons of heavy production. In several cases in the writer's knowledge such records might have been of the greatest possible value in that they would have determined the general fruiting habit of trees which produced crops during seasons when most of the comparative trees were barren. Without such records it has been found to be impossible to locate, during subsequent years, those trees which, from some reason or other, possibly inherent ones, bore satisfactory crops when the other trees under the same orchard conditions did not produce fruits, or only small crops. In these cases the opportunity for propagating from the apparently hardy and productive trees has been lost. With tree records each year it seems now probable that important isolations of productive strains might have been effected. The natural tendency is to put off from one year to another tree record work. The only way to begin is to begin. I would like to suggest to those who have not already done so to begin this work this year. These records to be complete and of the most value should begin with the first fruits produced, and it would be desirable from several standpoints to begin the records with the planting of the trees. After a start has been made it will be found that it is not an impossible task, but a very practical matter of interest and value to everyone concerned.

There is a greater demand by propagators than supply of budwood from select superior performance record avocado trees of the best variety. It seems likely that such will be the case for some time to come. In such cases, where the tree owners find themselves fortunate enough to possess superior trees, it is probable that they will receive considerable compensation for their tree record work through the sale of selected buds to nurserymen and others. While this is a minor consideration, to the mind of the writer, in connection with the benefits of such work, it is one that should not be overlooked. The main point is to let us secure definite information as to avocado tree behavior under all possible conditions. These data will enable propagators and planters to proceed to develop the industry intelligently and provide against much serious loss that oftentimes comes about from basing operations in a new industry upon guesswork, opinions, misinformation and a lack of reliable information.

Fairbanks-Morse "Z" Farm Engines

We feel that it is up to us as farm engine manufacturers, to go the limit in attempting to bring prices and conditions back to normal.

The farmers of America today need every possible help so that farm equipment costs will more closely meet the lowered return from products sold.

That the "Z" Engine is an essential factor for bettering farm conditions has been proven. Over 300,000 engines have been bought by farmers from over 6000 reputable dealers.

After full consideration — without regard to costs of engines now completed in warehouses of our 26 branches, we have decided upon this big price reduction. Even present costs of labor and raw materials have been ignored.

There is a "Z" dealer near you who will be glad to prove that the "Z" Engine is supreme as to materials — design — workmanship.

So if you can use one or more engines on your farm to lighten your labor, to help you get more work done, this is the time to buy.

How to Grow Sweet Potatoes

THERE have been many calls for reprinting an article which appeared in the Cultivator some years ago in which Q. A. Lobinger, a successful grower of the San Gabriel Valley, wrote describing his methods of propagating young sweet potato plants and growing in the field.

For growing sweet potato plants select some well sheltered spot that will get the sun most of the day. Often such a spot can be found on the south side of a building. Spade up the soil eight or ten inches deep, making it as fine and mellow as possible, and rake it level. About the first of April select medium sized sweet potatoes and place them upon this bed of soil quite close together, allowing about half an inch space between the tubers. If some of the tubers are quite large cut them in two lengthwise and lay them down with the flat side down. If the bed has been made alongside a building do not make it more than four feet wide, as it will be hard to reach the young sets later on. I have overcome this objection by setting up two boards parallel with the building, allowing the board next the building to be 18 inches or two feet away, so that one can get between it and the building. These boards need be only about eight inches wide, and no matter if the bed is eight or ten feet wide, you can lay a heavy board across the bed upon which to stand when getting your sets.

After your tubers have all been placed cover them with clean fine sand to the depth of about one and one-half to two inches and give them a thorough watering with the sprinkler. Do not water too freely after this first time until the sets begin to show up through the sand, but on the other hand examine the soil every day to see that it does not dry out. After the sets begin to grow the bed can be watered more freely. Some growers plant the sets out in the field as soon as they are large enough, while others go over the bed from time to time and break off the sets from the potato, allowing the potato to remain in the bed, and transplant the sets very close together in rows. They are set a couple of inches apart in the row and the rows can be any width from 12 inches up. If the soil is very sandy and they are freely watered and kept well watered they will throw out a mass of fibrous roots that makes it an easy matter to transplant them into permanent quarters. I think it pays well to pursue this latter method.

They are always set on ridges which can be about two and one-half to three feet apart. These ridges can be made quickly by putting a large single shovel on a one horse cultivator. If you would mark out your ground first, making the lines the distance apart you want the ridges to be, you would find it easy to make them straight by walking the horse on the line, provided, of course, you have made four lines straight. As the tops of the ridges made in this rapid way will be somewhat uneven, it is well to go over them with a rake. Then set your plants along the top of the ridge about every 15 inches. Set them pretty well down in the soil and leave a basin around each plant that will hold from one to two pints of water. Have someone follow the planter and water each plant. Go over the next day or soon as dry enough and level in the soil around the plant. The after care will be to keep the field clean and give water as needed. As to the quantity of seed per acre it will depend upon so many things that it is difficult to name any exact quantity. The skill and experience of the grower counts for much. It will range from 200 to 400 pounds.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Maintenance of Bridges

An unincorporated ditch association several years ago constructed a ditch across which are a number of bridges necessary for the use of the roads, which were reserved in the deeds as public right of ways. Who is required to maintain these bridges? In case of accident, who would be liable for damages?—Subscriber, Hughson.

The laws in respect to the dedication and formation of roads have been from time to time changed so that in any particular occasion it would probably be necessary to look up the exact date and exact manner of the dedication of the road, but, generally speaking, it is provided that in all counties of the state public highways are all such roads, streets, alleys, lanes courts, and places, trails and bridges which have been laid out or erected as such by the public or if laid out or erected by others have been dedicaed or abandoned to the public or made such public highways in actions for the partition of real property. By another section it is provided if the overseer in any road district fails to make needed repairs to a bridge and after being informed that the bridge is impassable or unsafe, is requested to make such repairs by two or more freeholders of the district and he fails so to do, such freeholders may present the facts to the board of supervisors, which, upon being satisfied that the bridge is unsafe, will cause the bridge to be repaired and must pay therefor from the district chargeable therewith or, if necessary, from the general road funds. It is probable, therefore, that in the case cited the county would be liable for damage caused.

Unknown Apple

Could you tell me where to find a Red Hall apple and a Bailey persimmon? I would be very glad to get some of these trees, but find no dealer who has them.—Subscriber, San Gabriel.

A close search of all available lists fails to find a name closer to Red Hall than "Red House" and "Red Horse," which originated in Kentucky and are of local circulation only. The "Nomenclature of Apples from 1804 to 1894," published by the United States department of agriculture, the most complete list issued, does not give Red Hall. We know of no Bailey persimmon and suggest the name may be Gailey, which is listed by some California dealers and is the most valued of all for pollinating other varieties.

A New Grass

I read in the April 17, 1920, Cultivator information about grasses, one especially, Phalaris bulbosa. Could you inform me where I might find out about this grass?—Subscriber, Lemoore.

This grass is now under observation locally for the second year and results are not yet conclusive. It promises well. In the Manning River section of New South Wales, Australia, it is reported: "Phalaris bulbosa has proved the best winter grass that has ever been grown in these parts, producing excellent succulent feed right throughout the cold months of the year." The "Agricultural Gazette" of New South Wales, issue of November 2, 1920, gives the following description of this grass: "Phalaris bulbosa (Toowoomba Canary Grass), an introduced perennial, which has had continuous trial at this farm, under both plot and field conditions. It withstands frost very well, and even during severe winter weather it makes fair headway. Its growth during a dry spell is very marked in comparison with other grasses. In a normal season it grows three to four feet in height, being at its best toward the end of the summer. Patches under the best of conditions on this farm have reached a height of seven feet without becoming harsh or woody, the leaves reaching to more than half this height.

Crane Flies

I am inclosing a worm that is getting to be a pest in this neighborhood. At places they are quite plentiful and wherever they are the ground is almost grassless. They are getting into a barley field and starting to clean it. —Subscriber, Cordelia.

This is the larva of the ordinary crane fly, reports of damage from which are coming from all portions of the state. The destruction is largely in the stage of the life of the insect in which it is shown in the box of soil sent with the "worms." They prefer a wet soil and almost completely destroy plants, being especially destructive to alfalfa and the grasses. After a few weeks of this destructive work in the soil they escape in the form of extremely long-legged "flies," though the female is wingless. There is no method of control for the pests in the soil. Plowing and thorough cultivation does, however, destroy millions of them, especially if soil is thrown up so as to dry out, and the pest is destroyed.

Tulips Don't Grow

I am sending bulb of a tulip which started to grow and then rotted. Last year the same thing happened, not to one but a dozen, and none bloomed. I changed the soil for this year's planting using plenty of leaf mold and prepared fertilizer. Can you tell me what the trouble is?—Subscriber, Crockett.

We are unable to determine any disease affecting this bulb. It does look as if it had been started during a period of dormancy and later dried off. If those which are living at the end of this season's growth are lifted soon after blooming and thoroughly dried off during the summer and planted in late fall it is possible they may escape the trouble another year.

Sheep in Orange Grove

I have five acres in oranges. Would it pay to keep 20 or 25 sheep? I figure to keep them corralled on cement floor. Would have to buy feed. Would the returns on fertilizer, wool and meat pay? Are the French Merino sheep the best? Where will I get the best? Will a cement floor be injurious?—Subscriber Anaheim.

Here is a question we will pass on to our subscribers and ask for a few notes from those who have had experience. As a matter of judgment only, and not because of any experience in the matter, we would say that under the conditions mentioned the keeping of sheep would not pay. Notwithstanding that we are thoroughgoing believers in diversifying so far as possible. If an orchard is supplied with water through open head ditches in which weeds are becoming a pest and distributing seeds to the rest of the ranch and the ditch line could be double fenced without too great expense, then if a few sheep would clear the line of weeds and secure a liberal part of their living in doing it we could see wherein fresh meat for the home and the ranch hands could be secured, and with the fertilizer a little profit possibly be made. Unfortunately, an orange orchard offers wastes of no particular value as a cheap sheep feed.

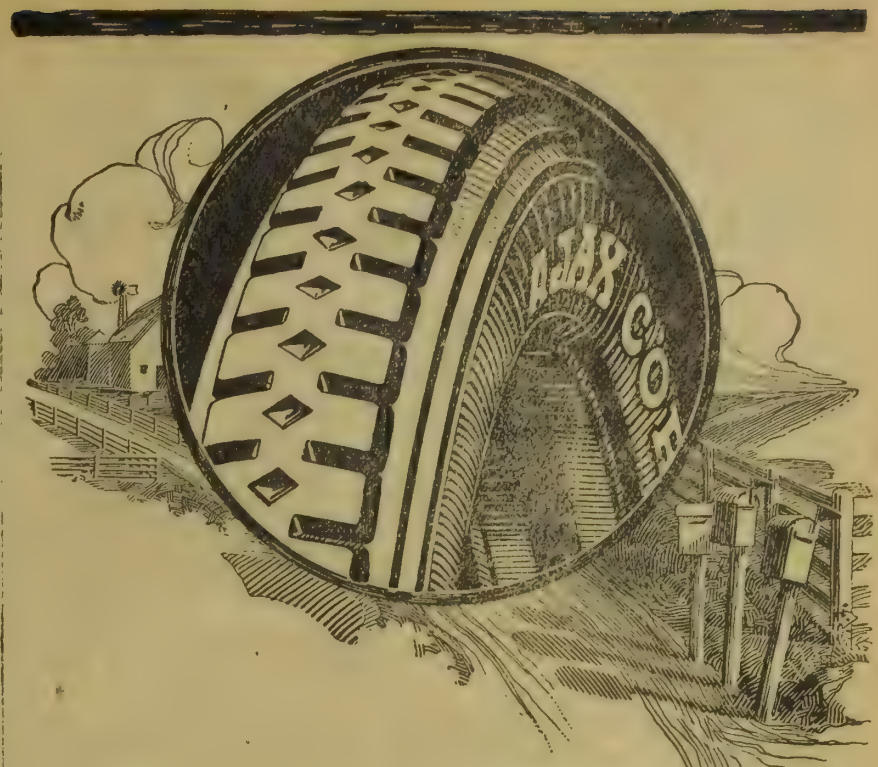
Salt for Rabbits

Will you kindly tell me if salt is necessary in the rabbit's diet?—Subscriber, Lucia.

Yes. All animals need some salt. When wild they obtain this naturally from salty water or salt licks. Many keep a small piece of rock salt, the size of a large walnut, in their barley dish all the time; others take a salt brick such as is used for cattle and with a saw cut them in two inch cubes and by string or wire attach to side of cage; others use small spools of salt made for this purpose. The writer has used them all and would say let them have salt to use just as we do, naturally.—W. D. W.

Rebudding Citrus Trees

We bought place set to Valencia oranges, Eureka lemons and grapefruit. The trees are two years old. A lot of them are seedlings. Could we bud Navels, grapefruit and tangerines on those trees? Could you tell me what



THE real way to judge tire value is by the mileage profit the tire pays. On this basis alone, the Ajax Cord has earned its splendid reputation—and on this same basis this fine reputation will always be upheld.

Note that cleated tread—it holds on dirt or paved roads.

Your Ajax dealer will take pains to sell you an Ajax Cord which will meet *your* road requirements to a "t."

Buy the tire he recommends.

trees can be budded to them? I have a seedling avocado. Could I bud it over? Could I bud a kumquat on the citrus trees?—Subscriber, Bell.

Presume these trees could be readily budded or worked over. Probably any citrus varieties could be budded on them. If they are seedlings the inquirer would probably be able to tell by examination. The form of the leaf and the presence of long, savage looking thorns are marks of the seedling. If they are not the "sour" root but are the Tahiti or the sweet strain then we would not use, but would suggest replanting. In fact, so long as the trees are only two years old and the owner probably has little experience in rebudding, we would question any effort to save the trees. The budding of a seedling avocado is performed in practically the same manner as the budding of the citrus tree. There is, however, greater difference in the buds; it is very difficult to get some of the varieties to "stick."

GROWERS ENDORSE RAISIN ASSOCIATION

Resolutions adopted at the big mass meeting of raisin growers held in Fresno, February 7:

Whereas, the unparalleled prosperity which has been enjoyed by the raisin growing territory of the state of California ever since the organization of the Californa Associated Raisin Company in the year 1912 has been due wholly to the operations of said company as an association of growers; and

Whereas, the success achieved by the company in handling and marketing the constantly increasing tonnage of raisins produced in California, so as to yield a profit in each year to all of the growers under contract to it, has been due in large part to the prudent and careful management of the affairs of said company by its president, Wylie M. Giffen, and its board of directors chosen by the trustees for the stockholders; and

Whereas, the efforts of said officers in the interest of the raisin growers of the state have been untiring and unselfish to a degree seldom secured at any price by any business enterprise;

Now, therefore, be it resolved, by this mass meeting assembled at Fresno, February 7, 1921, that we hereby ratify and endorse the acts of the president and officers of said company and of its boards of directors and trustees, and express to all of said officers the appreciation of all classes of citizens sharing in the prosperity of the raisin growing sections of our state, for their unremitting efforts to place the business of growing raisins uopn a stable and prosperous basis; and

Resolved, further, that we express our entire confidence that the policies of the company will be continued in force, and we earnestly urge upon all growers of raisins in the state of California to support their organization and insure its continuance and the continuance of the prosperity of our state by signing the crop contracts to be presented to them by the company.

SUPERIOR INTELLIGENCE

"Why don't you teach that dog to do some tricks?"

"I have tried," replied the man who lacks energy. "The dog won't learn."

"Not enough intelligence?"

"Too much. I can see by the expression on his face that dog doesn't see any more sense in the tricks than I do."

HEARD AT THE LANDING

Hopeful Immigrant—They told me that in America it simply rained money.

Hardened Yank—Well, if you remain here you'll get soaked like the rest of us.—Boston Transcript.

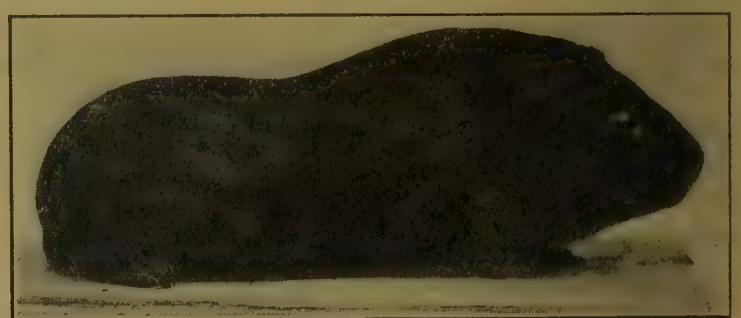
Splint or Spavin

Some time ago I purchased a team of mares supposed to be sound. Shortly after having them I discovered that one mare always limped in the front left leg whenever trotting on the road. When working on soft ground we do not notice it. She does not handle the leg freely when backing and seems to be sensitive and lifts up the hoof when one touches the leg. We had the blacksmith trim the hoof and examine it for corns but he claimed there were none. Can you give me an idea what is wrong and what to do for it? —Subscriber, San Fernando.

From the symptoms you give one might suspect it was due to a corn, but since the blacksmith did not find one it may be a splint or ringbone. The mare has probably been taught to lift the foot when touched on the leg, which makes her appear sensitive. A splint is a small bony growth on the inside of the leg just below the knee. A splint is not serious and soon disappears after applying a few blisters. A ringbone is a bony growth in the joint just above the hoof and is quite serious, as it causes lameness for a long time. The result of a ringbone is for the joint to become solid and the lameness does not cease until the inflammation is all gone. This also may be cured by blistering. A good blistering ointment may be made of half an ounce of cantharides, half an ounce of the biniodide of mercury and four ounces of lard. Warm the lard and mix in the other ingredients, stirring the mixture until cool. To apply a blister clip off the hair and brush the parts clean. Rub in the blister with the fingers and warm it slightly with a hot iron held near the parts. Tie the horse so she cannot rub the blister with her nose for 24 hours, then grease it with lard. This should be repeated about every two weeks until the lameness disappears. You may still find a corn deeper than the blacksmith cut and a blister above that will help. Examine the mare carefully and when you have decided what is causing the lameness, if you are not satisfied with this that we have suggested, write us again and we may be able to do better when we know more about it.



Pigs Is Pigs

Ellis Parker Butler is not the only one who has been able to turn the reproductive capacity of guinea pigs into gold. The story, "Pigs Is Pigs," while overdrawn for the sake of humor, conveys a fund of information regarding these little animals. Mr. Roberts, who furnishes the above photograph, is also issuing small booklet on guinea pigs and how to raise them.

R. F. GUERIN HERD TO BE DISPERSED

The well known herd of registered Holsteins owned by R. F. Guerin, Visalia, will be dispersed at public auction on Thursday, April 14, on his farm. This herd is one of the longest established in California. About three years ago the females of milking age in the herd were sold at public auction in one of the most successful sales yet held in the state, and at that time the heifers remaining were mostly daughters of Sir Veeman Korndyke Pontiac, whose daughters are making some splendid yearly records in the herds of Burr Farm, Los Angeles, and Earl Graham, Compton. The present herd is composed mostly of these heifers, most of which now have daughters by King Sadie Vale Idyl Segis, who is by King Korndyke Sadie Vale 27th and out of K. P. Idyl Segis, a 35 pound three year old daughter of King of the Pontiacs. California Breeders Sales and Pedigree Company will manage the sale, with Col. Ben A. Rhoades and Col. Geo. W. Bell as auctioneers.

Household Department

THE LAST SIGH OF THE MOOR

The Spaniards gave this name ("The Last Sigh of the Moor") to the eminence from which, after their expulsion, the Moorish king and his followers took their farewell view of Grenada.

Winding along, at break of day,
And armed with helm and spears,
Along the martyr's rocky way,
A king comes, with his peers;
Unto the eye a splendid sight,
Making the air all richly bright.
Seen flashing through the trees;
But, to the heart, a scene of blight
Sadder than death were these.

For brightly fall the morning rays
Upon a conquered king;
The breeze that with his banner plays,
Plays with an abject thing.
Banner and king no more will know
Their rightful place 'mid friend and foe:
Proud clarion, cease thy blast!
Or, changing to the wail of woe,
Breathe dirges for the past.

Along, along, by rock and tower,
That they have failed to keep,
By wood and vale, their fathers' dower,
The exiled warriors sweep:
The chevroned steed, no more elate,
As if he knew his rider's fate,
Steps languidly and slow,
As if he knew Grenada's gate
Now open to the foe!

Along, along, till all is past
That once they called their own,
Till bows the pride of strength at last
And knights, like women, moan!
Pausing upon the green hill side,
That soon their city's towers will hide,
They lean uopn their spears;
And hands that late with blood were dyed
Are now washed white with tears.

Another look, from brimming eyes,
Along the glorious plain;
Elsewhere may spread as lovely skies,
Elsewhere their monarch reign;
But never more in that bright land,
With all his chivalry at hand,
Now dead, or far departed!
And from the hill side moves the band,
The bravest, broken hearted.
—Miss Jewsbury.

A MESSAGE FROM GEORGE WASHINGTON

Born February 22, 1732. First President of the United States, April 30, 1789-1797

The unity of government which constitutes you one people is now dear to you. It is justly so; it is the main pillar in the edifice of your real independence, the support of your tranquility at home, your peace abroad; of your safety; of your very prosperity; of that very liberty which you so highly prize. But as it is easy to foresee that, from different causes and from different quarters, much pains will be taken, many artifices employed, to weaken in your minds the conviction of this truth; as this is the point in your political fortunes against which the batteries of internal and external enemies will be most constantly and actively (though often covertly and insidiously) directed, it is of infinite moment that you should properly estimate the immense value of your National Union to your collective and individual happiness; that you should cherish a cordial, habitual, and immovable attachment to it; accustoming yourselves to think and to speak of it as a Palladium of your political safety and prosperity; watching for its preservation with jealous anxiety; discountenancing whatever may suggest even a suspicion that it can, in any event, be abandoned; and indignantly frowning upon the first dawning of every attempt to alienate any portion of our country from the rest, or to enfeeble the sacred ties which now link together the various parts.

IMPEACHMENT OF WARREN HASTINGS

THE place in which the impeachment of Warren Hastings was conducted was worthy of such a trial. It was the great hall of William Rufus, the hall which had resounded with acclamations at the inauguration of 30 kings; the hall which had witnessed the just sentence of Bacon and the just absolution of Somers; the hall where the eloquence of Stafford had for a moment awed and melted a victorious party inflamed with just resentment; the hall where Charles had confronted the high court of justice with the placid courage which half redeemed his fame.

Neither military nor civl pomp was wanting. The avenues were lined with grenadiers. The streets were kept clear by cavalry. The peers, robed in gold and ermine, were marshaled by heralds. The judges, in their vestments of state, attended to give advice on points of law. The long galleries were crowded by such an audience as has rarely excited the fears or emulation of an orator. There were gathered together from all points of a great, free, enlightened and prosperous realm, grace and female loveliness, wit and learning, the representatives of every science and every art.

There were seated around the queen the fair haired young daughters of the house of Brunswick. There the embassadors of great kings and commonwealths gazed with admiration on a spectacle which no other country in the world could present. There Siddons, in the pride of her majestic beauty, looked with emotion on a scene surpassing all the imitations of the stage. There the historian of the Roman Empire thought of the days when Cicero pleaded the cause of Sicily against Verres; and when, before a senate which had some show of freedom, Tacitus thundered against the oppressor of Africa; and there, too, were seen, side by side, the greatest painter and the greatest scholar of the age, for the spectacle had allured Reynolds from his easel and Parr from his study.

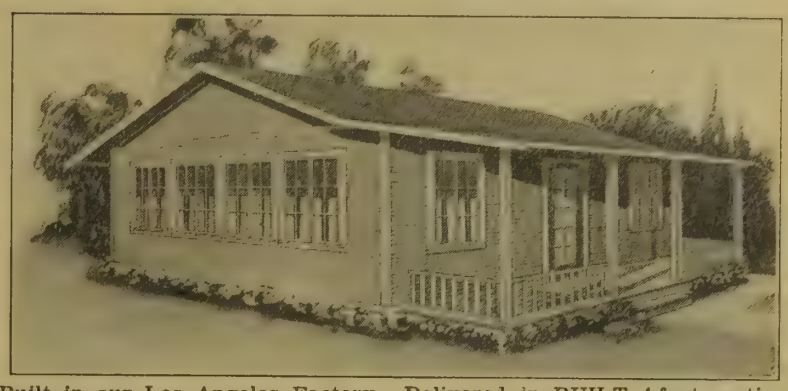
The sergeants made proclamation. Hastings advanced to the bar and bent his knee. The culprit was indeed not unworthy of that great presence. He had ruled an extensive and populous country; had made laws and treaties; had sent forth armies; had set up and pulled down princes, and in his high place he had so borne himself that all had feared him, that most had loved him, and that hatred itself could deny him no title to glory except virtue. A person, small and emaciated, yet deriving dignity from a carriage which, while it indicated deference to the court, indicated also habitual self possession and self respect; a high and intellectual forehead; a brow pensive but not gloomy, a mouth of inflexible decision, a face pale and worn but on which a great and well balanced mind was legibly written—such formed the aspect with which the great proconsul presented himself to his judges.

The charges, and the answers of Hastings, were first read. This ceremony occupied two whole days. On the third day Burke rose. Four sittings of the court were occupied by his opening speech, which was intended to be a general introduction to all the charges. With an exuberance of thought and a splendor of diction which more than satisfied the highly raised expectations of the audience he described the character and institutions of the natives of India, recounted the circumstances in which the Asiatic Empire of Britain had originated, and set forth the constitution of the company and of the English presidencies.

Having thus attempted to communicate to his hearers an idea of Eastern society, as vivid as that which existed in his own mind, he proceeded to arraign the administration of Hastings as systematically conducted in defiance of morality and public law.

REDIMADE

HOUSES and GARAGES



Built in our Los Angeles Factory. Delivered in BUILT 4-foot sections complete with doors, windows, roofing, etc., all ready to assemble and finish in one to five days, depending on size.

Many Plans—One to Five Rooms

We will erect at a nominal charge within 50 miles of factory.

Direct from Forest to You at Lowest Cost

We buy our lumber direct from the mills of the heart of the great Oregon timber country through our main factory at Portland, ship it direct to Los Angeles and by our modern methods and power machinery convert it into attractive permanent houses and garages at a wonderful saving over all other methods. Complete information is free for the asking.

See us first for bungalows, beach cottages, camps, garages, ranch help houses, etc.

Our low prices will surprise you.

Clark & Coberly, Authorized Ford Dealers 2219 W. Pico St., Los Angeles

The energy and pathos of the great orator extorted expressions of unwonted admiration from all, and for a moment seemed to pierce even the resolute heart of the defendant. The ladies in the galleries, unaccustomed to such displays of eloquence, excited by the solemnity of the occasion and perhaps not unwilling to display their taste and sensibility, were in a state of incontrollable emotion. Handkerchiefs were pulled out, smelling bottles were handed round, hysterical sobs and screams were heard, and some were even carried out in fits.

At length the orator concluded. Raising his voice till the old arches of Irish oak resounded: "Therefore," said he, "hath it in all confidence been ordered by the commons of Great Britain that I impeach Warren Hastings of high crimes and misdemeanors. I impeach him in the name of the commons house of parliament, whose trust he has betrayed. I impeach him in the name of the English nation, whose ancient honor he has sullied. I impeach him in the name of the people of India, whose rights he had trodden under foot, and whose country he has turned into a desert. Lastly, in the name of human nature itself, in the name of both sexes, in the name of every age, in the name of every rank, I impeach the common enemy and oppressor of all."—Edinburgh Review.

HOUSEHOLD QUERIES

Removing Stains

My baby's cotton flannel gowns and our counterpanes have whitish ring stains on them which no soap and boiling take out and I suspect them to be either olive oil or milk which latter was inadvertently put in hot suds and set. Is that possible? I have some of the same spots on an Indian head skirt of mine. All stains on her diapers came out easily, but these remain after repeated washings and boilings. Can you suggest anything to remove them? Also can you give me a more efficient rust eradicator recipe than lemon and salt. That doesn't work easily for me.—Subscriber, Burbank.

Boiling water does coagulate the milk and set the stain. Have you used Javelle water on the whitish ring? Javelle water is probably the safest of bleaching and stain removing agents. Many housekeepers no more think of going without it than without soap. It will remove many stubborn stains but should not be used too regularly, of course, and after using rinse fabric quickly and thoroughly. To make Javelle water dissolve one pound washing soda in boiling water in enameled or agate pan (never aluminum). Dissolve half a pound of chloride of lime in two quarts cold water. Let chloride of lime solution settle thoroughly, pour off clear liquid only onto the soda solution, bottle tightly and keep in dark place. To a pailful of water add one or two cups of the Javelle. Plunge clean wet garments into this solution for three or four minutes, then wash out in hot soapy water. Repeat if necessary. This is the strength ordinarily used for bleaching. If this does not remove stain then try working directly on the stain with hydrochloric or oxalic acid, diluted one-half with water, following with undiluted Javelle and washing thoroughly with hot water and soap. The acid and Javelle should be applied directly to stain or wet fabric with medicine dropper or glass rod. For the rust stain, spread stained place over bowl of hot water and apply hydrochloric acid diluted with equal volume of water directly on the stain with medicine dropper till stain turns bright yellow; then immerse at once in hot water and rinse thoroughly. Repeat treatment if necessary. Add a little ammonia or borax to the last rinsing water to neutralize any acid that may remain in the goods.

Ink on Natural Linen

Can any reader of the Cultivator give me a sure method of removing ink from a natural linen table cover without taking the color out, the ink of course having dried in.—Subscriber, Redlands.

If the ink is the ordinary school ink it will be removed in three or four washings and we would not risk using a strong remover until this has been tried. First let ink-stained spot soak in lukewarm water, rubbing gently to start ink and changing water frequently so as not to spread the color to the rest of the fabric. A little mild soap added will help. Then put through ordinary washing process. Soaking in milk for a day or two, changing frequently as milk is discolored, will remove some stains and will not remove linen color. We know of no other treatment that will not take out color, though of course the color of "natural" linen is "faster" than any dye. Washing the entire fabric in Javelle water as suggested in answer above for removing stains will probably take out ink, also bleach slightly the entire cloth.

Commercial ink removers are generally very satisfactory if used according to directions and the whole garment washed immediately. If any of our experienced housekeepers can give help to these inquirers the Cultivator will be glad to publish answers and give subscription credit to the writer.

Washing Rubber Sheeting

Can you tell me how to preserve and wash carefully rubber sheeting in diaper covers, etc.—Subscriber, Burbank.

Wash in lukewarm suds made with mild soap, rinse in lukewarm water, handling lightly, hang to dry in airy place in shade. Where two thicknesses are likely to stick together dust lightly with talcum powder. When laying away, put in cool place, dusting folds with talcum powder.

Grated Potato Pancakes

I have found many recipes in your paper and am wondering if some reader can give me the recipe for grated potato pancakes. My grandmother made them and they were fine, but so far have not found anyone who has even heard of them.—Subscriber, Corning.

Grate about five medium sized potatoes and one onion. Add one egg and mix together, adding about one-third cup of flour, one scant teaspoon baking powder and a little salt. Egg is not always added but makes the pancakes much better.

Sausage Making

Kindly look up for me if there be anything to be had in book form giving recipes and method of making all kinds of sausage.—Subscriber, Marysville.

Farmers Bulletin 913, "Killing Hogs and Curing Pork," is published by the U. S. department of agriculture and may be secured free on request to Division of Publications, U. S. Department of Agriculture, Washington, D. C. This bulletin gives six pages to directions for making sausage; pure pork, smoked or country, Frankfort or Vienna style, Bologna style, blood, headcheese, liver and summer. This in addition to full directions for killing, dressing, smoking, keeping fresh meat, etc., with illustrations of simple smoke houses, etc., make it of great value.

More extended directions are given in "Home Pork Making" by A. W. Fulton, published by Orange Judd Co. of New York and Chicago. This was published in 1905 and may possibly be out of print and it would in any case be necessary to write the publishers for the price. This, the author says, is "A complete guide for the farmer and country butcher in all that pertains to slaughtering, curing, preserving and storing pork products from scalding vat to kitchen table and dining room." One chapter of 11 pages is given to directions for sausage making, special directions for making Bologna sausage, Westphalia, Frankfort, Suabian, Italian, tongue, Black Forest, liver, Royal Cambridge, brain, tomato, case sausage, souse, head cheese, Philadelphia scrapple, jowls and head, cracknels, brawn, blood pudding, spiced pudding, seasonings and bread admixtures. A book devoted entirely to commercial sausage making, with pure food laws, etc., is "Sausages," published in 1918 by B. Heller & Co. of Chicago.

Mildew

Can you tell me how to take mildew out of cloth?—Subscriber, Fowler.

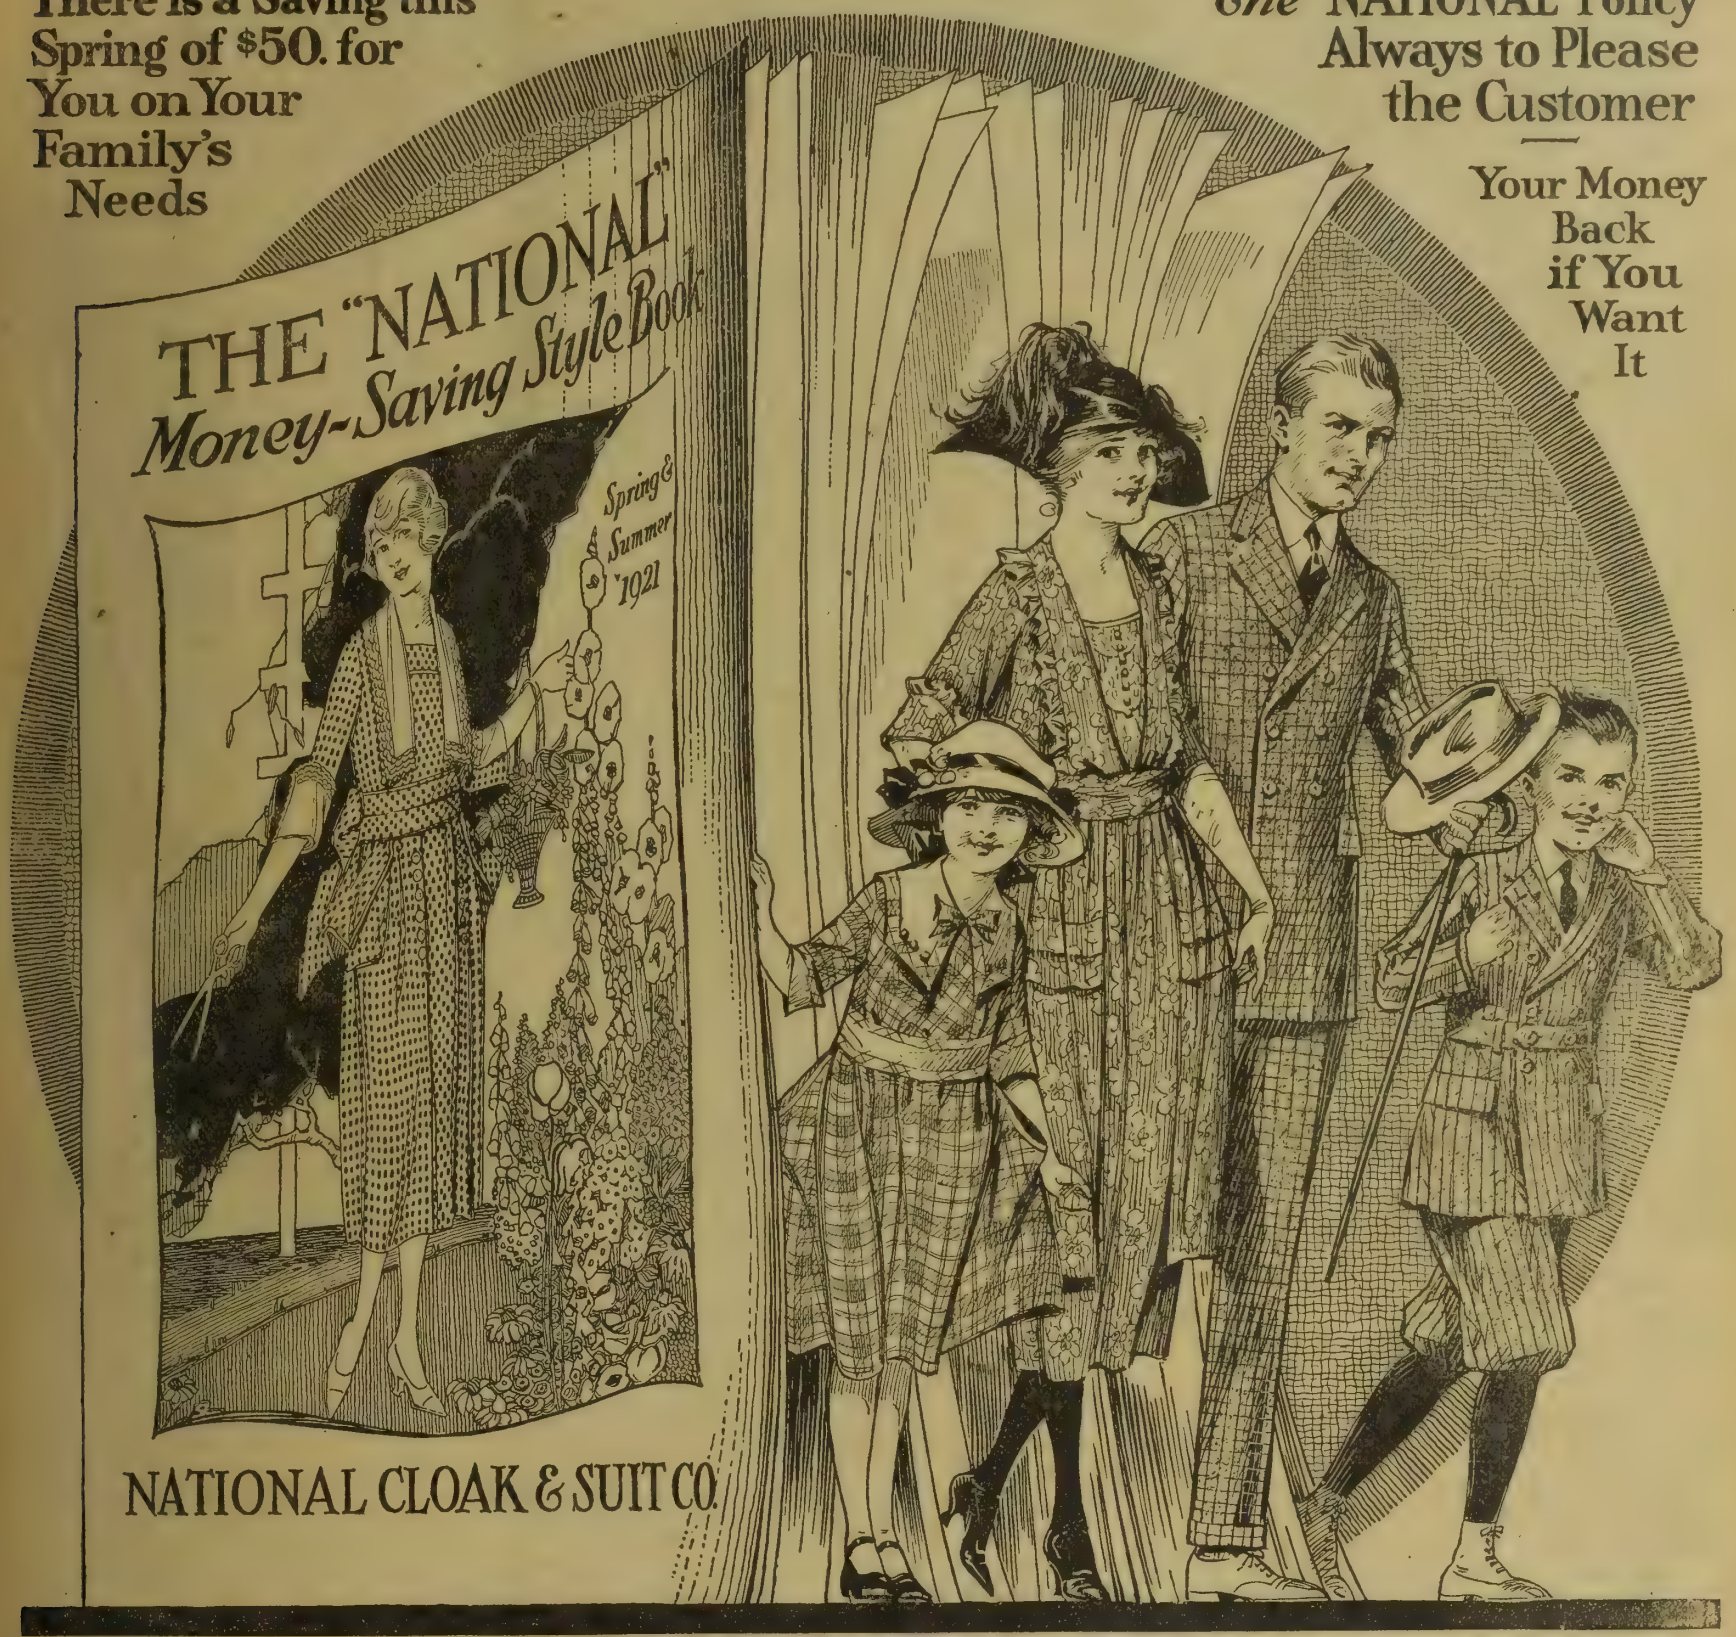
Very fresh mildew stains can be taken out by simply washing in soap

This Style Book is Yours—Free!

There is a Saving this Spring of $50. for You on Your Family's Needs

The "NATIONAL" Policy Always to Please the Customer

Your Money Back if You Want It



OUT of the "NATIONAL" Style Book steps the woman made beautiful by Fashion. From Fifth Avenue Hat, to "NATIONAL" Dress, and Coat or Suit, even to the Shoes, there is the beauty and charm called Style.

And, best of all, that Woman of Style may just as well be you.

Your "NATIONAL" Style Book—and one copy IS YOURS free — shows everything needed to bring to you all that style can give.

For men who believe that appearance is desirable and service essential, there are suits and overcoats and shirts and shoes—**everything** of quality for men.

For young Misses of fashion, there are dresses and coats and hats with the charm of youth. For young men and boys, everything in clothes of quality. For the whole family, everything of the best New York Style. But there is more—far more.

A $50.00 Saving on Your Family's Needs

This very Spring there is a big saving on your family's needs. There is a double saving—for goods of "NATIONAL" Quality are always an economy, and there is a $50.00 saving in price besides.

Our New Kansas City Home

WE have erected a new two-million dollar 12-story home for the "NATIONAL" in Kansas City to serve our customers living in the fifteen States listed below.

This big new building is filled with the same New York styles, the same goods exactly, offered at the same prices exactly, as our New York House.

The only difference is that Kansas City is 1,350 miles nearer to you who live in these States. Your letter travels 1,350 miles less and your order travels 1,350 miles less than it formerly did when you ordered from New York.

So if you live in one of the States listed below, write to our Kansas City house for your copy of the "NATIONAL" Style Book. It is exactly the same as the New York Book, the same goods, the same prices—the same styles and qualities.

If you live in one of these States, write to Kansas City, Missouri.

Nebraska	*Colorado*	*Louisiana*
Kansas	*New Mexico*	*Oklahoma*
Missouri	*Arizona*	*Utah*
Texas	*Arkansas*	*Nevada*
Washington	*Oregon*	*California*

National Cloak & Suit Company
5488 Independence Avenue, Kansas City, Mo.

Here Are the Prices for Spring

All-Silk Taffeta Dresses	*from*	*$11.66 to $25.98*
Last Spring's Prices were	from	$21.98 to $54.50
All-Silk Georgette Waists	*from*	*$2.96 to $9.93*
Last Spring's Prices were	from	$6.95 to $21.50
Waists of the Stylish Cotton Fabrics	*from*	*98¢ to $2.98*
Last Spring's Prices were	from	$1.39 to $3.98
Men's All-Wool Worsted or Cassimere Suits	*from*	*$19.98 to $34.98*

Boys' All-Wool Suits, Sizes 11 to 18 years	*from*	*$7.98 to $13.98*
Last Spring's Prices were	from	$16.50 to $21.50

But your Style Book tells the whole story of lower prices—gives you in detail the saving that may as well be yours.

To write today for your free copy of the "NATIONAL" Money-Saving Style Book, is to give yourself and every member of your family all the pleasure there is in New York Style, in authoritative "NATIONAL" Style, all the delight and satisfaction to be had in apparel of "NATIONAL" Quality, and you secure besides a saving in cash of at least $50.00.

And this page is printed merely to give you this message—that one "NATIONAL" Style Book is held here for you, ready to be sent you free—just for the asking.

National Cloak and Suit Company, 221 West 24th Street, New York City

and water and drying in sun. Light stains can be removed by soaking over night in sour milk and then drying in sun without rinsing, repeating this treatment several times if necessary; or moistening lemon juice and drying in sun will also be effective with light stains. Where stains are dark and old, it is necessary to use stronger methods and care must be taken that fibers of the cloth are not damaged in the process. It is sometimes better to put up with the slight discoloration than to run risk of spoiling the garment. However, if care is taken in use of the following there should be no trouble. First, Javelle water, used as directed in answer to "Removing Stains" in this department. Then as a last resort one might try using potassium permanganate. Remember that this, like the Javelle water, is apt to bleach out colored fabrics, and a little should be tried on a scrap of cloth or underseam first before applying it to prominent place on garment. First rinse garment to be treated. Dissolve 1 teaspoon potassium permanganate crystals in 1 pint water and apply a little of this solution to stain with medicine dropper, glass rod or clean cork, allowing to remain about five minutes. Remove with lemon juice any pink or brown stain left by the permanganate.

Plant Now and Every Week Afterward

For a full yield the year round plant Morse's Seeds in rotation. Follow directions in our catalog—send for it at once.

Handsome Coat Made of Cavy Skins

HINTS FROM HOUSEKEEPERS

For "Subscriber, Lompoc"

Must you have the birthday candles on the cake? Wouldn't you like to use them for a centerpiece and to outline the initials and the number of years, in figures, of the birthday person in a wreath of asparagus fern, and have the cake on a flower trimmed tray on a small separate table? Asparagus ferns and red carnations or poinsettias would be pretty, then you could use red candles and tie the wreath on the table with a smart bow of red ribbon. This would make a good effect.

Use white cake as suggested with a filling of figs and whipped cream, cover with fig frosting and decorate with small colored candies and have candy carnations or poinsettias round the edge. Bits of angelica would give the necessary touch of green for leaves and stems.

In the cake put a bean (which will bring great honor to the finder), a ring (meaning marriage within a year), a penny (for riches), a key (a journey), a four-leaf clover (luck), a thimble (unmarried), a little image or amulet to drive away bad luck. The ones who get nothing are as well off as they were before. All these articles should be wrapped in paraffine paper and placed in little hollows and then iced over, marking the places so the one who cuts the cake will not cut into them. Each guest chooses the piece of cake wanted and makes some wish as the honor guest cuts the slice.

For a surprise arrange some funny tableaux showing the different birthdays of the one for whom you are entertaining. Nothing special would be needed as the more ludicrous this is the more it will be enjoyed. Darken a room and have a big screen for a background. Have some one play appropriate music at the piano. A baby in a cradle would represent the first year. A child starting out to school with books and candy or lunch a few years later; then some game, baseball or tennis; graduation; in business or at work; and finally some one dressed and made up to look as nearly as possible like present date.

For fun: Have different colored tiny candles fastened by their own wax into the halves of walnut shells. Each guest chooses a candle, then they are all lighted in absolute silence and set afloat in a pan of water, which may be stirred by each one in turn to make the fairy boats sail. The one whose boat gets across the "pond" first with the candle still burning is assured of marriage within a year, success in all undertakings and much honor. The boat that sinks or the candle that goes out brings poor success in love or fortune with disloyal friends and many adversities. If two boats touch or drift along side by side with both candles burning it signifies a love affair that will run smoothly. If either candle goes out it means loss of love on that one's part. If both go out it means both parties were mistaken in their affections. The boats that linger near the shore indicate fear in embarking on strange ventures and lack of confidence in self. This trial of destiny could be presided over by a quick-witted witch who would be able to give many telling "hits." — Mrs. A. Stainton, San Francisco.

Uses for Wrapping Twine

Large quantities of wrapping twine collect in most homes and I find there are many useful purposes to which the various sizes and colors can be applied.

Really attractive kitchen holders can be made by folding the ends of a black stocking leg in so there are no raw edges, then use the gay twine from the drug store to tack the folds together, making flowers in lazy daisy stitch for the centers of the pink and green twine and a border of basting stitch design of blue. Pin a large safety pin in one corner for a hanger.

For rough pot rag, crochet or knit the coarse twine from the hardware store in squares of a suitable size. These are quite as satisfactory as the metal cloths sold for the same purpose.

For a dish or bath rag knit a square of fine twine on coarse wooden needles, and a soft attractive cloth is the result. For hot dish doilies or bath room rugs, crochet over strips of old blue calico, spacing the stitches far apart. Crochet table pads or iron holders of medium string, backed with pink gingham, are attractive and useful. An edge crocheted on our sacks gives a pretty finish for a tea cloth. Soft twines make good padding for embroidered scallops. Jute twine, either dyed or plain, is attractive embroidery material for porch cushions.

Very fine string is excellent for knotting comforts, as well as for cross stitching the edges together. Do not collect your string in a ball, but hang it over a hook so the size and length desired can readily be selected.—Cecilia Stahl, Claremont.

Plant Lemon Cucumbers

It will soon be garden time and I want to tell the Cultivator readers of the way I grow cucumbers. I have cucumbers from early summer until frost off the same vines. I plant lemon cucumber seed by the yard fence. In thinning I pull them out, leaving only one in a place. They cover the fence and bear heavily and are not troubled with aphis as they are when they grow on the ground. I think taking them off the hot ground causes them to bear much better.—Cultivator Reader, Wasco.

NEEDN'T WAIT

"How are we to meet the high cost of living?"

"You don't have to meet it," answered the irritating person. "It overtakes you."—Washington Star.

"Standard" PLUMBING FIXTURES

A BATHROOM is not merely a space in which plumbing fixtures are grouped in the most compact and economical manner.

It is the one room which must give service day and night and year after year. It is the center of home health and comfort, and if in addition to its service value it is attractive and beautiful, its use is a pleasure rather than a necessity.

Better bathrooms make healthier homes.

Write for copy of catalogue "Standard" Plumbing Fixtures for the Farm." It is illustrated in colors, shows complete bathrooms and fixtures, as well as model kitchen and laundry.

Standard Sanitary Mfg. Co., Pittsburgh

In addition to the displays of "Standard" Plumbing Fixtures shown by Wholesale Dealers and Contracting Plumbers, there are permanent "Standard" exhibits in the following cities:

The Future of Dairying in Arizona

THE California dairy industry makes more or less intimate contact with the dairy industry of Arizona, and for that reason dairymen of this state should be interested in the following article by W. S. Cunningham, dairy husbandman, University of Arizona, which appeared in a recent issue of The Arizona Cattleman and Farmer:

During this period of readjustment there is a great deal of uncertainty as to what type of farming will be most profitable during the next few years. The last five years have been unusual ones and do not serve as a basis from which one may judge the future. The experiences of these years, however, teach us conservatism and show us the wisdom of having a balanced agriculture. There is now a trend toward a diversification of crops. This will mean there will be more feed crops and consequently more livestock.

In many counties of Arizona the dairy industry is being built up very rapidly. Cochise County has shipped in more than 20 carloads of dairy cattle during the last year, and Pima, Navajo, Santa Cruz, Apache and Pinal Counties have increased their dairy herds. A part of this development has been because of the exodus of cows from the Salt River Valley. The farmers have considered that this was a good time to secure cows because of the cheap prices. On the other hand, many people have gone into dairying in order to stabilize their incomes. The prices of dairy products are not subject to so great fluctuation as are the prices of feeds and other products. The income from the dairy cow is sure and steady and the marketing of feeds through her is economical and profitable. County agents of the counties of southern Arizona are giving their farmers every encouragement to go into dairying, believing that there is no safer system of farming to follow in the near future.

Of course, not everyone can go into the dairy business. If one is not adapted to it, dairy farming is a great drudgery to him, and if one is indifferent to the importance of sanitation his dairy may be a curse to the consumers of dairy products. Dairying is a very exacting business, requiring constant attention and supervision. The dairy cow is a sensitive animal which responds abundantly to good care and treatment, but which suffers keenly with abuse and neglect. A good cow yields a handsome profit with proper feeding and care, but renders a loss to the man who starves or exposes her to undue hardships. The future will demand of a dairyman that he be a lover of the dairy cow, kind and patient, that he use business methods in his management, that he be clean in his methods of handling dairy products, considering the rights and health of the consumers of the products, and that, above all, he has good cows.

There are certain fundamental problems which will need the attention of all dairy farmers during the next few years. Some of the most important of these are: Increased production per cow, decreased cost of production, effective selling organization, increased consumption of milk and other dairy products.

Increased production per cow may come through the organized efforts of the farmers. It is impossible to get a rapid increase per cow in a community where small herds prevail except through cooperative bull associations and through cow testing associations. A rapid improvement in the dairy cattle is fundamental to keep the dairy industry on a profitable basis. It is not more cows that are needed so much as more milk per cow. Certain investigations have disclosed that in the Salt River Valley during the years 1914 to 1917, the average production of butterfat per year per cow was less than 100 pounds per cow. Some few improved herds averaged about 300 pounds per cow. This indicates that a great improvement must be made in the quality of cows. Thousands of dairy cows should go to the butcher and only good producers be retained. Grade or scrub bulls should be sold for veal or bologna.

Increased production per cow means less cost per quart of milk produced. The feed cost of the production of milk in many instances can be reduced by more careful selection of feed and by improved methods of purchasing. A careful study of crops and methods of cultivation may lessen the cost of feeds; in fact, every item which enters into the cost of producing milk must be scrutinized and reduced, if possible. There is often a great cry for higher prices of dairy products, but the future is going to demand more products at less cost. More milk per cow, then, secured by better breeding and selection of cattle and by better feeding practices will contribute toward the salvation of the dairyman of the future.

Cooperative selling and purchasing by dairymen is only beginning to function in Arizona. Already the dairymen of Tucson and Douglas have formed milk pooling stations for the selling of milk, and these organizations are in position to buy their supplies cooperatively, thereby securing wholesale prices. Cooperative effort for raising the price of milk only will usually fail. But if the object of a cooperative selling organization is to lessen the cost of distribution, improve the quality of the product, to educate the producers of milk to reduce the cost of production and to educate the consumers to the food value of milk, the organization will render a permanent benefit to the farmer and consumer.

The success of any business depends somewhat in getting its merits before the public. The amount of milk used in the United States is estimated to be less than one pint per capita per day. This low consumption is not because people do not like milk, but because they do not appreciate its food value and its health giving qualities. There are many inferior substitutes for dairy products on the market which are gaining a wide usage because they are properly advertised. In fact, they are so well advertised that dairy farmers have been known to sell their cream to a creamery and take home oleomargarine to use in their own homes. It has been definitely proven that butterfat contains vitamines not found to any extent in other foods which are vitally necessary to growth and well being. Users of dairy products are believed to have better health and to lead more vigorous lives on the average than persons not using them.

In comparison with other lines of endeavor the future of dairying looks bright. Through cooperative effort increased production and decreased cost of production can be secured, and by effective selling organization and increased consumption of dairy products the prosperity of the dairy farmer will be assured.

A Better Way of Milking
The De Laval Milker
THE FUTURE of the dairy business is dependent on a better way of milking. Think of the loss in time and loss in production of milking the twenty-five million cows of the United States and Canada twice a day by hand. No other industry of equal importance is laboring under such a handicap, and every year it is becoming increasingly difficult to secure good hand milkers.
The De Laval Milker is the greatest aid to one of the nation's greatest industries. It is a better way of milking. Better because it saves time. Better because it milks the cows with absolute uniformity from day to day, which De Laval users claim actually increases the flow of milk even over good hand milking. Better because it is easy to keep clean. Better because it is built to De Laval standards. And better because it is backed by De Laval service.
The De Laval Milker is ready to serve and save for you now—write for full information.

CALIFORNIA SHORTHORN BREEDERS SALE

The wonderful possibilities for pure bred herds in California are stated in two brief opening sentences in the announcement written by Secretary David J. Stollery for the catalog of the fifth sale of the California Shorthorn Breeders Association, which will be held February 22 at the university farm, Davis. Among the consignments is Ormondale Archer, a splendid dark red son of Golden Goods Jr., not quite two years old and a good herd sire prospect. On the dam's side he traces to Imp. Aconite and is, therefore, a heavy boned beef type. This animal, the first consignment of the McGurk ranch, near Stockton, is a half brother to Little Sweetheart. C. Harold Hopkins has entered, among others, a likely looking roan bull, Hopland Lad 2d, and another fine young roan bull, Caledonia King, has been consigned by George Gardner Pierce.

The entries of the university farm school, always good ones, comprise a heifer and two young bulls, one of them Senator Mayflower, by the noted sire, Sultan Mayflower.

Proud Hero, which is consigned by the Jack London Ranch, has excellent foundation for his pride. He is by the Duthie bred bull, King's Heir, and on both sides there is a long line of Duthie bred animals.

The Fair Oaks Ranch is entering seven fine Shorthorns, including the young sire, Ormondale Chief 2d, and several of his calves. This proven sire is a Cruickshank bull and is by Golden Goods Jr., sire of Little Sweetheart. Count Victor is another sire represented by calves in the Fair Oaks consignment.

The annual meeting of the Western Berkshire Congress will be held at the university farm, Davis, February 23 and 24. The first day will be devoted to the business affairs of the association, including election of officers, and the afternoon of the second day will be occupied with the sale of 30 very high class bred sows and gilts. This annual meeting of the Berkshire Congress has come to be regarded as an important livestock event in this state. In past years many constructive plans for the development of the pure bred swine industry have been inaugurated at these meetings and J. Francis O'Connor, secretary of the congress, writes that he is preparing an especially attractive program for this year.

Warranted to Give Satisfaction
Gombault's
Caustic Balsam

Has Imitators But No Competitors

A Safe, Speedy, Positive Remedy for

Curb, Splint, Sweeny, Capped Hock, Strained Tendons, Founder, Wind Puffs and Lameness from Spavin, Ringbone and other bony tumors. Cures skin diseases or Parasites, Thrush, Diptheria. Removes Bunches from Horses or Cattle.

February 26, Kings County Poland China Breeders Association, Hanford.
February 25, State Poland China Breeders Association, University Farm, Davis.
February 28, Mrs. Nettie Andrews, Modesto.

Assistant Agent Waters of Orange County tells some interesting things that have occurred in the Orange County Association. One herd of 30 cows increased in production from 19 pounds of fat per cow a month in September to 36 pounds in December, due mainly to advice on feeding given by tester Soudin. This increase of 510 pounds of fat is more than some 30 cow herds are giving at this season of the year. Mr. Waters also reports that another herd increased from an average of 27 pounds per cow to 41 pounds per cow in six months time. Another man culled 13 head from a 45 cow herd and only decreased his production 12 gallons per day but saved over $60 per month.

C. B. Wiborg of the Petaluma cow testing association reports a herd average of 41.5 pounds of fat from 57 cows in December. There are not many herds of that size with such an average.

Howard Vaughn, who has recently established a herd of Shorthorns on his Mountain View Ranch near Dixon, is consigning two bulls and two females to the forthcoming sale to be held at the university farm during Stockmen's week. One of the bulls, a red, is a grandson of the noted champion, Cumberland Type, and is out of a Raspberry dam. The other bull is a grandson of Villager. Vaughn also breeds Chester White hogs. It is of interest to know that Mr. Vaughn was the breeder of the boar, Wildwood Prince, one of the great boars of the breed.

Straloch Farm, Davis, has recently bought a number of top hogs from the outstanding herd of Polands owned by A. D. McCarty, Modesto. They include the young boar Frisco Boy, sired by Williams Brothers' Long Boy and out of a daughter of The Yankee. This boar was the third prize junior pig at the last state fair. Among the sows are Liberty Girl 3d, grand champion sow at the 1920 state fair, and considered by many judges to be one of the best sows of any breed ever shown in that ring; Black Beauty C, reserve grand champion, state fair 1919, as a junior yearling; Master Lady and Miss Yankee, third and fourth prize junior yearlings at the 1920 state fair; Barbary Coast, an outstanding daughter of Kansas King, the boar most responsible for Mr. McCarty's remarkable sow herd, and Nuggett Nell, first prize senior pig, state fair, 1919, and fourth prize senior yearling in 1920.

Alcartra Walker Pontiac, a senior three year old granddaughter of Segis Pontiac De Kol Burke, owned by Jane Garden Farm, Sacramento, has just completed a seven day record of 26.11 pounds butter from 456.9 pounds milk. Tessie Leona Cornucopia, a four year old daughter of King Korndyke Sadie Vale 15th in the same herd, has 26.2 pounds of butter in her best seven days to date.

Corn is being shipped in for hog feeding by ranchers of Lassen County, who claim that Eastern corn can be laid down cheaper than California barley can be purchased.

The list of cosignors to the annual spring sale to be held under the auspices of the Pacific Coast Hereford Cattle Breeders Association during Stockmen's week at the university farm, February 23, made public by Secretary John A. Bunting, discloses a number of new names along

Guernsey Females

Our herd reduction sale still continues and there is a lot of fine Imported and A. R. cows with high production records and show ring honors left to be sold. We are also offering the choicest lot of young stock ever in one herd in the West. A number of bulls of all ages from the above sired by King of Hollow-Hill and Effie's King.

Also 30 head of females 15/16 Guernsey that will make wonderful family cows.

All T. B. tested and guaranteed breeders.

Everything Priced Reasonably.

Attention Duroc Breeders

I am offering for sale Golden Cherry 264101, my two year old boar by Great Model and out of the great sow, Cherry Blossom. Here is a pioneer sire and real herd header. Also have a few young boars and gilts for sale. Prices reasonable.

C. E. BORDEN

P. O. Box 51 — Oceanside, Cal.

with the "old guard" which can be taken as an indication of the interest being accorded this breed. Among the men to make their first consignments are: Roland Bass of Standish, who is sending forward eight head; James McMermy, Carlton, Oregon, three head; A. H. Barnum, Moro, Oregon, three head; George H. Harwood & Sons, Milford, Oregon, one entry; R. J. Prewitt, Antioch, three head, and the Napa state farm, Napa, four head. Other consignors are: J. H. Cazier & Sons, Wells, Nevada; University of Nevada; H. H. Gable, Esparto; W. J. Bemerley, Woodland; Finnell Stock Farm, Galt; H. M. Barngrover, and the University of California. The sale will consist of 60 head and it is stated that the offering will be of more uniform quality than the one sold last spring. The sale is to be managed by The California Breeders Sales and Pedigree Company, Sacramento, and Col. H. L. Hull of Iowa will be the auctioneer.

Each sale of Shorthorns in California develops some new breeders and at the sale at Davis on February 22 beginners will have an excellent opportunity to select a bull of best type and breeding from the seven bulls in the Milmar herd consignment. The character of the Shorthorns produced in this herd shows that Mr. Miller made no mistake in choosing only the best bulls available to head his herd and emphasizes the importance of proper herd bull selection. The two heifers contributed by this breeder will receive favorable attention and are of the sort that belong in first class herds.

A new Class F champion record of production for the Guernsey breed was recorded November 6, 1920, at the conclusion of a 12 months test by Katherine's Trixie, owned by Walter C. White, Ohio. Trixie's milk production for the period November 8, 1919-November 6, 1920, was 18,945.7 pounds, giving her a margin of 3,416.9 pounds over the previous record, held by Langwater Hope. Her butter fat record was 791.48 pounds. Katherine's Trixie was sired by Madge Chena's King of Anna Dean Farm, he by Ollie's King of Belle Vernon 2d. Her dam was the imported Trixie of the Isle, a cow with wonderful conformation and production qualities. Katherine's Trixie was born April 10, 1917, making her two years, six months and 28 days old when she began her test.

At the last meeting of the state agricultural society Henry A. Jastro of Bakersfield was elected president to succeed George C. Roeding of Fresno, who did not seek reelection. Chas. W. Paine was again appointed secretary and T. H. Ramsay of Red Bluff will serve as chairman of the livestock department.

C. R. Thomas, manager of the Los Angeles Livestock Show, has returned from the Cornbelt, where he selected 24 Shorthorn bulls. Mr. Thomas reports the sale of 14 out of the shipment to buyers in the vicinity of Reno. In commenting on the general cattle situation Thomas stated that range men in this state were demanding a better class of bulls than they have bought in the past.

D. D. Aitken, president of the Holstein-Friesian Association of America, addressed a crowd of 250 breeders and dairymen at Modesto, February 10. The meeting was arranged by members of the Stanislaus County Holstein Breeders Association. President Aitken stressed the value of better blood and management in the solution of the economic problems of the dairy industry.

Wm. Way, Modesto, reports sale of the boar Lord's Orion Cherry King to F. W. Bartlett Jr., Tracy. Mr. Bartlett has recently purchased a number of pure bred sows, and this boar, formerly used in the herds of Elmer Lamb and Mr. Way, is sure to be of great value in the new herd.

Earl J. Sturgis, who has been identified with the Holstein business in this state for many years, first with Morris & Sons and later as the superintendent of the Santa Anita Rancho, has taken charge of the Holstein herd of Fred Hartsook at Lankershim. Mr. Hartsook has purchased many wonderful animals during the past year and under the direction of Mr. Sturgis the herd should become one of the leaders of the state. Mr. Sturgis, who is a director of the State Holstein Association, has developed many of the great cows of the coast and has many times broken the various short time and yearly records of the Holstein Association.

Oakmere Ranch, San Diego, has just sold two fine Duroc gilts to the Hampton Ranch in Sacramento Valley. The pigs were sired by O. R. King Pilot, one of the herd boars of Oakmere. During January there were 73 pigs born at Oakmere from nine sows, making an average of 8.1 per litter.

LOS ANGELES COUNTY FARM WINS CULTIVATOR PRIZE FOR JANUARY

The prize for the highest production of butterfat by five grade cows entered in the state dairy cow competition for the month of January was won by Los Angeles County Farm at Hondo, for an average production of 78.45 pounds butterfat per cow, and the California Cultivator prize for this month was therefore awarded to this farm.

The production of the individual grades for the month was as follows:

Yr-Mo	Milk	Days in Milk	Milk, Lbs	Butter Fat — Percent	Butter Fat — Lbs	Credit
Amador	11-	6	1919	4.5	86.34	86.34
Mariposa	3-3	13	2080	4.1	85.27	100.62
Modoc	3-3	6	1547	5.4	83.54	98.58
Butte	4-2	7	1466	4.9	71.97	77.73
Alameda	4-10	5	1589	4.1	65.13	68.39
Averages		7	1720		78.45	86.33

This is the second time that grades in the dairy herd of the Los Angeles County Farm have won this prize. Other groups of five cows eligible for competing for the prize produced, on the average, as follows during the month of January:

Earl Graham, Compton, 71.91 pounds (credit 82.05 pounds); Adohr Stock Farms, Van Nuys, 67.57 pounds (credit 71.02 pounds); R. H. Walrath, El Centro, 66.97 pounds; F. F. Pelissier, Whittier, 65.67 pounds; S. G. Gambonini, Petaluma, 50.07 pounds (credit 51.48 pounds); University of California, Berkeley, 41.75 pounds (credit 46.22 pounds); J. M. Christen, Pacheco, 41.70 pounds (credit 45.81 pounds).

It is interesting to note that five out of the seven competing herds are located in Southern California, and that this is the fourth time that the California Cultivator prize has gone to this section.

TREMENDOUS HERD REDUCTION SALE

Santa Anita Rancho, owned by Anita M. Baldwin, Santa Anita, will be the scene of one of California's greatest public sales on April 21-22 when 100 registered Holsteins, about 40 registered Poland China hogs, and possibly some other high class livestock will go under the auctioneer's hammer.

The herds at Santa Anita have multiplied until their present size is taxing the carrying capacity of the rancho, and this sale will be the means of a reduction throughout, leaving herds of very substantial size for future breeding operations.

The Holstein offering will be a notable one, including two of the herd sires, the grand champion Merci Lad Korndyke Burke and Prince Walker Cornucopia, the 36 pound son of Prince Gelsche Walker. After this sale the $41,000 bull, King Korndyke Pontiac Acme, will have the herd heading honors to himself. The sale will be managed by California Breeders Sales and Pedigree Company, Sacramento, with Col. Ben A. Rhoades, Los Angeles, on the block.

HOG AUCTION SALES

California Farm Bureau Marketing Association announces the following dates for hog auctions for the remainder of this month: Turlock, 17; Merced, 16; Madera, 17; Fresno, 18; Bakersfield, 19; Tulare, 22; Visalia, 23; Hanford, 24; McFarland, 25.

A PROCLAMATION

FROM the time of the Mission Fathers to the present time the culture of the olive in California has been one of the honored and distinctive industries of the state.

For years the flavorous olive ripened in California's groves has been recognized not only as one of the earth's most nutritious foods but also as one of its choicest delicacies.

Therefore, I, William D. Stephens, Governor of California, hereby appoint and designate Monday, the 21st day of February, 1921, as California Ripe Olive Day, and I urge all loyal Californians to join in this effort to extend the use of this distinctive California product, thus promoting the well being of the industry and the prosperity of the industry and the prosperity of the state.—Wm. D. Stephens, Governor of California.

POLAND CHINA BREEDERS SALE

On Friday, February 25, the state Poland China Breeders Association will hold its annual sale at the university farm at Davis. This sale will be on the last day of Stockmen's Week and should attract a good crowd of buyers. The last few pure bred hog sales have been encouraging to the breeders. While the prices have been nominal, the demand is growing stronger. The offering is a carefully selected one from the best herds in the state and will afford good selections for the buyers. A. J. Elliott, Tulare, and Secretary H. K. Dickson, Bakersfield, have both been working very hard on this sale and deserve the support of all interested in Poland China hogs.

MRS. ANDREWS TO DISPERSE HERD

On Monday, February 28, Mrs. Nettie Andrews, Modesto, will sell some of her herd of big type Poland China hogs. The feature of the sale will be fine sows bred to I Am King, that stood fourth in the junior yearling class at the strong Sacramento show last year. This in itself is quite a recommendation for any boar. In addition to this he has proven himself a very strong breeder. There will be 25 bred sows and gilts in the sale.

Prof. L. F. Fletcher of the agricultural engineering staff of the university farm will conduct a two days tractor school in Ventura County about the middle of March.

Blackhawk Ranch

Diablo, California

Have Entered Six Choice Bulls in

SALE OF SHORTHORNS

AT DAVIS

Tuesday, February 22, 1921

They are all sons of the great breeding bull, Roan Radium, who sired Blackhawk Villager, Grand Champion at Los Angeles Livestock Show, 1920. Roan Radium was also sire of Grand Champion Steer at last State Fair and also sire of winners in Get of Sire and Produce of Dam classes at same show

Included in offering is Blackhawk Archer, out of a Cruickshank Violet dam. We consider this calf worthy to go to a good herd.

60 REGISTERED Herefords

At Public Auction

Wednesday, February 23rd

A Splendid Opportunity for Buyers of Bulls

During the past few years Pacific Coast Hereford breeders have made very substantial improvements in their herds, through the purchase of high-class bulls for their herd sires and the addition of breeding females highly bred in the most productive families of the breed. The offspring of many of these high-class animals are now appearing in the public sales, and in this sale there will be a selection of bulls for range service that has certainly never been excelled in breeding by any previous public sale offering of the breed in California. Remember also that the type of these bulls was passed upon by the noted judge, Mr. Frank Van Natta, before they were admitted to entry in this sale.

Females of Substantial Breeding and Individual Merit

The female offering in this sale provides another excellent selection of foundation breeding material, at a time when the founding of a registered Hereford herd is most promising as an investment or as a life work. Besides being a well-bred lot of good type and character, many of these females have calves at foot by or are bred to such bulls as Patrician 5th, Beau Blanchard 76th, Beau Blanchard 48th, Beau Blanchard 37th, and others.

The Sale Contains

39 Registered Hereford Bulls 21 Registered Hereford Females

Tuberculin Tested—Guaranteed Breeders

THE FACT that Herefords topped the great Chicago market over 77% of the selling days of the year 1920 is one of several chief reasons why there is such a tremendous demand for registered Hereford bulls to head the range herds that supply these profit makers to the feeder or market.

THE FACT that there is such a strong demand for registered Hereford bulls is only one of the several chief reasons why the breeding of registered Herefords is a sound business to get into and stay in.

REMEMBER THAT in California in 1920 there were more registered Herefords sold at public sale than in any two previous years, and still the demand for breeding animals remained unfilled, and that for the first time the Hereford exhibits at California State Fair exceeded in numbers the exhibits of any other beef breed.

THERE ARE REASONS for this ever-increasing popularity of HEREFORDS, every one of which is founded firmly upon the dollars and cents return to the men who find the sure way to more economical production and greater profits through the use of good HEREFORD blood.

Sheep Parasites

SHEEP probably suffer more than any other kind of livestock from parasites. They are practically immune to tuberculosis, which is one of the serious ailments of cattle and swine, and among sheep there is nothing comparable to the devastating outbreaks of cholera among swine. Sheep have comparatively few bacterial diseases. Nevertheless, there is a steady loss of sheep in all parts of the country, and this loss is mostly due to parasites. To inform sheep raisers how to combat these parasites and prevent their appearance in the flock, Farmers Bulletin 1150, Parasites and Parasitic Diseases of Sheep, has just been published by the United States department of agriculture. It describes the most common of these diseases, giving the symptoms, treatment and preventive measures.

It is the sheep owner's business to prevent disease rather than attempt to cure it after it has made its appearance. While there are special treatments for the various diseases, which makes it advisable to call a competent veterinarian, there are a number of ways to prevent diseases caused by parasites. Among these the bulletin suggests pasture rotation, use of forage crops, feeding from racks or board floors, draining or filling swamps, and preventing wandering dogs from getting into the flock. Permanent pastures perpetuate parasites. The eggs of the internal parasites pass from the animals in the manure and thus the pastures become infested. The proper disposal of the manure will aid in preventing this.

Damage from parasites is greatest, as a rule, among lambs and young sheep. Hence, it is important to pay special attention to the care and handling of lambs and yearlings. Animals which are troubled with parasites usually do not have fever, but they are unthrifty and will lose rather than gain in weight. As a rule, also, there is some intestinal disturbance, shown by diarrhea or constipation. Unthriftiness may persist for long periods and may have a fatal termination. Prompt action to ascertain the cause when sheep become unthrifty will often prevent serious loss.

Parasites of sheep are divided into two general groups, external and internal. Among the former, lice, sheep ticks and scab mites are the most common. One application of sodium fluoride in the form of a powder rubbed into the skin will kill biting lice, but not sucking lice. Both kinds of lice, sheep ticks and scab mites, are destroyed by dipping the sheep. For lice and sheep ticks a number of dips are recommended in the bulletin, including coal tar creosote, cresol and nicotin, or nicotin and sulphur. For scab mites the official dips are lime-sulphur and nicotin-sulphur. Arsenical dips are not well suited to sheep dipping. All places which have been occupied by lousy sheep should be regarded as dangerous from this standpoint for a period of three weeks; if occupied by ticky sheep, as dangerous for two months; if occupied by scabby sheep, as dangerous for a month or two in the case of pastures, and a year or more in the case of buildings. Quarantine measures are essential in eradicating scab.

The most common internal parasites of sheep include tapeworms, flukes, roundworms, and a few other forms such as the maggots causing grub in the head, the tongue worm and the one celled protozoa. One of the most common of these is the grub, infestation with which can be largely prevented by smearing the nose of the sheep with a preparation made of equal parts of tar and grease or tar and fish oil. Other important internal parasites discussed in the bulletin are tapeworms, the gid parasite, hydatid, liver flukes, stomach worms, nodular worms, hookworms and lungworms. Of these, certain tapeworms are fairly common over the entire United States; one tapeworm occurs only in the West; gid is most prevalent in Montana; liver flukes are most common in the Gulf states and the Pacific Coast states; stomach worms and lungworms take a heavy toll in sheep in almost every state in the Union; and nodular worms and hookworms are common in the South and East.

Copies of the bulletin can be obobtain free by writing to the United States Department of Agriculture, Washington, D. C.

Shorthorn Prize Appropriation

The board of directors of the American Shorthorn Breeders Association voted at its January meeting to continue the appropriations for Shorthorn prizes for 1921 practically the same as in 1920. In a number of instances the appropriations have been materially increased. In others, where the fairs have not taken advantage of the association's cooperative attitude, there have been reductions or eliminations.

The scope of these prizes includes state and district association sales and shows, county fairs, champion bull prizes being offered in the county fairs as heretofore, calf clubs, United States bred Shorthorns winning championships at six of the more important Canadian fairs and shows, district, state, interstate fairs, national and international shows.

A very important ruling was passed relating to show entries, as follows: "Where it is found that any animal entered in competition for association money has been operated upon or altered in any way for the purpose of hiding natural defects of form, the exhibitor shall be denied the further privilege of competing for premiums offered by this association."

A comprehensive breeding and health guarantee was approved and is recommended to Shorthorn breeders in general, as follows:

Proper care shall be given to protect breeding qualities and health of animals.

All bulls guaranteed breeders. A bull should not be allowed to serve when under 14 months of age or allowed to run with herd while under 20 months.

Cows with under four months calves by side are considered proven breeders.

All other cows and heifers sold as a single lot guaranteed breeders; calves, however, sold by side of dam as one lot not guaranteed.

Heifers should not be served for first calf by heavy or old bull.

Cows and heifers over three months gone in calf, according to service date furnished at time of sale, but not proving in calf, must be reported to seller within three months from date of sale; all others served within three months of date of sale not proving in calf or not settled, must be reported within six months.

Heifers not settled when 22 months old shall be promptly reported. (Heifers over 16 months sold open, not settling within six months of date of sale, should be promptly reported.)

Any animal not proving up to foregoing guarantee shall be replaced with another of equal value at the time of purchase to the satisfaction of purchaser, or purchase price refunded, with no allowance for expenses or interest on money. Salvage to go to seller.

All animals offered at public auction sold subject to a 60 day retest, or to comply with laws of state into which animals may be shipped.

Animals to be segregated from buyer's herd until retest is made, except herd be an accredited one.

All tests for tuberculosis—either test before sale or retest—should be made by a federal or state veterinarian or veterinarian deputized by state veterinarian, who is cooperating with federal veterinarian and qualified to do accredited herd testing.

Articles of incorporation for the Santa Cruz County farm bureau exchange have been certified. A membership fee of $30 is required and the transactions will be entirely upon a cash basis.

In order to dissolve the partnership existing between J. M. Crawford and H. E. Spires, the Victory Herd of registered Holsteins will be dispersed at public auction on their Hillcrest Farm, Carruthers, on Thursday, May 5. This is an offering of merit, the herd containing many highly bred females, including several granddaughters of Pontiac Korndyke, and headed by a son of the famous King Segis Pontiac Count as senior herd sire and by a 36 pound son of the Bridgford three times grand champion, King Segis Alcartra Prilly. The dam of this bull is also making right around 1,000 pounds butter this year. This sale will be managed by California Breeders Sales and Pedigree Company, with Col. Ben A. Rhoades on the block.

LOBBY—PAYING TAXES

(Continued from Page 238.)

like the word politics, is often misused, and we are all prone to use these words in their lower meanings. The lobby at Sacramento, there to give information to committees and to legislators, is entirely within its rights and perhaps working in the best interests of the state. We admit that at the time of writing those other words we had in mind the lobby as it existed a dozen or a score of years ago, when large corporate interests legislated for this state more truly than did those who were elected. At least such were the charges in those days.

The fear that such a lobby may return to Sacramento makes Californians stand at attention when thoroughly organized and powerful committees are not only informing legislators as to needs of their clients, but bringing great pressure to bear.

Now if the financial requirements of the state for the next biennium can be lessened and the King bill so changed as to lighten the burden on the corporations, it appeals to us that it would be a most wise step. We are told that California's tax bill is vastly higher than the average of other states. Let us lower it. In other words, instead of fitting our taxes to the budget, let us make our budget according to the amount of money which can be raised. But if the effort is to be made to raise part of the taxes on an ad valorem basis and put an unjust burden on the farmers, there is only one step they can take as a matter of self preservation, and that is entrance into a vigorous fight. They cannot say, as does the corporation, "Put the tax on us and we will simply pass it on to the consumer; we will not bear it ourselves." We wish they had not said that. It doesn't sound American.

CANNED FRUIT

What is the canner, and incidentally, or maybe primarily, what is the grower going to do with the vast quantity of last year's canned fruit still in storage? "Sell it to folks and let them eat it" is perhaps the quickest suggestion, and that is exactly what Mr. Canneryman and Mr. Grower are both anxious to do, but the world's appetite has of a sudden become very delicate. There are dozens of reasons for this condition, and we need not discuss them here, for none of them seem to lead to the answer to the question, "What are we going to do with the canned stuff?" We rather think in time we will be able to sell it and with it another large pack which should be put up this coming summer, but we may have time to think again before its accomplishment. Commenting on the seriousness of the situation, Vernon Campbell, vice-president and general manager of the California Cooperative Canneries, says:

"Today we have in the cannery warehouses of California some 6,000,000 cases of canned fruits, more than we packed in any one year before war demands brought about the great growth of the canning industry. And yet we only packed half a case of fine fruits for each family in the United States—one can a month for each family. This does not seem like overproduction, and yet less than half of our pack has been sold. Foreign markets will help absorb our increasing production, it is true, but we could sell every case of canned fruit that can be produced in this state for some years to come right here in this country, had we an efficient system of distribution which placed the fruit in the hands of the consumer at the right prices.

"The same conditions that affect the canned fruit market are affecting the marketing of our Santa Clara valley prunes and our other great crops which are now largely in the hands of the growers' organizations.

"The problem of marketing, the difficulties attendant upon the establishing of a more direct method of distribution, can best be solved through the power of cooperation, and this cooperation should be extended to include the various associations in one great powerful marketing organization for California."

The 1630

Allis-Chalmers

Farm Tractors

Here is a four plow tractor better adapted to California Farming and a bigger value. In construction, mechanical perfection and efficiency, it is a masterpiece, designed and built by the master-minds of the tractor industry in the $42,500,000 plant of Allis-Chalmers at Milwaukee.

In tractor buying you should demand just those features that make the Allis-Chalmers so superior—that makes it deliver full-rated power and do the work of 8 horses at one-third the cost. Not only the most economical in operation, but also in upkeep.

The reliability of the distributors is another factor, too. Get more information right away by sending in the coupon today.

Poultry Queries

Conducted by J. A. Koethen

Liver Trouble

Will you please tell me what is causing liver trouble among my hens? Several have died, and on examining them I have found the liver covered with white spots. Sometimes the hens are very thin. I have about 50 Anconas and am feeding barley morning and night and a laying mash at noon. They have milk (sometimes sour) before them all the time and a green field to run in. Is their ration too rich? The hens do not seem as lively as they should. Do you think they need a tonic in their mash or should their feed be cut down? Their sleeping quarters are dry and in a closed house. — Subscriber, Watsonville.

The crux of the matter is those white spots on the liver. What is their character? If they are nodules of a cheesy appearance and occur not only in the liver but in the spleen and intestines, they indicate that your hens have not liver trouble, but tuberculosis. If the liver is enlarged and "marbled or spotted" or very soft, then we may assume that the hens have liver trouble. The fact that some of the hens are very thin points to tuberculosis. It makes little difference what the trouble is, save that liver trouble is curable and tuberculosis is not. Your ration does need some alteration in any case, and when you have made that and given your hens the cleanest and most sanitary environment possible you have done all that can be done except to burn and bury deep the carcasses of those that die. First get them out of that closed house. If you cannot move the hens rip a side off the house and let the air in. Bad air is the most fertile cause of tuberculosis in man or beast. Second, I notice you are feeding no grain but barley. That is hard on livers. Better feed wheat, even if it does cost more, or use this mixture which is recomended by the poultry division of the state university: 100 pounds whole or rolled barley; 50 pounds Gyp corn or milo maize; 50 pounds cracked Indian corn. If you feed wheat you might make the formula 100 pounds wheat and 50 pounds each of Gyp or milo and Indian corn. In the third place, you do not need a mash containing beef scrap if your hens have milk before them all the time. It would be a good plan, just for a change, to give, instead of the mash, a hopper of bran or mill run with five per cent ground bone added. This is a maintenance mash, and while it will not make so many eggs it will help the hens to recover from the effects of a too forcing ration. When they seem more lively you might make the mash equal parts bran, shorts and corn meal, with now and then a little beef scrap added. Keep this before them and let the commercial mash go for a while. Bran, you know, is laxative, and will help to clear out their systems if their livers are overworked. A handful of charcoal in the mash will also be beneficial. You do not say how much grain you are feeding. With the mash before them all day, a quart of grain at night for 12 hens is ample, and if you have been feeding more it would be well to give less for a time. The mash you have been using is rather forcing, I think, and when you begin to use it again add an equal amount of bran. No tonic is needed. Just give nature a chance.

Ancona History

Can you not give us an article on the origin and history of the Ancona? —Subscriber.

The family history of the Ancona is very short and soon told. It is a Mediterranean breed and, according to Harrison Weir, is simply the common fowl of Ancona, Italy. The breed was first exhibited in England in 1853 and was described as having at that time "black and white patchy plumage." The beautiful greenish sheen which is so noticeable a characteristic now is credited to crossing with Dark Cornish. It is only within the last ten years that the Ancona has become well known in this country.

Feeding Hens

How much feed should be given a dozen laying hens a day, and what kind is best to make them lay?—Subscriber, Garden Grove.

I cannot do better than quote from the latest feed letter of the poultry division: "Approximately one pint of grain should be fed to 15 fowls of the lighter breeds, such as Leghorns, in the morning, and 1½ pints to 15 hens at night." "This makes a little over a quart for 15 hens, or a quart for a dozen. The ration recommended in this letter is as follows: Grain mixture: 100 pounds whole or rolled barley; 50 pounds Egyptian corn or milo maize; 50 pounds cracked Indian corn. The mash mixture, which may be fed ether moist or dry, but is usually fed dry in hoppers and kept before the hens constantly, consists of 50 pounds each of wheat bran, shorts and ground barley; 10 pounds soy bean or linseed meal; 10 pounds cocoanut, soy bean, linseed or cottonseed meal or ground beans; 30 pounds meatscrap or fishscrap; 5 pounds fine granulated charcoal; 1 pound finely sifted dairy salt." To this grain and mash must be added all the green feed the birds will consume and a constant supply of fresh water.

Feeding Turkeys

How much feed should be given turkey hens per dozen birds and how much to young turkeys six months old that are to be fattened for Easter?—Mrs. D., Garden Grove.

Frankly, I do not know. I have never seen any figures for turkey rations. The adult turkey is a very hardy bird and can usually be trusted not to eat more than it needs. Breeding hens should have a good feeding of wheat and oats—hulled oats are best—at night, and should be on range during the day. If they are confined they should have a great deal of green feed. For best results an occasional meal of beef scrap mixed with bran or of cooked meat such as beef liver or lungs should be given. Grit, shell and charcoal should be before them at all times. Confined birds should have green feed in some form before them constantly—grain sown in the pens is best. Young stock is fattened mostly on corn and barley. Gradually accustom them to the corn by feeding lightly at first. You might begin with cracked corn and then mix in a little whole and a little more day by day till whole corn has entirely taken the place of the creacked. At first the birds should be kept a little hungry, the grain being given only night and morning, but the last week or so before they go to market they may be fed all they will eat three times a day. One turkey raiser I have met kept the grain before his birds all the time the last two or three weeks. In feeding turkeys it is necessary to watch them closely and be guided in feeding by their appearance and behavior. As long as they act hungry they are not getting too much.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, January 31, 1921. Report for week ending January 30.

In the thirteenth week of the laying contest at Storrs a pen of White Leghorns entered by Ernest H. Scott of Farmington, Connecticut, tied for first place with another pen of the same breed owned by James O. Le Fevre of New Platz, New York. Each pen laid 44 eggs. Leghorns are expected to lay more eggs in the summer months, but it is very unusual at this season of the year to find that out of the six best pens for the last week in January five of them are White Leghorns.

Rhode Island Red No. 354, bred by Chas. H. Lane of Southboro, Massachusetts, has just made a splendid record for consecutive laying. Beginning November 30 last this pullet laid for 53 days without missing. This does not establish a new record at Storrs if the whole year is considered, but heretofore high consecutive layers have made their records in the spring and summer months, whereas the pullet in question has laid consecutively in midwinter during the season of very high prices. In less than two months this one hen had laid $4 worth of eggs. A flock of pullets like this would be profitable beyond the im-

GERMOZONE

"the Best Remedy for Poultry and Pet Stock"

The old reliable, proven remedy for Roup, Colds, Canker, Swelled Head, Bowel Trouble, Snuffles, Wounds, Sores, Loss of Fur or Feathers, Skin Disease, Etc.

H. A. Kiewert, 5042 N. Long Ave., Chicago, Ill., says: "I had some of the worst kind of cases of roup in my chickens and I thought I would not save any but I have saved these birds, thanks to Germozone." H. A. Haines, Rosalia, Kas.: "If we had tried Germozone at first it would have saved us $1,000 worth of expensive experiments." Mrs. T. A. Morley, Galien, Mich.: "Have used Germozone 17 years and could not get along without it." E. W. Thiel, Waukesha, Wis.: "I have used your Germozone for white diarrhoea in baby chicks and sure got wonderful results. I also use it right along on grown fowls."

Germozone is sold by most drug, seed and poultry supply dealers, or mailed postpaid in 25c, 75c and $1.50 packages, from Omaha. Poultry Book and Book on Diseases FREE.

agination of the most enthusiastic poultryman. The total yield for all pens amounted to 2,287 eggs, or a yield of nearly 33 per cent. While this is an increase of nearly 300 eggs over the score for the previous week, it is still a little less than the six year average and nearly 200 eggs below the record for the corresponding week for last year.

The four leading pens in each of the principal varieties are as follows:

Plymouth Rocks

W. H. B. Kent (Barred), 429 eggs; Rock Rose Farm (Barred), 302; Ernest W. Picker (Barred), 290; Oregon Agricultural College, 248.

Rhode Island Reds

Charles H. Lane, 432; F. S. Chapin, 394; H. S. Bickford, 381; Deer Brook Poultry Farm, 378.

White Leghorns

A. P. Robinson, 399; James O. Le Fevre, 386; Lion Head Poultry Farm, 363; Max Axelrod, 352.

Other Varieties

Obed G. Knight (White Wyandotte)-488; H. P. Cloyes (Buff Wyandotte), 305; Harry D. Emmons (White Wyandottes), 204; Clemens J. Diemand (White Wyandotte), 200.

DESICCATED SKIMMILK FOR POULTRY

A Humboldt County dairyman has perfected a method of evaporating skimmilk and buttermilk, making an article especially adapted to poultry needs.

The finished product is in a dry, finely granulated form, according to the inventor, contains all the milk nutrients except butterfat. Unlike most other milk poultry foods its content of lactic acid is very low. This is possible because of the sweet cream butter made in Humboldt. Having a low percentage of lactic acid the food is not fed for its tonic value only but is a well balanced ration in itself, containing a large amount of protein, and can be fed continually as a laying ration, it is claimed.

NATIONAL EGG LAYING CONTEST

Mountain Grove, Missouri, report for January.

The number of eggs laid by the different breeds for the month and to date are: Wyandottes, 809, 2,208; Plymouth Rocks, 785, 1,682; Leghorns, 760, 2,116; Rhode Island Reds, 760, 1,773; Anconas, 688, 2,017; miscellaneous varieties, 659, 1,744.

The ten leading pens for January are: White Wyandottes, Missouri, 115 eggs; Columbian Rocks, New Jersey, 113; Barred Rocks, New York, 110; S. C. White Leghorns, Missouri, 109; S. C. Reds, Missouri, 103; S. C. Reds, Missouri, 103; S. C. Reds, Missouri, 101; R. I. Whites, Illinois, 99; White Wyandottes, Missouri, 97; S. C. White Leghorns, Washington, 95; Barred Rocks, Illinois, 95.

The ten leading pens to date are: S. C. White Leghorns, Washington, 329 eggs; S. C. White Leghorns, Missouri, 309; White Wyandottes, Missouri, 300; S. C. Reds, Missouri, 281; S. C. White Leghorns, England, 279; Columbian Rocks, Missouri, 274; Buff Orpingtons, Missouri, 273; White Wyandottes, Illinois, 270; White Wyandottes, Missouri, 267; S. C. White Leghorns, New York, 250.

THE FARMER'S SECRET

A farmer met another farmer driving in a narrow country lane in the deep snow of winter.

The track was only broken in the center of the road, so that turning out was difficult.

When the two met, the first farmer blustered:

"If you don't turn out for me I'll do to you what I did to the last man I met who wouldn't turn out for me!"

Much alarmed, the second farmer pulled out into the deep snow to let his belligerent neighbor pass.

When he was back on the road again he turned and said to the farmer:

"Tell me, neighbor, what did you do to the man who wouldn't turn out for you?"

"I turned out for him," replied the hot headed farmer.—Answers, London.

Healthy Hens *and* Fertile Farms

Dust AGRI Gypsum in the chicken yard, on the floor of the chicken house, and on the roosts, and you will not only protect and improve the health of the poultry but get a fertilizer that is worth many dollars.

When exposed to the air, chicken manure gives off ammonia, thereby dissipating its most valuable fertilizing element, nitrogen. These chemical fumes are, at the same time, very harmful to poultry. This also is responsible for the offensive odor. So by using AGRI Gypsum which absorbs and retains the ammonia you gain three ways, in healthy hens, an odorless chicken yard and a valuable and potent fertilizer.

AGRI Gypsum is an all-around fertilizer, a corrective for black alkali, a loosener of adobe, and a stimulant for all soils. Be sure you get AGRI.

SULPHUR

It has been proven and so recommended by the University of California that if you sulphur your grape vines and orchards six times they will not be affected by MILDEW or RED SPIDERS.

ANCHOR Brand Velvet Flowers of Sulphur, also EAGLE Brand and Fleur de Soufre, packed in double sacks, are the fluffiest and PUREST sulphurs that money can buy; the best for vineyards; the best for bleaching purposes, LEAVING NO ASH.

VENTILATED Sublimed Sulphur—Impalpable Powder, 100% pure, in double sacks, for Dry Dusting and making Paste Suphurs.

For LIME-SULPHUR SOLUTION, use our DIAMOND "S" BRAND REFINED FLOUR SULPHUR. We can furnish you this sulphur at such a low price that it would pay you to mix your own solution and net you a profit equal to the amount paid out for labor in spraying your orchard, even if you pay your men $5 per day for making the solution and applying same.

To create additional available plant food and prevent smut in grain, drill into the soil 220 POUNDS PER ACRE of TORO BRAND SPECIALLY PREPARED AGRICULTURAL SULPHUR — or our DIAMOND "S" BRAND REFINED POWDERED SULPHUR. This soil treatment has increased various crops up to 500%. Send for Circulars No. 6, 7 and 8.

Also PREPARED DRY DUSTING MATERIALS, Tobacco Dust, Dusting Sulphur, Mixtures, etc.

Carried in stock and mixed to order.

SAN FRANCISCO SULPHUR CO.

Middlings: 48.00@52.00.

Milo: Cal. Red, 1.95@2.00; Eastern 1.60@1.70.

Kafir: Eastern, 1.60@1.70.

HAY

Under date of February 12, A. W. Scott Co. says:

Arrivals of hay for the past week have been 952 tons. Notwithstanding that receipts continue heavier prices have been maintained on the San Francisco market. A little better tone is also manifest among the buyers here as there seems to be a little more general business making the consumption of hay in San Francisco a trifle heavier than it has been.

A temporary lull in the dispatch of vessels has reduced the export demand to a very low point this week. The country dairy demand has been better and a general inclination on the part of alfalfa raisers to let go has created active trading from the alfalfa centers, particularly the San Joaquin districts, and reaching even far to the north of the state. The differential in freight between Nevada and California is so favorable to our districts that comparatively little Nevada hay has been handled recently. Of the different grades probably the cheaper oat hay has been doing the best owing to the demand for dry stock feeding or for draft stock that is not working.

Citrus Markets

Los Angeles, February 16, 1921.

Oranges have been rather quiet but owing to the rain delaying picking a slightly firmer condition prevails. Some of the state's finest crop is going out this year, and severe culling is holding up the brand. For the first season some sections are showing serious injury, sometimes as high as ten per cent from the orange tortrix. This pest is making culls of some of the finest of fruits.

Lemons are much firmer and a few very good sales are being made.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 6,525 cars; lemons, 1,716; total, 8,241. To same date last season; Oranges, 6,794; lemons, 1,548; total, 8,342. From Central California to date, this season: Oranges, 4,008; lemons, 84; total, 4,092. To same date last season: Oranges, 3,439; lemons, 200; total 3,639. From Northern California to date this season: Oranges. 305; lemons, 4; total, 309. To same date last season: Oranges, 261; lemons, 21; total, 282.

KINGS COUNTY ORGANIZES MARKETING EXCHANGE

The Kings County farm bureau has organized a marketing exchange and has just received its charter, and as soon as the necessary membership is secured to insure sufficient volume of business to operate economically the exchange will hire a competent manager to take charge of its affairs.

Result of Successful Hog Sales

The present organization is probably the result of the successful hog auction sales for which the county has been noted during the past few years. During the past year the sale of hogs alone through the farm bureau has returned to the members over $320,000, and during the three years that these sales have been in operation the revenue to the producer has been in excess of $840,000, so this one item of marketing is no small item of business for the new organization, as it is the plan of the exchange to take over the management of these sales.

The farmers of the county feel need for a better method of marketng veal calves and this branch will probably be organized at the earliest possible moment.

Grain Elevators Essential

One of the really big things now being planned in Kings County is the erection of grain elevators to handle at least a part of the wheat and barley crop of the Tulare Lake region. Perhaps few people realize that this district, which is almost entirely in Kings County, produces annually seven and one-half millions of dollars worth of wheat and barley. It is the present plan of the grain department to erect two storage elevators, one at Corcoran and the other at Stratford. These elevators will of course handle only a part of the total crop, but it is hoped that some of the large operators will erect elevators and become affiliated with the marketing organization, which is in turn affiliated wth the state organzation operating the large terminal elevators at Oakland.

The incorporating directors of the exchange are C.D. Barbour, Lemoore, who is also the temporary chairman; F. A. Jackson, Lemoore; F. W. James, Lemoore; J. W. Arthur, Hardwick; M. D. Baihley, Corcoran; Chas. R. Putz, Laton; J. A. Romine, temporary secretary, Hanford; J. P. Lemon, Hanford; J. W. Jenkins, Hanford; H. A. Crane, Hanford; W. I. Tibbs, Hanford.

The membership cost is $50 each and an intensive campaign is being started to secure at least ten members in each of the 11 farm bureau centers of the county. The membership fee is payable $20 cash and the balance a one-day note, which is to be used by the organization as collateral.

GARDEN GUIDE

Payne's Garden Guide for 1921, also list and prices of seeds, plants and trees, contains much of information, including planting and working calendar, seeding table, and other matter of value in addition to catalogue. One of the largest illustrations shows California wild garden scene taken in Exposition Park, Los Angeles, some three years ago. This wild garden should be continued as a part of Exposition Park every year.

San Bernardino—Redlands District

Where Is the "Deficit"?

"No appropriation should be considered where the need is not urgent."
—Message of Governor Stephens to the 1917 Legislature.

The people voted, in November, additional State costs totaling $18,000,000.

Governor Stephens in his message to the 1921 legislature declares:

". . . it is because of this voluntary action of the people themselves that the financial difficulties referred to have arisen."

Let Us Consider the Facts

State officials estimate our income for the next two years at **$67,000,000**

Charge up against this the 1919-1921 budget, which was **$47,000,000,** and add the **$18,000,000** voted by the people for the next two years. The total is..... **65,000,000**

We still would have left in our treasury ..... **$ 2,000,000**

Two Million dollars left, after paying every cent the people of California ever voted to pay. Two Million dollars left, after paying for every State expense at the rate we had to pay when costs were higher than they will be again for many years.

Two Million dollars left, after re-appropriating in full for the vast burden of "unnecessary duplications and unnecessary waste" which Governor Stephens admits now exists in the State government.

Two Million dollars left, after we Californians spend for our State government twice as much as the average citizen of other states.

Who Wants This Money?

Yet Governor Stephens declares "it is because of the voluntary action of the people themselves that the financial difficulties referred to have arisen."

Governor Stephens goes further. He goes $15,000,000 further.

After we have paid every dollar that we paid in 1919-21, and after we have paid every dollar we voted to pay at the November elections—after we have provided a surplus of $2,000,000 for emergencies, Governor Stephens calls for $15,000,000 more.

Other states are economizing. Illinois in one year has reduced her governmental costs $2,500,000.

Yet California State officials call upon the people for $15,000,000 above all amounts previously spent or now authorized.

Already California is spending vastly more than her sister states which are now reducing their budgets. The per capita government costs for actual running expenses (as distinct from interest and new investments) are shown by the 1919 U. S. census report to be as follows:

Average for all states,	$5.16
Illinois,	3.[illegible]
CALIFORNIA,	7.76

These Things Are True

The people have created no deficit, and there is no deficit.

The extra $15,000,000 now demanded by state officials is over and above all appropriations ever made in the past and all new expenses authorized by the people. No increase of any tax rate is necessary.

Ask your legislator to demand that the state live within its income.

California Mortgage Lifters

The dairy cow is coming back to many California communities — and with her return is coming assured prosperity. Other special crops have come in and swept some communities off their feet and those crops have been planted to exclusion of the dairy industry. Soil fertility was depleted, the special crops which at first proved extremely profitable ultimately proved disappointing. All of this proves the fact realized for many years that nothing is more dependable in the long run than animal husbandry.

SPRYWHEEL

The $150 Tractor—Crating and Freight Extra

"Multiplies Man Power by Five from Seedtime to Harvest"

**"I Wouldn't—
Like to Think of Farming Without Sprywheel"**

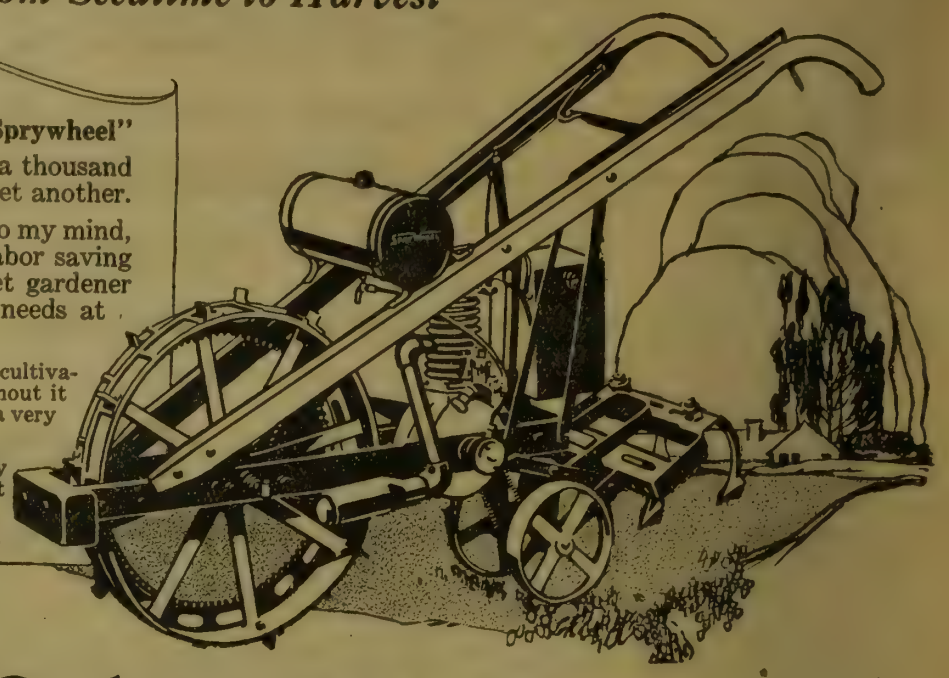
"I wouldn't let my Sprywheel go for a thousand dollars unless I knew where I could get another.

"The big point about the Sprywheel, to my mind, is not merely its very remarkable labor saving qualities; it is the fact that a market gardener cannot get the amount of labor he needs at any price today.

"With the Sprywheel, he can keep his crops cultivated and get the maximum yield, when without it he would either lose his crop entirely or get a very much smaller yield.

"This has been my experience and I certainly would not like to think of farming without Sprywheel."

P. T Hurley, Belmont, Mass.



How to Cut Cultivating Costs Below Pre-War Standards

Every gardener and farmer wishes to cut the money cost and the labor cost of raising crops. He wants maximum yield and early, full maturity. This requires thorough cultivation—cultivation at frequent intervals and almost up to maturity.

Late cultivation—after the plants have grown tall or spread into the rows—is extremely profitable. It has always required a lot of hand labor. This labor is hard to get when you need it—and it is ruinously expensive.

Sprywheel cuts the cost of both early and late cultivating. While the plants are small a two or three row attachment is used. When plants have grown larger, Sprywheel goes between the rows. It cultivates the narrowest or the widest rows. It will do any work that a hand hoe or a wheel hoe is used for—and will do it *five times as fast.*

That is how gardeners and farmers who use the Sprywheel cut down the money cost and the labor cost of raising crops and secure maximum yield and early maturity. It is just as necessary for cultivating crops as horses and tractors are for doing the heavy work.

What a Sprywheel and one gallon of gasoline will do

One gallon of gasoline runs a Sprywheel all day. It enables one man to cultivate fifteen miles of growing corn, cotton, peanuts, potatoes, tobacco, cabbage, celery, seedlings or small fruits—and to cultivate them thoroughly.

It multiplies man power by five—makes it possible for one man to do more hoeing, weeding and hilling than any five men pushing wheel hoes or using hand hoes.

Quickly converted into a power lawn mower

Besides tools for weeding, hoeing and hilling, there is the *Sprywheel Lawn Mower Attachment.* It can be attached in five minutes. Converts Sprywheel into a power lawn mower. Enables the home gardener to handle a good sized garden and keep the lawns presentable at the lowest cost for labor, time and money.

Sold by authorized Sprywheel dealers

Sprywheel is sold by authorized Sprywheel dealers who are granted exclusive territory. Write to-day for a Sprywheel catalog and the name of the nearest Sprywheel dealer.

Vol. LVI, No. 9 | Los Angeles, February 26, 1921 | One Dollar Yearly

"How Are Cattle Selling?"

By C. L. Hughes

The writer of this article is generally regarded as having more accurate information relating to the purebred cattle market in California than any other man. During the past four years he has sold more than $1,500,000 worth of cattle.—Editor.

SO MANY readers of the Cultivator have asked the above question of the writer, and are still asking it, that it appears the question is one of great present interest. However, that does not appear to be the real question in most cases, for it is usually followed by "How do you think the market will be this year?"

Prophesying is dangerous, even foolish generally, but there is perhaps much in the present livestock situation in California that can be quite accurately forecast by a study of conditions in the immediate past and in the present.

In considering the demand for and probable price levels for dairy cattle within the balance of this year there are present a number of influences that will most certainly affect the market. Let us consider first the grade dairy cow situation. During the war thousands of dairymen went out of business, and remember this—a very large number of their cattle went to the butcher. Their lands were turned over to the production of agricultural war babies, such as wheat, cotton, beans, rice, and much of the alfalfa that was grown was sold as hay, rather than fed on the farm to cattle.

Imperial Valley saw the conversion of most of her alfalfa fields into cotton fields.

Prohibition converted many of the alfalfa fields of the San Joaquin Valley into vineyards.

Beans and wheat and barley displaced the dairy cow on many farms in the San Joaquin.

In the Sacramento Valley raw land that would normally have been developed for alfalfa production was planted to rice.

Salt River Valley, Arizona, went cotton mad and practically depleted its dairy cow population that once numbered upwards of 60,000.

Necessity made business men out of some dairymen, and thousands of boarder cows went to the butcher under the stress of war time costs of production.

Such were the influences that worked through several years to reduce the number of dairy cows throughout this state and Arizona. But now the tide has turned.

Imperial Valley is going back to cows. The alfalfa is growing and dairy cows will start flowing into the valley within the next 60 days, if they can find them.

The vineyards of the San Joaquin will withstand the onslaught of milk, and the dairy cow will not yet return to the fields that so profitably produce the wherewith to make wine.

In the upper San Joaquin the dairy cow has already returned to many of the farms that cast her out a few years back, and still many others are nearly ready to welcome her.

In the Sacramento Valley the rice headache is giving way to the clear-headed decision that after all livestock farming is the permanent agriculture.

In the Salt River Valley, Arizona, the bankers have added their ultimatum to a case already decided—Salt River Valley must go back to dairy cows.

Add to the above the fact that a number of the large alfalfa producing sections of Nevada and Idaho are under quarantine, that no hay can be shipped out, and that cattle must be secured to consume it, and you have a brief outline of the dairy cow situation as it exists today.

It is true that the price of butter fat has reached a level that is alarming to many dairymen, but it is also true that feeds are reaching low levels and that the butter situation at present is absolutely abnormal, due in large measure to conditions in the condensed milk industry which have temporarily thrown most of our milk through the separator. This condition is apparently near to solution, and once condensing is under way in any considerable volume the fact seems certain to be reflected in a firmer butter market.

Conditions for the operation of dairy farms have certainly improved to a great extent during the past year, and this fact, in connection with some of the factors mentioned above, accounts for the present very large demand for the better sorts of grade dairy cows. As one of the evidences of this demand I might mention the fact that while my activities have very largely to do with registered cattle, yet within a space of two weeks during the month of January inquiries for a total of more than 700 head of grade Holstein dairy cows reached my desk.

Now as to the conditions affecting purebred registered dairy cattle: There never was a time when the outlook was as promising for the immediate future in California as at present, in my opinion. Not a few of the men who have directed inquiries for grade Holstein cows to me have also inquired as to an opinion on the advisability of buying purebreds instead of grades at this time. The answer to that question of course varies with individual cases, for there are many who should handle grades for a time at least for many differing reasons, but on the whole there are many men who can properly add at least a few purebreds, and others who can sensibly buy purebreds entirely.

The market for purebred dairy cattle will never reach the point of saturation until every dairy animal on every farm is a registered purebred, and then there will be the unlimited market for improved animals that will endure as long as dairy cattle exist, so that the capacity of our market may be classed as unlimited at the present time. Out of over 500,000 dairy cattle in California, only a little over 8000 are registered Holsteins, a comparison that gives something of an idea of the limits of our market for registered breeding animals within the borders of this one state, to say nothing of the very substantial foreign business that is right here today, and ours to expand if we do the things that are demanded in order to hold this trade.

Nor should we expect any lowering of the price levels for purebred registered dairy cattle, for, speaking for California, we have never at any time had an inflation in values, and there is no doubt but that the normal price levels that have prevailed in this state, coupled with the high class regulations under which cattle have been sold in public sales, have in a very large measure been responsible for the present stable and sound condition of the purebred breeding business, and this feature of stability is one of the greatest factors in influencing new men toward the breeding business, for no sensible man wants to invest his time or money in any business that is built upon an unstable foundation if he knows it.

Present prices of butter should have absolutely no influence on the price of registered dairy cattle, for any man who couples up the price per pound of butter today with the price of a good registered cow today has manifestly not the qualities of mind that the successful breeder must have. The breeding of purebreds is a permanent thing, one that has never failed to be profitable over a period of years if the breeder uses the sound sense and business acumen that he would have to use to be successful in any line of business.

The work of cow testing associations, the California State Dairy Cow Competition, and other movements of like objective, are gradually showing dairymen the difference between the good, profitable cow and the poor, boarder cow. As improvement in production can come only through the consistent use of purebred bulls, the market for better dairy bulls is being constantly widened, and this market is reflected in the demand for better breeding animals necessary to produce such bulls. Right here is another factor that every breeder must take into consideration today that the buying public for registered cattle is better informed today than ever before, is therefore more critical and, with the gradually increasing numbers of registered dairy cattle offered through the public sale, has the opportunity for more critical selection. Thus it has come about that the better sorts of registered dairy cattle are finding an increasing number of buyers at prices that are on the upgrade, while the contenders for the commoner cattle are not increasing in the same proportion, and prices are on the downgrade. Anyone who has carefully analyzed the public sales of dairy cattle in California during the past year has certainly been impressed with the great necessity for every breeder to constantly improve his herd if he expects the buying public to appraise his cattle at substantial values.

The recent tightness of money has been possibly the only factor that has kept the prices of registered dairy cattle from reaching new high levels in California, but this has been very largely offset by the liberal terms of payment made by most breeders who have been selling cattle to buyers worthy of credit, and it is a matter of record that this credit has been used only in a limited way, a very large percentage of transactions having been made on a strictly cash basis.

Taking all of these things into consideration, there seems no reason to expect any decline in prices for registered dairy cattle in California, and

(Continued on Page 289.)

A Sound Business

The demand for registered beef cattle either Shorthorns, Herefords or Angus, is constantly widening in this state with the growing knowledge of the worth of good blood.

Agricultural News Notes of the Pacific Coast

Northern California

Dates for the state fair at Sacramento have been set as September 3-11.

California has shipped 12 million dozen eggs to Eastern markets this season.

J. B. Hammon has been appointed assistant farm advisor of Alameda County.

A viticultural department was organized by the Sonoma County farm bureau last week.

Alameda County beekeepers met at Oakland and discussed small farm production of honey.

Hop growers of the Sacramento Valley are forming an association to handle the 1921 crop.

The Glenn County farm bureau is organizing a farmers' mutual fire insurance company.

Tehama County grain growers will erect two large grain elevators, one of them at Red Bluff.

Boundaries are being established for the Snake River drainage district near Gridley, Butte County.

Some of Lake County's larger pear orchards are being subdivided to make homes for small farmers.

Members of the Marin County farm bureau have signed up 11,000 sacks of potatoes in a potato pool.

Colusa County rice growers have joined the state wide rice pool planned by the Pacific Rice Growers.

The Rescue farm center of El Dorado County has organized a bull association, selecting an Ayrshire.

Mendocino County farm bureau has organized a marketing department with Mr. Moffitt as managing director.

The Tucker farm center of Napa County dedicated its center hall on January 15. There was an attendance of 300.

A Holstein and a Jersey purebred calf club are organized in the membership of the Glenn County farm bureau.

Sacramento Valley rice growers are charging millers with demoralizing the rice market and causing the loss of a million and a half dollars.

The Knightsen center of the Contra Costa County farm bureau is planning to build a center hall. Some funds have already been collected.

The purple vetch department of the Humboldt County farm bureau has signed up 2500 acres and this is being planted as rapidly as weather conditions permit.

The office of the state market director has been holding meetings among tomato growers with the aim of forming a cooperative marketing association for the state.

The Pacific Rice Growers Association has filed complaint against the California Rice Milling Company, charging sale of 20,000 sacks of rice contrary to instructions.

The Alvarado center of the Alameda County farm bureau has ordered three tons of certified seed potatoes. Part of this will be used in test plots to determine suitability to local conditions.

Saratoga blossom festival committee is planning for larger program than ever. The principal feature this year will be giant chorus which is now rehearsing. The festival will be held in March, exact date not yet chosen.

Central California

Stanislaus County is pushing the anti-Japanese crusade.

San Joaquin County farmers are to hold big rabbit drive, February 22.

A considerable acreage is being planted to grapes in the Inyo-Kern Valley.

Grain elevators are to be constructed at several points in Stanislaus County.

The Stanislaus County farm bureau has appointed W. J. Norton secretary-manager.

The Tulare County Poultry Association handled a total January business of $20,447.25.

A model septic tank was exhibited at all farm center meetings in Kings County during January.

Five hundred acres on the big Tagus ranch north of Tulare is to be planted to fruit, mostly peaches.

Fresno irrigation district recently voted $1,750,000 worth of bonds, the majority being 20 to one.

County highways have been accepted near Fowler and Reedley, Fresno County, of a total of 20 miles.

Resolutions endorsing the Raisin Association were passed by the Kings County farm bureau directors.

A Shafter, Kern County, rice grower reports production of 41 sacks per acre on a ten acre tract previously in alfalfa.

Farm home department meetings will be held in Kern County at Kern Delta, March 1; Wasco, 3; Edison-Fairfax, 4.

Eight counties of the San Joaquin Valley are planning to pool efforts in a great advertising campaign of the Valley.

The Lockwood center of the Monterey County farm bureau is planning erection of a grain elevator at San Lucas or Kings City.

Sales managers for the Peach Growers predict lower average price for dried peaches than has obtained during the past two years.

California apples shipped by all water route via Panama arrived in best of condition and at materially less cost for transportation.

Turlock, Stanislaus County, recently shipped out its first carload of cotton to gin at Fresno. Several more carloads will soon be ready.

The cooperative creamery association of Riverside, Fresno County, recently met in annual session, heard reports and elected directors for the coming year.

Retrial of Tulare irrigation district vs. Lindsay-Strathmore irrigation district water suit involving pumping of water from the Kaweah river delta begins in March.

Stanislaus County rice growers were recently addressed by President Quatman of the Glenn County Rice Growers Association on the pooling contract for the 1921 crop.

Five hundred head of Tulare County bred Duroc-Jerseys were recently purchased for shipment to the Hawaiian Islands. They were shipped from Los Angeles harbor, February 21.

Twenty boys and girls of the Prairie Center of the Tulare County farm burea have started on a pig raising contest; there are 17 members in the pig feeding club of the Burton-Westfield Center.

Souhern California

Almond blossoms are a glorious sight at Banning.

Farm center meeting at Burbank, Los Angeles County, February 28.

A farm bureau center is planned for Yucaipa, San Bernardino County.

Two more days of the National Orange Show at San Bernardino.

Beet planting is going on in the Smeltzer district of Orange County.

Imperial has been selected as the site for Imperial County fair grounds.

Orange County's citrus fruit shipments for 1920 totalled about $16,000,000.

A poultry department is being organized in the Los Angeles County farm bureau.

Imperial Valley has shipped 1,600 cars of lettuce to date, fully one-half of the total crop.

The first ripe cantaloupe of the season was brought into Brawley. Imperial County, February 8.

The Mutual Orange Association of Yorba Linda, Orange County, is completing a new packing house.

The Santa Barbara Walnut Growers Association is installing a vacuum cleaner in the main warehouse.

Apple Valley, San Bernardino County, has been euthusiastic in the county farm bureau membership drive.

There is proposal in San Diego to construct a dam on the site of the Old Mission dam of the Spanish fathers.

Hundreds of acres of cotton will be volunteered in the Blythe district of Riverside County, according to A. M. Douglas.

The citrus experiment station has on display at the National Orange Show at San Bernardino 350 varieties of citrus fruits.

More than 150 attended the first quarterly all-day meeting of the Walnut-Spadra-Pomona center of the Los Angeles County farm bureau.

Victor Valley land owners will fight against water appropriation there of San Bernardino and Pasadena. The latter city has filed on 5,000 inches.

The Southern California Fair at Riverside will run through nine days, opening October 8, closing October 16. W. W. Van Pelt was chosen secretary.

To protect citrus by-products an Orange County grower says a tariff of 15 cents a pound on citric acid and 30 cents a pound ad valorem duty on lemon oil is necessary.

The Tustin farm center of Orange County has started a movement to make fumigators, by terms of contract, responsible for damage done to citrus groves in which they operate.

Supervisors of Riverside County have approved a resolution presented by Kings County to the effect that every effort be put forth to retain in the state motor vehicle law that clause permitting supervisors to lighten loads in their respective counties.

County Horticultural Commissioner Call of Ventura County is planning a series of gopher control meetings with field demonstrations. Farm Adviser Staunton will cooperate in the work, and it is planned to have W. C. Jacobsen, superintendent of rodent control of the state department, present to advise.

The Coast and General

Arizona cattlemen met in state convention at Phoenix, February 8-10.

Farmers of Waitsburg, Washington, recently sold a pool of 25,000 bushels of wheat at $1.50.

Oregon is working for a tariff of four cents a pound on cherries in the emergency tariff bill.

More moisture is badly needed on ranges in southwestern New Mexico and southern Arizona.

A large shipment of hops has just gone from Chehalis, Washington, yards, to London buyers.

The Spokane poultry show recently held attracted breeders from Idaho and Oregon as well as Washington.

Arizona farm bureau is perfecting a state association and hopes to affiliate with the national farm bureau.

Dairymen of Lane County, Oregon, are increasing the capital stock of the cooperative creamery from $15,000 to $75,000.

The legislature of the state of Washington is endeavoring to simplify state administrative affairs so as to reduce taxes.

A National Bean Federation has been organized with headquarters at Lansing, Michigan. E. A. Little is temporary secretary.

Wheat growers of Oregon are organizing a cooperative marketing association on the plan followed by Washington and Idaho wheat men.

Vineyardists along southern shore of Lake Erie report prices received last year highest ever, some grapes commanding $200 per ton.

The Tillamook County Jersey Cattle Club, Oregon, is planning to join the Pacific Jersey Association. J. Donaldson is president of the club.

A bill has been introduced into the state legislature of Washington enabling the marketing of farm crops and the securing of rural credit.

Sixty-one cars of Yakima apples have been shipped during recent months to English and European ports by way of Seattle and the Panama.

The highway construction department of Arizona recently suspended highway construction and is now being flooded with telegrams asking resumption.

A group of settlers on the irrigated project at Burbank, Washington, have a commercial organization which meets every two weeks to discuss farmers' problems.

There were exported from the United States in 1920 26,841,772 dozen eggs. This is 12,000,000 less than the preceding year. Cuba received by far the largest share.

Four carloads of western Washington eggs were recently shipped from Seattle to New York City, constituting the largest single shipment so far made from that territory.

The reclamation service is to undertake the reclamation of the section in the Gila River above Florence. In the absence of satisfactory bids the work will be carried on by the service.

California has about 40,000 acres of pears, mostly Bartlett, Oregon, 13,212, and it is thought that within the next ten years the pear will be a larger shipper from the Pacific Coast than the apple.

THREAD-RUBBER INSULATION
STORAGE BATTERY
Willard

This trade-mark tells you that the plates in your battery are *insulated*—not merely *separated*. Willard Threaded Rubber Batteries are selected by the best brains in the automobile business as standard equipment for 175 makes of cars and trucks.

SEPARATORS Are One Thing INSULATION Is Another

Willard Threaded Rubber Insulation and the ordinary wood separator are as different in results as they are in appearance. Willard Threaded Rubber Insulation has no tendency to warp, carbonize, puncture or crack.

Threaded Rubber Insulation lives up to its name. It insulates—not merely separates the plates. Not affected by battery solution. It outlasts the battery plates every time.

It cuts out the expense of putting in new separators—gives you more miles of service per dollar. Ask the nearest Willard Dealer in your section about the Willard Threaded Rubber Battery—the only battery with Willard Threaded Rubber Insulation.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

Lemon men and their bookkeepers have been doing some figuring and serious thinking. Their figuring has shown an approximate cost for growing every box of lemons of $1.47; cost of picking and hauling to the packing house, 49 cents per box; cost of storing box, of packing and loading, $1.02; or a total cost of $2.98. (An investigation along similar lines, made in 1911, showed the cost $1.88). Selling charges and freight bring the price delivered to dealer in East to $4.50.

* * *

So much for the costs. When it comes to figuring up the net to the grower, "there ain't no sich thing." In fact, it has been determined that during the past year there has been an average loss of $1 on every box of lemons sold. The prices secured in the better markets have been running around $3.50, with occasionally $3.95 and again as low as four bits. This is not a temporary condition, for the lemon growers have been struggling with these difficulties for nearly three years now.

* * *

What are we going to do about it? Well, congress is talking and the lemon men are spitting on their hands and taking up the fight with railway commissions. The railway people have refused to grant an emergency rate.

* * *

As to the talk in congress, it finally did result in some action by the senate. Whether the amendments and changes will be accepted by the house may be known by the time these words are read, but action must be swift for this congress is pretty nearly dead.

* * *

Speaking of March 4 reminds that Attorney General Palmer's administration will be ended within the next seven days. Glory be! He certainly is endowed with the "stubborn gift that no philosophy can lift."

* * *

The names of the new cabinet are not all announced. Charles Evans Hughes, however, will be secretary of state, and we are reasonably assured that Mr. Meredith of Des Moines, Iowa, will be succeeded by Mr. Wallace of Des Moines, Iowa, in the department of agriculture. So far as semi-officially announced, other members of the cabinet are generally approved the country over.

* * *

The new president—and, by the way, the new vice-president, who gives promise of being a real man on a real man's job, but one which seldom had a fair chance—has one big job, not as big, however, as some of us feared a few weeks ago. We believe President Harding goes into office with a fund of good-will behind him which will mean much in restoring confidence.

* * *

The final session of the state legislature is now on, or will be before these words are read. It looks as if one of the greatest fights ever staged at Sacramento will be made on the King bill. The question as to who will pay the taxes for the support of the state is involved. That particular phase of the question is evaded by those who are opposed to the bill. Owners of farming lands have borne the burden of taxation so long that it is presumed that they must continue forever. And they will so continue unless they awake to the present situation and study this matter. Capital has taken the position that it must be guaranteed and that it must not carry the burden of taxation, or if it is carried, it is only temporary, for the state railway commission soon passes the burden on to the producer or to the consumer. This, it is said, must be from the laws of business—which has been too true, but how long can farmers continue to produce bread and butter on that basis? Perhaps forever, but we honestly think that capital should take a different attitude. The passage of the King bill will not settle the questions here raised by any means but it appeals to us that its defeat at this time would prove serious. There is more involved than appears on the surface.

* * *

Speaking of taxes, a popular topic of conversation at this moment, we are entirely safe in saying that there was never a time in the history of our country when there was such insistent demand for reduction. This demand has even gone so far as to call for a shortening up of the battleship building program. As an example of some of the ways in which tax money is spent we are now given a list of the items paid by the federal government to cover the cost of the president's peace mission to Paris. One of the items of that expense was for rent of the entire Hotel Crillon. This was $176,853. There must have been a case of rough house, for we note another item of expense was "damages to hotel property, $125,870." The American delegation were hearty eaters, for note the cost of food was $193,629; "wages of servants at hotel, $131,507"; "laundry bill American delegation, $64,969"; "kitchen supplies, $283,560"—this in addition to the cost of food noted above—"fuel, light and compressed air, $52,457"; "confidential expenses for president, $17,534.16." These are only a few of the items, for the entire bill as presented to congress totaled $1,435,567.16, to which is added "other expenses, $250,144.91." This liberal expense was doubtless in large part offset by the campaign of "thrift and buy a Victory Bond" conducted back in the states.

* * *

With the great need of California soils for more water and more fertility it is nothing more nor less than criminal for our greatest cities to pour literally millions of dollars into the ocean in the form of sewage. Yet today it is suggested in the city of Los Angeles that an additional expenditure of $12,000,000 or $13,000,000 be made in order to convey this wonderful wealth to everlasting loss in the Pacific Ocean and at the same time to the detriment of people living near the outlet. Modern science makes it possible to handle sewage, separating its fertile elements, and leaving the water almost as pure as when it fell upon the mountain tops. This water could then be used for irrigation in many of California's richest valleys.

DR. HUNT IN ROME

Californians have been gratified at the selection of Dean Thomas F. Hunt as American representative to the International Institute of Agriculture.

The appointment came during Dr. Hunt's stay in Europe during his sabbatical year. This has given him opportunity to gather and to give a fund of information regarding world conditions in production, supply and marketing.

Dr. Hunt writes us: "The first number of Part I of the Monthly Bulletin of Statistics of the International Institute of Agriculture is being sent. It is on prices and contains novel features." One of the principal features has to do with conversion of the figures having to do with quotations so as to make them intelligible to the farmer in every country, that is, quotations of dollars per bushel in New York mean little to the Frenchman, Italian or German, who wish their quotations in francs, lire or marks per quintal. Consideration is also given to differences in freight rates and to other questions affecting values to the producer. Regarding the work of the institute Dr. Hunt adds:

"In addition to publishing 36 bulletins a year in five languages, each month a summary of the statistics of production is sent by wire or wireless to the United States and other countries. Altogether it is a service that cannot be obtained elsewhere in the world and is at the disposal of all who read any one of the five languages, English, French, German, Italian or Spanish, couched in terms that anyone can understand."

AUTO LAW

The California Vehicle Act has been amended so many times, as improvements have come in automotive vehicles, that other amendments or, still better, substitution of one consistent act, seems to be best. Those connected with the auto industry are pushing for the passage of Assembly Bill 945 introduced by Assemblyman Lee of Pomona.

The effort has been made to incorporate in this bill everything, so far as possible, which has to do with the welfare of the industry and the safety of the traveling public. For instance, the age limit is to be raised to 18 years. At present a child of 16 is permitted to register and drive automobile or truck on the public highway. This suggestion has brought protests from some legislators because of the fact they set up that their son or neighbor's son of 15 or 16 can and does handle the auto as well as any man of mature years. This may be granted in many cases; again, a child of 16 may be entirely unfitted for driving an auto. Granted also that some adults have proven incapable of keeping their heads in a complicated situation, the fact remains that the 16 year old has not the judgment nor the perfect control of the machine which should be required of every driver. No railway company would for a moment trust a locomotive in the hands of one who had not had years of experience, and yet the locomotive engineer has a lesser responsibility than the driver of an auto on a crowded highway.

The present law also calls for examination of the qualifications of every man or woman who expects to take the machine on a public highway. Many tragedies have been caused by inefficiency that could have been prevented by reasonable examination at time of application for permit.

The bill provides for forfeiture of driver's license for violation of its provisions. There are also corrections in the amount of auto license fees on various standard vehicles, in general a slight reduction for lighter weight vehicles and material increase for auto busses, trucks and heavier passenger cars.

NOT WASTED

On the cover of the Cultivator for January 29 we used a beautiful illustration of a Tulare County irrigation canal and referred to the economy which should prevail in using our water. A subscriber takes exception. He writes:

"I have been a subscriber for nearly 20 years and am generally well pleased with the paper. However, I wish to call your attention to a gross misstatement in your issue of January 29, 1921, front page illustration and editorial on page 134. This water is not wasted.

"If all the ditches and streams coming out of the hills were cemented where would the water come from to supply our pumps, both for irrigation and domestic use?

"Our rainfall in the valley is only from six to eight inches, which doesn't penetrate the ground more than from two to four feet in ordinary seasons. Also none of the water of the smaller streams in the southern end of the San Joaquin Valley ever reaches San Francisco Bay, and it is only in exceptionally wet seasons that any water runs to waste from Kings River, the ditches taking it all as fast as the streams can supply it. I hope to see a correction of this matter in an early issue of your paper. You must have been misinformed by one of the water thieves."

All of which may be true, and we are glad to get our subscriber's viewpoint, but we cannot help but ask if it would not be more economical to save this water and conduct directly to the lands rather than allow it to percolate into the earth's lower strata only to be pumped back.

Who Will Pay Our State Taxes?

WE ARE all wonderfully proud of California. We have paid our taxes fairly willingly, though we have conceded they are far higher than in most other states of the Union. We have felt that our position out here at the front door of the nation, our wonderful scenic and climatic endowment, justified us in more liberal taxation and the more liberal advantages which the taxation gives. Note especially our good roads campaign—and notwithstanding experts to the contrary, California has some wonderfully fine roads. But this matter of taxation is one which, while we submit, as noted, fairly willingly, we are even more willing to pass on to the other fellow if we can.

On our editorial page last week we referred to the condition formerly existing, or rather to a case, possibly extreme, which showed wherein one large corporation failed to pay its just proportion of taxes. Things are somewhat different since the new plan of taxation by which corporations are released from county and municipal support and bear the burden of paying the money required by the state administration. The corporations now complain that a bill before the state legislature, known as the King tax bill, if passed, will work a hardship upon them; it means a material increase in the taxation on corporations over that of the past six years. Those of us who have had occasion to pay ad valorem taxes for county and municipal support likewise realize that we have had our taxes increased approximately 100 per cent. Perhaps not that much in rate, but considering increase in valuation and rate, that is about correct.

Touching upon this point the Fresno Republican says:

"We haven't got very far from the original situation—that there is a definite amount of state costs to be paid; that the legal method of paying them is to levy an assessment on certain corporations for their payment unless it shall be shown by reasonable figures that this would make the state rate exceed the county and city rate. This hasn't been shown yet. And the legislature has only until the first Monday in March, we believe, to settle the matter."

Farm bureaus and other farm organizations and the press of the state generally take the position that there is no injustice to the corporations in the provisions of the King bill, and the interest is so live in this question that we quote liberally from other papers in the hope that it may help to make the situation somewhat clearer.

But before touching the matter of costs or proportion, we think it well to consider the question from the standpoint of the state legislature as influenced by a lobby. As we said last week, a lobby may be entirely within its right and a valuable aid to more intelligent legislation, but California has had one upheaval in order to escape a lobby which was dominating rather than informing. We never want our legislation under control of such a lobby again. On this particular point another issue of the Fresno Republican suggests:

"If we are not to have a return to a situation such as we had prior to ten years ago, where it was the business of the corporations to go actively into state politics to guard their interests and to accomplish their purpose—if we are to preserve the state as the representative of all, and not of certain classes that have greater incentive to make 'use' of the state, then we must do two things: We must keep alive and vigorous the interest of all citizens in state affairs, whether they pay taxes to it or not; and we must see to it that no groups or persons, no special corporate interests, have either reason or opportunity to drive on the legislature, either to influence it or to own it. This is of much greater importance to us, as a commonwealth, than any question of whether 22 cents a hundred shall be added to our tax bills or be brought to us, in devious ways, through alterations in rates of light, power, water, gas, travel, insurance or banking facilities."

Corporation baiting is a popular exercise, but we believe the present campaign has been as free from that abuse as any recent campaign of this nature. So long as the people cannot, or at least do not, unite in cooperative control of many of our great public utilities, corporations are necessary. The advancement of California has been due to a large extent to far seeing and enterprising activities under control of great corporations, and there was never a time when plans so large in scope as to give a thrill in the very contemplation of them were under way as at present. The Colorado is to be harnessed and the waters of the Sierra Nevada are to give light and power to all parts of the state at a cost of hundreds of millions, and private capital is to be encouraged in the support of this and almost numberless other great movements. But such advancement must not be encouraged by granting unjust relief from taxation.

As to fair play between the great mass of us and the corporations the San Francisco Chronicle suggests:

"It is gratifying to notice that in the discussion of the King bill there is less and less denunciation of corporations as such and more effort to ascertain where exact justice lies. So long as practically all important business and a multitude of small mercantile concerns are incorporated, and doubtless four-fifths of the heads of families are part owners of corporate securities, to assume that 'corporations' are villainous is to assume that most of us are villains.

"We are not mostly villains and, moreover, if we were we should be smart enough, needing as we do hundreds of millions of new corporate money to be invested in this state, not to let the impression get out that if we can catch people investing money in this state we will soak them, because if investors do get that impression we shall not get any new money. There are plenty of places were new capital will be welcomed.

"We have corporations, especially some public service corporations, which are financially hard pressed. And there are multitudes of ad valorem taxpayers in the same fix. It is unfortunate that either have to pay increased taxes, but the people voted the money. And, on the other hand, there are both corporations and individuals who have been making a lot of money.

"We are convinced that upon the equities of the case this increase of taxation for state purposes should fall on the corporations, because we are sure that they now pay a rate much lower than that paid by the ad valorem taxpayers. Even had the corporations put their case in the hands of skillful men we are sure that the result would have been the same as that now obviously impending, for the facts are not with them but against them. But their propaganda has been really pathetic and excites some sympathy."

But we do believe there is possibility of tax reduction. We are rather liberally supplied with commissions. Here, again, however, there has been somewhat of injustice through thoughtless shouting: "Reduce the commissions." Some of California's greatest advancement has been made possible because of wise decisions of the railway and other commissions of this state. At the present moment the railway commission seems to be under fire and we will have to admit the increase in freight rates makes it look as if the commission has been exceptionally liberal with the railways. Most of our street car lines are still operating on the same compensation basis that they were five or ten years ago, but the railways have been given a freight increase of approximately 65 per cent. But that is another question and not directly involved in the present discussion. We still believe in possibilities for good in the railway commission.

But there are commissions or bureaus which look to us like duplication. For instance, an irrigation commission, a water commission, a forestry commission, a fish and game commission. Why not all these and others under one management such as the department of agriculture?

On this point we believe the legislature and the state administration are planning very definite changes which will mean much in economy, and we think that feature of the case will be settled entirely satisfactorily to the people.

Regarding the amount of money required, the Sacramento Bee says:

"At the November election the people voted to nearly double state aid to the public schools, and also for increased interest on state highway bonds, to enable them to be sold.

"Together, these measures, so made binding upon the state government, call for additional outlays of about $18,000,000 during the next two fiscal years. If in this period the corporations were to pay no higher rates of taxation than they have been paying for the past four years, the state treasury would be short of money to the extent of about $16,000,000, if the increased state aid to the schools and highways, called for by the people last November, were attempted to be given, and unless a state tax be levied on individual property owners to obtain that sum.

"And even if the King taxation bill, increasing the rates of taxation of public service and certain other corporations, be enacted, the total of the corporation taxes levied by the state in accordance therewith, during the two years specified, will fall somewhat short of the state budget requirements

"But let it be understood clearly that the measure in question aims to do nothing more than to make the rates of taxation to be paid by the railroads, gas, electric and other public service corporations, and by banks and insurance companies, for state purposes, as the constitution requires, proportionately equal to the rates now paid by individual property owners for city, county and district taxes.

"The rates fixed in the King bill are even a little less than those named by the state board of equalization, in its report to the governor, as commensurate with the local taxes paid by property owners in general, from which local taxes the corporations specified are constitutionally freed under our present system of taxation."

To sum up, the voters ruled that $18,000,000 additional should be expended. The state's best interests called for its advancement in growth which means advancement in cost of state government. We will not recede; we must proress. Who will pay for it, the farmer who is now overburdened or larger interests whose burden does not yet approach that of the farmer?

"Cut down taxes" is a fine phrase to conjure with. How in the deuce can we do it?

The Eleventh National Orange Show

THE National Orange Show is running true to form and encouraging a spell of weather. It can render no greater service, for the Southland is wanting just what it is getting, a supply of rain water.

The quality show on Washington Navel oranges is a great one, and for the first time in the history of the show three sweepstakes prizes go to one concern, the American Fruit Growers, winning first with 24 boxes Lindsay Navels, second and third on Highland and Rialto fruit. With lemons Upland growers take first in sweepstakes, while Riverside and Highland take second and third. East Highland grapefruit have proven high winners, with Lindsay and Riverside second and third.

It's a great quality show. Of course, the gate money is being swelled by spectacular features in addition to the large and fine commercial exhibit. The spectacular features were never better worked out than this year. One of the most educational exhibits, however, is that of the citrus experiment station at Riverside. It has literally hundreds of varieties of fruit, many of them of highest commercial importance; many others of no commercial importance whatever—a most educational exhibit. There is good music and plenty of vaudeville to keep up continuous interest on the part of the attendants.

ORANGE SHOW AWARDS

Class No. 1

24 Boxes Washington Navels — Sweepstakes: 1, American Fruit Growers, Lindsay, trophy and $100; 2, American Fruit Growers, East Highlands, $50; 3, American Fruit Growers, Rialto, $25.

Class No. 2

40 Boxes Artistic Display—Oranges: 1, Mutual Orange Distributors, Redlands, trophy and $50; 2, G. N. Hanson Fruit Company, Upland $25; 3, Upland Chamber of Commerce, $15.

Class No. 3

40 Boxes Artistic Display—Lemons: 1, American Fruit Growers, Los Angeles, trophy and $50; 2, Riverside Chamber of Commerce, $25; 3, Upland Chamber of Commerce, $15.

(Continued on Page 274.)

The Same Guaranteed Performance in the 12-20 OilPull

Into this, the smallest of the standardized line of Rumely OilPull tractors are built all the well known features of the largest sizes that for twelve years have established the Rumely tradition of quality, power, dependability and long life.

Oil Burning—Guaranteed to burn all grades of kerosene under all conditions and at all loads up to its full rated brake horsepower.

Oil Cooled—No overheating—no freezing—proper temperature of motor under all conditions for successful kerosene burning.

Two-Cylinder Motor—Low speed, heavy duty, horizontal, valve-in-head.

Enclosed Transmission—Cut steel, case-hardened, driving gears—transmission completely enclosed and running in oil.

Roller Bearings—Hyatt heavy-duty, anti-friction roller bearings in transmission and rear axle.

Two Speeds—Two forward speeds of 2.1 and 3.25 miles per hour.

Close Regulation—Governor controlled—speed of engine automatically adjusted to every change in load.

Perfect Lubrication—Combined fresh oil, force feed (Madison-Kipp) and splash system—constant lubrication to all parts.

Easy to Operate—Ratchet hand starter—low platform—all levers within easy reach—short turning.

Accessibility—All working parts easy of access.

All Around Usefulness—Handles all power jobs—equally efficient in drawbar or belt.

Large Capacity—Pulls three 14" moldboard plows under ordinary conditions—operates a 22x36-inch Ideal Thresher fully equipped.

The OilPull is also built in 16-30, 20-40 and 30-60 H. P. sizes.

There's a Rumely dealer in most towns—if not in yours, you can deal direct with us.

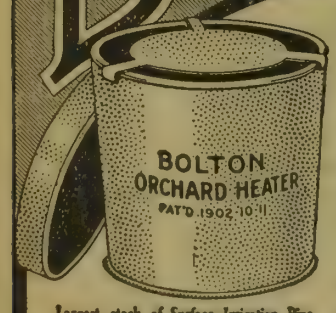
BOLTON ORCHARD HEATER



The U. S. Department of Agriculture estimates the annual loss by frost at $75,000,000. It may hit you next. The Bolton Orchard Heater

Prevents Frost Damage

Safest and surest frost prevention method known. Coal and wood heaters take too long to generate required heat. The Bolton beats Jack Frost to it, generates heat rapidly, maintains the temperature above the freezing point. This is important.

Send for Booklet B-2

Tells you all about frost prevention. Filled with valuable information for the grower.

FRESNO CALIFORNIA

When Writing Advertisers Mention California Cultivator.

Raisin Contract Campaign Progressing

Prominent bankers of the San Joaquin Valley have lately issued the astonishing statement that they have had no mortgage foreclosures since the establishment of the Associated Raisin Company. Among them stands O. J. Woodward, veteran banker and business man of Fresno for a long period of years. He said, "Every bank is a reflection of community prosperity. As far as my bank is concerned there has never been a foreclosure on a raisin vineyard since the California Associated Raisin Company was organized. The story of the old days of individual marketing and the hardships that went with those days cannot be told too often."

There can be but one answer to the tide of public opinion centered on this campaign for renewed contracts; the cause is right. A few packers and speculators still assume that they have the right to gamble upon the product of the farmer's labor, but the decisions are coming in daily by the hundreds against them. Meetings have been held and demonstrations staged in support of the new contract.

At Dinuba the other day 5000 people held a barbecue and pageant which depicted the change from the old "raisin fed hog" days to the congenial surroundings of the present time. The stores closed all day and the signing of contracts went on throughout the festival. Two hundred contracts were signed and turned into the main offices at Fresno one day last week. Japanese growers met and unanimously signed up for the association. Three thousand acres of bearing vinyard were signed up by L. R. Rogers and J. Blaine Rogers.

Seldom has there occurred so spontaneous a response to an appeal for the rights of the producer as has been in evidence throughout this campaign. No cause could receive such a unanimous support and not be just. Each day letters and testimonials come from growers who are sending in their contracts and pledging their fullest cooperation. Outside organizations are watching with the keenest of interest, for the cause of the California Associated Raisin Company is the cause of all growers' cooperative organizations—the right to market at a fair price that product for which they have expended both their strength and their money.

Many times before the formation of this company raisins were sold at a price under the cost of production; they have never sold under the cost of production since the association was organized. Much of the phenomenal success of the raisin association may be directly attributed to advertising, and the cumulative results of these national campaigns have served to create a demand in excess of the supply.

Spring Spray

All peach, almond and apricot trees should be sprayed with lime-sulphur as late as possible in the spring before the blossom buds burst into full bloom. The first spraying should have been done in the fall before the middle of December for peach blight and shot hole fungus control. Of the two sprayings the second or spring spraying is the more important and should not be omitted under any circumstances.

The commercial lime-sulphur is generally used.

Twig borers, curl leaf and pernicious scale or San Jose scale will be controlled by the spring application.

A power outfit is necessary for the best results as it is important that the liquid be forced into the rough places on the bark under a pressure of 150 to 200 pounds. The nozzle should be held close to the limbs in order that the full driving force of the spray may be realized. This is especially important when it is sought to control twig borers. These small grubs bore into the ends of the tender shoots, causing them to wilt and die; often the damage is serious, and when not killed outright, the young trees are left misshapen and injured. Later these grubs find their way into the fruit, causing the wormy peaches and almonds.

During the winter the larva or grub of the twig borer remains just under the bark in the crotches of the limbs and can be discovered by the frass or sawdust that is pushed out of the burrow. For about two weeks the larva is busy in its efforts to quit its winter quarters and finally emerges about the time the young leaves appear, when it bores into and destroys the shoots. The late spraying is timed to control this pest. It is equally important at this time to thoroughly coat all of the small limbs and branches for control of curl leaf on peach trees.

While late treatment is advised, growers must be governed by the weather conditions, size of orchard, capacity of pump and efficiency of equipment. If possible the work should be completed just as the trees are coming into bloom.

The curl leaf fungus causes the leaves of some varieties of peaches to curl and drop, weakening and injuring the crop and the tree itself. This fungus is easily controlled on most varieties but the liquid must be directed against the smaller branches and fine brush which must be well coated.

Lime-sulphur sprays are not recommended for brown apricot scale occurring in cherry, prune, apricot, plum and occasionally on peach trees; however, all deciduous trees are benefited by a thorough application of lime-sulphur, while the trees are dormant.

The attention of almond growers is particularly called to the importance of spraying this season with lime-sulphur as peach blight and twig borers often occasion severe losses in almond orchards.

Spraying followed by rain within 24 hours should be repeated.—H. P. Stabler.

ALFALFA FOR FERTILIZER

The National Orange Company has used alfalfa for fertilizer for a number of years, starting when it could be bought for $5 a ton, and the result has been so satisfactory that even at $25 a ton the alfalfa fertilizer is cheaper than stable manure. At present the company is grinding its alfalfa fertilizer, but Harry Chase of the National Orange Company states that a series of saws operated by power are being built by his company and the bales of alfalfa will be sent through saws and cut to fertilizer at a much less cost. Soon after spreading, plow, but alfalfa does not lose any of its properties by exposure. Stable manure as soon as it is spread begins to give off ammonia and this is a loss. The company plows to a depth of about four inches. Alfalfa will hold water longer than stable manure.

APRICOT SCALE

Prof. E. O. Essig of the college of agriculture is author of Circular 224, "Control of the Brown Apricot Scale and the Italian Pear Scale on Deciduous Fruit Trees." Prof. Essig says:

"The control of the brown apricot scale and the Italian pear scale has been so thoroughly worked out in practice that it seems advisable to make the information serviceable to many fruit growers who are not familiar with it. This can best be done by describing first the characteristics of the insects separately and then discussing the control measures for both together.

The circular gives full description of the brown apricot scale, then the pear scale, with results from the application of certain sprays. The time for spraying recommended is the period of dormancy between December 15 and February 15. In applying the spray the spray gun is preferred to the ordinary long rod.

Sprays

The sprays most effective in the control of these two scale insects are distillate emulsions, crude oil emulsions, and miscible oils. For the brown apricot scale alone, any of these, if properly prepared and ap-

The Burden of Proof Is on Our State Officials

The wealth of the State belongs to the people of the State. It is ours to give. It is ours to withhold.

State officials demand $81,000,000 of our money in the next two years.

This is $33,000,000 more than was authorized by the 1919 budget.

It is $15,000,000 more than the 1919 budget, plus all the money the people at the November elections authorized the administration to spend.

We are now told that the people must give this money to the administration or prove that the administration does not need it.

A Fair Proposition

Let us be reasonable. The people's money belongs to the people. It does not belong to the State office holders. Our present revenues are sufficient to cover a budget equal to that of 1919-21 with its war-time prices and $18,000,000 in additional expenditures for schools, dependent children and bond interest.

If State officials want more than this, if they are asking us to support State Boards that Governor Stephens admits should be abolished, and if they are asking us to spend money on other useless functions, we are entitled to know it.

Our Double Tax Burden

Already our per capita payment for State government each year, according to the U. S. Census Bureau report (1919) is	$11.24
The average per capita payment for State government throughout the United States (1919) is	6.05
The excess per capita cost for every Californian is	5.19

This is 89 per cent above the average State government cost, and now we are asked to load on our backs an additional $15,000,000.

Who Gets This Money?

We are told that the school teachers will get this money, but this is not true. They are already provided for in the amounts voted by the people at the November elections. We are told this money is for dependent children and bond interest, but this is not true. These sums we have already authorized. We are told that the people must prove that this additional money is not needed, but this is not true. The burden of proof is on the State office holders who are now asking $81,000,000 of the people's money to spend in the next two years.

These are the facts:

No Revenue Deficit Exists. No Ad Valorem Tax is Needed.

Ask your legislator to demand that the State live within its income.

Tax Investigation and Economy League

HERBERT W. CLARK, President W. V. HILL, Secretary

1504 Humboldt Bank Building, San Francisco

"The Power to Tax is the Power to Destroy"

plied, will give excellent results. The Italian pear scale, however, is more resistant and requires heavier and more numerous applications of distillate emulsions and miscible oils. This scale yields most readily to the crude oil emulsions, which are far superior to commercial lime-sulphur for this purpose.

Many growers realize the difficulty of securing proper materials for home made emulsions, as well as the variability of the home made mixtures even under the best conditions. They prefer to buy manufactured products, especially when only small quantities are needed. The commercial emulsions and miscible oils are no more effective than a good home made preparation and are only of interest as a matter of convenience. These preparations are on the market in great variety. Many are sold under trade names. Practically all grades of petroleum distillates, as well as crude petroleum, are obtainable in a form ready for use after simple dilution with water. If these ready made preparations are to be used, it is important to purchase only from reliable and well known manufacturers or dealers.

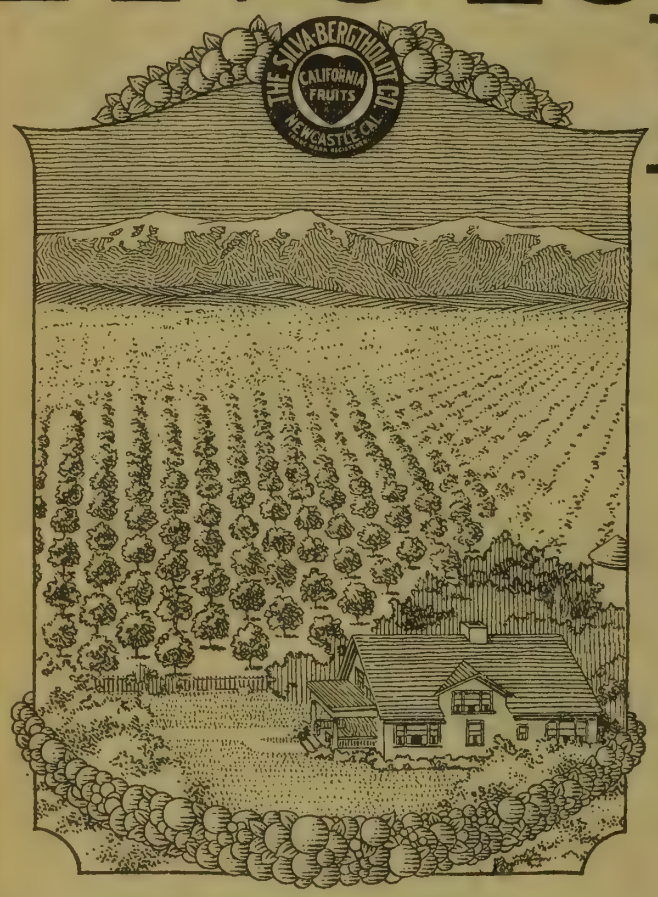
Five Years Hence



In another five years the present readjustment conditions will have been forgotten. Every dollar invested in trees today will be paying you dividends then.

Provide for the future by planting now.

Millions of acres of fertile lands now unprofitably employed in growing cereal crops will insure the future prosperity and happiness of their owners if planted to commercial orchards today.

PRUNES, PEARS, PLUMS, APPLES, CLINGSTONE PEACHES, FREESTONE PEACHES, CHERRIES, APRICOTS, ALMONDS, WALNUTS, GRAPES, OLIVES.

—all profitable according to their adaptability to your location.

Submit today a list of your tree wants for prices.

Catalog of useful Horticultural information mailed on application.

Nothing will add so much to your enjoyment as a well selected home orchard. Do it today.

Foot-hill grown trees are practically immune to crown-gall and diseases common to other localities. Roots, such as pictured above, are grown only on our foot-hill soil and location. They are tree insurance.

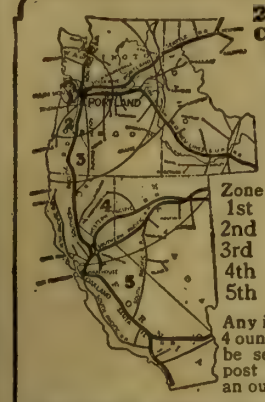
Satisfaction Guaranteed or Your Money Back

New Low Prices—YOUR Opportunity to Save

HERE are a few of the many money-saving offers presented by Montgomery Ward & Co. Every item is backed by our iron-clad guarantee of "Satisfaction or Your Money Back," coupled with the stability of 49 years of service rendered honestly. The new Main House at Portland means greater variety and rapid delivery of goods. We are anxious to have you test the merchandise and service from our new home. The offers on this page are typical of the thousands shown in our new 1921 Spring catalog. We are doing everything we can to help you cut the cost of living. Note the quality of the merchandise shown here—and see the remarkable prices! Compare these values with those offered elsewhere and figure your big saving. **Then Send Your Order Direct From This Ad.** You will be more than pleased with the goods. If you have a copy of our new catalog you will find many other items that will interest you—you will find new low prices on nearly everything you wear or use.

If you haven't received your copy write today for Buyer's Guide. But let us convince you NOW that we can save you money—**send your order from this ad!** TODAY!

How to Order From This Ad It's easy to order from this ad. Just clip out the **Entire Page and check the items you want sent to you.** Tell us the **number, size, color** and **amount** of merchandise wanted. Tell whether you want the items shipped by Parcel Post, Express or Freight. Enclose your personal check, draft or money order for amount of purchase allowing a small amount (usually 5c to 8c) for postage. See the map to the left for zone postal rates.



2200 Miles Closer to You

Here are the postal rates on territory served by the Portland house:

Zone	1st Lb.	Each Add. Lb.
1st	.05	.01
2nd	.05	.01
3rd	.06	.02
4th	.07	.04
5th	.08	.06

Any item weighing 4 ounces or less can be sent by parcel post for one cent an ounce.

Propagating Aphycus Lounsburyi

By Harold Compere

ONE of the simplest and cheapest methods of propagating the parasite Aphycus lounsburyi is by the use of black scale infested cuttings. This method was first used at the Sacramento insectary during the summer of 1918. At that time a generation of parasites was produced from mature black scale that were growing on olive twigs, the twigs having been made into cuttings and placed in moist sand. The scale infested twigs were taken from the orchard, cut to convenient lengths, the foliage trimmed away so as to prevent unnecessary evaporation, and the butt ends of the cuttings placed in trays of moist sand. The trays of cuttings were then placed in a cage and the scale exposed to the attack of a number of adult Aphycus. At the end of 30 days parasites began emerging from the scale. In the Sacramento district scale of the proper size could not be obtained after July so that these experiments in propagation were temporarily dropped.

Later at the Alhambra insectary this method of propagation was tried out again. In this second attempt pepper tree (Schinus molle) cuttings infested with black scale were used. For some unknown reason this attempt was a failure, all the scale drying up within a few weeks.

More recent attempts at this method of propagation have resulted in success. Citrus cuttings were obtained from a locality where the majority of the scale were of the proper size, namely, newly matured scale or scale of the third stage just before they commenced to oviposit. The citrus twigs bearing the scale were cut into 12 inch lengths, the foliage trimmed away, and the butt ends placed in moist sand. The trays of cuttings were placed in cages and the scale exposed to the attack of the parasites. Nearly all of the suitable scale were soon heavily parasitized. The Aphycus completed their development and began issuing as adults 30 days later.

The propagation of Aphycus by this method is only limited by the amount of suitable material that can be procured from the orchards. In the "even hatch" areas during April and May there is an unlimited quantity of scale of the proper size. This, however, is available at a time after the period when the most effective liberations are made in the interior districts. If this method of artificial propagation is used the most satisfactory material is that which supports quantities of third stage scale which are commencing to form eggs. All foliage should be pruned away so as to retard evaporation and prolong the life of the cutting. The insectary should be kept very humid and a temperature of 80 degrees be maintained. The cuttings should be well shaded and the sand frequently watered and never allowed to dry out.

Fresno Agricultural Society Meets

The regular monthly meeting of the Fresno Agricultural Society was held in the office of County Horticultural Comissioner Roullard on Tuesday evening, February 15. The members present enjoyed an unusual and rather rare treat in the form of a quantity of fresh grapes.

The discussion for the evening was led by Richard Schmidt, horticulturist of the Wylie M. Giffen Farms, and was on the subject of "Promising New Shipping Grapes and the Packing of Grapes in Sawdust." It happened that Mr. Schmidt had placed some of the sawdust packed grapes in cold storage on the 15th of October for experimental purposes and used this meeting of the society to show the results ogtained.

The three varieties which had been packed in this manner were the Emperor, Ohanez, or Almeria, and the Olivette de Vendemian. All of the grapes were in an excellent state of preservation, especially the Ohanez. A large part of the bunches of this variety were in perfect condition and even the stems were aparently as fresh as the day they were picked.

In the discussion of the subject it was brought out that there is an excellent future for the drum packing of grapes to be shipped to Eastern markets under ice for the holiday trade and perhaps for the months of spring and early sumer before the first new fruit reaches the market.

This fruit must of course compete with the Spanish Almeria grapes which have the whole Eastern market at that time, but it is felt that if we grow the same varieties or better ones we should be able to meet this competition.

Mr. Schmidt pointed out that investigations carried on between 1906 and 1911 indicated that under usual conditions of packing and storage the Ohanez would keep from 70 to 155 days with less than five per cent deterioration, the Emperor 80 to 120 days, and the Malaga from 50 to 80 days, so it is safe to assume that the Ohanez could be marketed as late as April 1, the Emperor up to the middle of January at least, and the Malaga could probably be held until the middle of December. It was pointed out that if the growers of California are to be successful in maintaining a good demand for the drum packed grapes, every care must be taken to insure only the very best quality of carefully culled clusters being packed. One of the principal causes of decay in the package is due to mechanical injury to the fruit from rough handling either in the field or in the packing house. If the picking of the fruit could be so regulated that very little handling would be necessary in the packing house it is felt that a great deal of spoilage could be eliminated.—F. K. H.

HARDY AVOCADO

Young avocado trees are more strikingly tender as compared with mature specimens than any other subtropical subjects the writer has observed. Living in a rather cold section, his avocado trees six feet high, of several named varieties, were well covered. Four posts were set and top and sides thatched with fan palm leaves, using about 25 leaves for each cover. In spite of this every variety except Fuerte was severely injured in the foliage.

Florida growers have noticed that young avocado trees which were growing vigorously when frosts came were less injured than those apparently nearly dormant. The same thing has been observed by the writer. This is quite opposed to the susceptibility of citrus trees. The latter are lowland tropical trees of pronounced hardiness for purely tropicals. The Guatemalan avocados come from high altitudes (6,000 to 8,000 feet), where frosts sometimes occur, although in a tropical land. This places them in the subtropical class. All the writer's avocados, except the Fuerte, stopped growing in the hottest weather of summer and grew no more during the year. Doubtless this was due to the fact that these trees are natives to cool uplands where hot, dry weather is never experienced.

Fuerte continued to grow throughout the summer, was growing vigorously when frosts came and still is growing. There must be something about the leaves functioning that makes them comparatively resistant to frost damage. It is an interesting phenomenon. As many of these varieties are quite hardy when of good size, it is evident that avocados become hardy in proportion to their age and growth. A score of seedlings of named varieties in the writer's garden, about a foot high, although well covered, were severely injured. The covering was more complete than that of the trees six feet high. Avocado trees are denuded of foliage and the wood severely sunburned in the hotter and dryer parts of California. Therefore

shade young trees with light cloth cover during summer, except in coastal sections, and with something decidedly more protective in cold sections during winter.—E. B.

THE HOME ORCHARD

In the afternoon of February 4 Farm Adviser Hodgson of Los Angeles County held a pruning and grafting (topworking) demonstration on the half-acre Jackson "ranchlet" at Athens-on-the-Hill, south of Los Angeles. Here was found one of every sort of citrus and subtropical fruit, deciduous trees, berries, currants, gooseberries, etc., a real home orchard and garden.

There is no type of planting where the farm advisor may do so much good for the individual orchardist as in these small home places. Commercial growers must of necessity know something of culture, varieties, etc., before venturing funds in the enterprise, but the home place, as in the one under consideration, is often planted by those who know little or nothing as to varieties, culture or general care. Poor varieties are common, in many fruits but unknown seedlings. Intelligent care is seldom given because the owner had previously been engaged in some line of business in the city and is making his first attempt in horticulture. Mr. Hodgson is paying short visits to many of the suburban ranchlets, pruning, grafting or budding one tree of each kind. Notices of these demonstrations are sent throughout the district and neighbors gather for instruction. It is a splendid missionary work that is destined to materially raise the standard of home products and yet be equally enlightening to commercial orchardists.

FERTILIZING ASPARAGUS

In a Massachusetts station bulletin a detailed account is given of a fertilizer experiment with asparagus that was conducted for a period of nine years on coarse sandy loam which was typical of the soils used for asparagus culture. Seven crops of young stalks were produced during the experiment, and the yield steadily increased each year until the sixth, which was the crop of maximum size on nearly every plat.

In commercial asparagus growing as usually carried on in Massachusetts it is a common practice to apply what appear to be excessive quantities of fertilizers. Applications of 460 pounds of nitrate of soda, 300 pounds of acid phosphate, and 260 pounds of muriate of potash per acre appear to be as large quantities of these elements as could be utilized by the crop. Nitrate of soda at the rate of about 400 pounds per acre in connection with manure at the rate of ten tons per acre increased the crop, and appears to be the maximum amount which proved beneficial. The application of either acid phosphate or muriate of potash with manure at the rate of ten tons per acre appears not to have increased the crop. Generally speaking, chemical fertilizers upon this sandy soil give as good results as manure.

As summarized, of the chemical fertilizers used a mixture of 466 pounds nitrate of soda, 300 pounds acid phosphate and 260 pounds muriate of potash per acre produced the best yields. Manure at the rate of ten tons per acre produced nearly as good results as the chemicals, while combinations of manure with chemicals and with nitrate of soda were no better than manure or chemicals used separately. When nitrate of soda was added to manure it was most efficient when applied in two portions, one in the spring and one in the summer Nitrate of soda applied with acid phosphate and muriate of potash was slightly more effective when applied in summer in four years out of seven. Muriate of potash proved to be the most satisfactory potash compound used. There was no apparent cumulative effect produced by the annual use of manure, and the asparagus tops harrowed into the soil each year seemed to supply sufficient organic matter for the efficient use of chemicals.

One of the features of the Maricopa County Agricultural and Horticultural exhibit at the 1920 Arizona state fair was the 59 varieties of vegetables and fruits grown on one city lot.

TEAGUE TREES

Ask the man who has planted them and he will tell you that Teague Trees are unequaled in growth and productiveness.

They are the best that can be produced.

If you intend planting CITRUS TREES it will pay you to come and see our stock and let us figure on your requirements while we still have a good assortment to select from, as the supply of good trees is limited.

Avocados, Feijoas and other Tropical fruit trees in all of the recommended varieties.

Send for our new descriptive price list and tell us what you intend to plant.

Thornless Blackberries

A subscriber at Klink, Tulare County, writes: "What has been the experience of Cultivator subscribers with the Thornless blackberries, both Burbank and Corey varieties? Are they to be depended upon as to bearing qualities?" This is a good suggestion and we hope to hear from berry growers.

Beefing the Cow

I have a cow 14 years old that I would like to fatten and sell this spring. She gives about five quarts of milk in the day. I milk her once a day. Please let me know when I am to dry her and how.

Milk for three days once in 24 hours, then every other day until you can get very little milk when let run for several days. If bag does not cake no bad results will come from not milking. Feed only on hay. As soon as the cow is "dried off" she should be placed on a ration which will lay on flesh, and if we are to get the top price for her that flesh must be of good quality. The following ration was used on a lot of "boarder" cows and the owner made a good profit on the increased weight and the half cent he received over the top market price when the cows were sold. These animals were fed for 30 days and sold for eight cents per pound, when the market was about seven and a half cents. They were fed as follows: Placed in a small outdoor run and taken off the alfalfa hay they had been receiving, a good grade of barley hay being substituted. Each cow received 10 pounds daily of barley hay and three pounds for every 1000 pounds (estimated) weight of the following mixture: 200 pounds cottonseed meal, 100 pounds rolled barley. Of course it will not pay to feed a cow that has come through her lactation period in good flesh on the above ration. It frequently happens that the poor milk producer puts on flesh during her milking period instead of putting milk in the pail for her owner. Such a cow should be sold as she stands. On the other hand a cow that is poor in flesh when she is dried off takes on flesh rapidly when changed from a milk to a fattening ration.

Of course a cow giving only five quarts in 24 hours—this is only about 10 pounds—is not paying for the food she is consuming, therefore the quicker disposed of the better, but such a cow might produce a quantity of milk sufficient to make her a paying investment if she received a properly balanced ration and was milked oftener than once in 24 hours. If the owner is convinced that he is getting the maximum of milk production from his cow and that the amount is below the cost of production the sooner he sells her to the butcher the better it will be for his bank account. Such a cow is not only a bill of expense to her owner but is causing an economic loss in the community in which she is kept by consuming feed that should be fed to a higher producing animal. A survey was made recently in a Southern California cow testing association, and in one case a very fine appearing cow, but a "boarder" of the first water, was traced through 17 dairies at a total cost in hay and grain consumed of over $3000.

Propagating Cane Berries

Please tell me the best way to propagate blackberries and raspberries. I have a few expensive plants, and want to set out a patch of berries from them.—Subscriber, Madera.

The reproduction of many of the cane fruits is through layering or planting of cane and placing tips and often entire cane underneath the soil. The tips will readily take root and a new vigorous plant may be secured. Most of these vines may also be reproduced by root cuttings. The reproduction is more satisfactory, where young and vigorous plants are used. Old and weakened plants are liable to give a young plant reduced vitality and vigor. The tips should not be covered by the earth until they begin to thicken and assume a leafless snake like appearance. This will be, say, at the end of July or August.

Killing Eucalyptus

Is there any time of the year that by cutting down eucalyptus trees it would kill the roots? If not, could you suggest something?—Subscriber, Lomita.

No, there is no such period with the eucalyptus. At least, we have cut them at all times of the year and they continue to sprout and grow after cutting in spring, summer, fall or winter. It has been claimed that if cut early in summer when full of sap and growing vigorously the shock is so great that they are more liable to die. The only way is either to grub out the larger roots or to cut, clear away the dirt from the stump, pile over brush and rubbish and burn. If this does not prevent growth, then grubbing out is the only remedy.

Eradicating Bermuda

I would like to know if there is any way of cleaning a place of Bermuda grass without picking it up by hand behind a plow or spring tooth, or allowing the ground to dry out. I have 20 acres and don't see how I can stand the pressure. There is an agent around here with a spray, $2.50 per gallon, which would cost me $700 to $1000 to use on this plan, and this being my first year I don't see how I can make it in returns with market prices as they are. What will coal oil, distillate or formaldehyde do to the grass and will they spoil the ground for production?—Subscriber, Artesia.

It is possible that coal oil or distillate sprayed on Bermuda on a very hot day might be beneficial. There are also proprietary sprays which are recommended. Then one may use strong solutions of sulphate of copper or take advantage of the poison or toxic acid of some of the arsenite sprays. Again, some in their desperation have applied common low grade salt an inch or more deep, which naturally has killed the soil for all crops for two or more years. All these chemical weed eradicators prove expensive, are not as satisfactory as one would wish and often are poisonous in effect on soil. The best cure for Bermuda or other pestiferous weeds is the plow and cultivator. Plant beans, beets, or other crop calling for clean culture, and one may rid the place of the weeds and make money doing it because the thorough culture demanded to keep the weeds or grass down will have such excellent effect on the cultivated crop that good production will result.

Woolly Aphis

A small "louse" that covers itself with a white "wool" ruined the fruit on a crabapple tree last year. It is now spreading on other apple trees and seems to make the small twigs knotty. Is this what is called the "white woolly aphis"? Can you tell me some good spray for the trees thus affected? Also, what is a good spray for a variety orchard and when should it be used?—Subscriber, Norwalk.

Presumably your guess is correct as to the woolly aphis. It is a most perplexing and destructive pest, not only infesting trunk and branches but you will probably also find it on roots near the surface. It is liable to cause large knots on branch and root and these enlargements prove serious handicaps to growth of tree. Subterranean or underground forms should be eradicated by liberal application of tobacco extract, which is made by steeping stems of tobacco leaves, or, more economical is the purchase of the commercial form known as nicotine sulphate. Full directions for use are given on the package. This is to be applied about the crown of the roots which have been excavated two or three feet out from the trunk of the

THE HARDIE MAUFACTURING CO.
224 No. Los Angeles Street Los Angeles, Cal.

tree. After spraying with the solution, cover. Then one may apply tanglefoot bands or any sticky solution around trunk of tree to prevent insects climbing up. Spray top of the tree at once or while the tree is dormant with nicotine sulphate, 40 per cent strength ¾ ounce, soap 4 ounces, water 4 gallons. Dissolve soap in hot or boiling water and add the nicotine. Where the pest is massed in rough places on trunks of trees, scrubbing with this soap tobacco mixture will more effectively remove the pest. The spray as given above is good for various forms of aphis. If infested with San Jose scale use lime-sulphur wash. Instructions on package used in putting up the commercial preparation give strength to use for different periods of the year. In the case of apples and pears of course various other sprays, usually containing arsenates, are used as the trees bloom and the young fruit grows, for codling moth.

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Estray Act

What is the procedure with respect to dealing with animals taken under the estray act?—Subscriber, Los Angeles.

The taker up of the estray must confine it in a secure place; within five days thereafter file with the recorder or pound keeper a notice containing description of the animal with marks and brands, if any; the probable value; and a statement of the place where found and where confined. For the filing of this notice there is a fee of 50 cents. If the animal exceeds $10 in value such notice must be published in a newspaper within the county at least once a week for three successive weeks, stating time the animal will be delivered to the constable. In case he knows the owner of the animal, within five days of the taking of the animal he must serve notice which shall contain the same information as the notice recorded and for which no charge shall be made Within 30 days from the filing of the above notice, if anyone appears and demands possession for the owner of the animal and pays to the taker up his lawful costs, the taker shall deliver the animal to the claimant. His costs are the fee for filing the notice, cost of publishing the notice, and attorney's fee for preparing the notice not to exceed $2.50. The law allows the sum of not to exceed $0.50 per day for the keeping and care of each horse, mule, jenny, or cow, bull, ox, steer, or calf, and the sum of not to exceed 15 cents per day for any other animal, provided, that the taker up must properly feed and water animals while in his care, and if he fails to do so, shall forfeit all lien thereto. If the claimant of the animal is dissatisfied with the amount for the care of the animal he must tender the amount he deems right and then take action for the recovery or possession of the animal from the taker up and the matter of expenses is thrashed out. Delivery cannot be made until the payment of the amount adjudged to be proper. If no person claims the animal within 30 days or if the claimant fails to pay the expenses or bring the action, then the taker up must notify the constable of the township in which the animal is held, which notice shall specify full compliance of the provisions of the act and that no claimant has appeared, or if such has appeared that he has failed to pay the expenses and costs and commence action and, further, that the animal is held subject to sale. The constable shall thereupon proceed to sell the animal at public sale in conformity to the law on execution sales, and shall be entitled to the same fees as on execution. Out of the money realized from the sale of the animal the constable shall first obtain his fees, then pay the taker up his expenses and costs, and the surplus, if any, he shall pay to the county treasurer to be held by him for the owner of the estray, if he shall appear in one year thereafter and prove to the satisfaction of the board of supervisors that he was the owner, in which case the board of supervisors shall order such sum to be paid over. If the owner does not so appear, the money is turned over to the county school fund of the county. Sale so made by the constable conveys good and valid title.

Trespass

I am taking care of a neighbor's place, who is now out of the state. Another neighbor has lately persisted in traveling over the place, which is unfenced, although there is a good road alongside. I have warned him to keep off, but he refuses to do so. What can be done?—Subscriber, Cudahy.

You may bring an action against such party for trespass, as ownership of the premises is not necessary for such action, but mere possession and the right to the immediate possession of the property.

Title to Land in Oil District

I am purchasing two lots from a bank. Near this point they are drilling for oil. I am informed that unless I purchase what is termed "surface right," I cannot prevent an oil company from drilling on my place nor can I get possession of the same. Is this true? What is a surface right?—Subscriber, Inglewood.

It is true that there are some grants of land wherein the mineral rights were reserved by the government. It is true that in some of the old Mexican grants the mineral rights were retained by the Mexican government and thereafter transferred to the government of the United States. Whether in any particular instance mineral rights have been released from the government of the United States, it will be necessary to ascertain the history of the title to the identical property. In the matter at hand, however, it is not necessary to make such investigation. You were purchasing from a bank, which is undoubtedly thoroughly responsible and would be responsible to you if they did not or could not convey the full and whole title to the property. Secondly, the placer mining laws are the only laws under which oil locations can be established. Now, in order to base a claim under the placer mining laws it is essential that a discovery of oil or mineral be made. A discovery of oil cannot be made, however, without drilling upon the land for the oil and actually finding oil under the land, but no one has the right to enter upon land without making actual proof that there is mineral or oil lying under the land. In other words, no one has the right to enter upon such land to explore the lands and see if there is oil there, as the burden of proof is upon the mineral claimant to show by a preponderance of testimony that the land is more valuable for mining than for any other purpose, not that it might possibly be able to develop minerals. The entry for the purpose of putting down the well would be a mere trespass, which could be prevented in the same way that any other trespass can be prevented.

Chrysanthemum Propagation

By Ernest Braunton

I HAVE some very fine chrysanthemums and would like to know just how to obtain slips from them. Should the slips be planted in their permanent place or is it better to transplant them later? Is it as well, as some do, to merely break up the clumps and set out the small pieces?—Subscriber, Crockett.

Professional chrysanthemum growers, nurserymen and gardeners grow each year from cuttings or slips; never do they depend upon division of old roots. The old roots have made their growth, matured, cured, and become hard and woody, therefore useless. The young plant should develop its own root system and never suffer a check from propagation to blossom. Any check resulting in hardening of the tissues prevents fullest possible development of the plant. Very good garden flowers may, however, be obtained from broken clumps if richly fed.

Time of propagation varies according to climate, conditions, soils, method of treatment and whims of gardeners—from January to April. But the latter half of March, in normal years, is the best two weeks of spring for propagating cuttings. Before that time it is best to keep old clumps from growing rankly and it matters little how much they are neglected so long as they do not perish. The best medium for rooting is a coarse washed sand. Fine sand usually carries some decaying matter which causes fungous growths and damping off. Fine sand should be washed out until it no longer colors the water very much. Propagating sand need carry no plant food for the latter is not needed and often defeats the ends striven for. In fact, plants root more readily in a sterilized medium; therefore wash the sand.

Some professionals propagate under glass, but none are more successful than those who have an ordinary lath house. Around this, from the level of the sand upward a yard wide strip of thin cheese cloth is placed, to prevent direct drafts of air across the plants, though freedom of air is imperative. The top is not covered but strong sunshine is never allowed to fall upon the cuttings. During the hotter hours of sunny days newspapers are used to cover the beds. On cloudy and rainy days no covering is used. Short pegs of wood or common plant labels are stuck in sand to prevent papers from lying heavily on cuttings, for on hot days the papers are sprinkled with a watering pot having a fine "rose" or perforated nozzle. Cuttings are also so sprinkled, but lightly and often. This outline should serve as a guide to the home propagator. Follow it as closely as your amateur equipment will allow.

Get a box six or more inches deep, bore many small holes through bottom to insure good drainage. Place on bottom an inch or two of small stones, very coarse gravel, broken flower pots, chinaware, etc., so rapid drainage of sand above is assured. On top of this place four inches of sand and soak it thoroughly with water. You are now ready for the cuttings. These latter should be terminal growths, tender and succulent, three inches long. They may be broken, by a quick movement, from the old clumps. Professionals usually cut them with a very sharp knife and keep the blade wiped clean. If knife is dull and ends of cuttings are pinched thereby they will rot rather than root. Plant them not more than two inches deep in sand by first making a slit or hole in sand. Never force any cuttings, even hard wood, into sand.

Usually a lath or similar straight edge is used, laid flat upon sand, a slit made in sand by an old table knife, big enough to allow placing of cuttings without forcing. Sand is pressed against first row, the lath laid against it and the second and subsequent rows treated likewise. The rows are the width of lath apart, the cuttings in rows one inch. The sand should be heavily watered at once, clear through, to firmly settle it about cuttings. Before placing in sand, if leaves are large, cut the tops or ends of them off so they will not droop in between cuttings; we must have all air and light possible. Cuttings are often made at night and stood in clean water until morning to soak full. This prevents wilt while handling or during the first day, the most important of all days. You may cover these boxes with glass or very thin, fine cheesecloth. Glass is best if you whitewash it to prevent sunburning of cuttings and slip a little wedge under the frame when temperature is high, but do not raise high enough to allow strong drafts. Keep boxes in sun and guard against sand becoming dry. In three to four weeks they will be rooted, and while you may then plant in permanent position, it is better either to pot, in three inch pots, and hold a month or transplant to boxes or positions where they have room for development and later transplant with small clumps of soil to garden. If treatment outlined, followed closely, does not bring good results we are powerless to aid you.

BEST TRACKLAYER SIXTY PULLING THREE GANGS OF STOCKTON PLOWS 10 INCHES DEEP

Tell Us How Much You Have to Plow

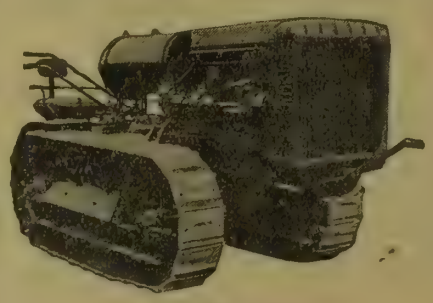
Whether you need a Best Tracklayer *Sixty* or a Best Tracklayer *Thirty*, depends upon the size of your farm and the nature of your work.

Give us the details and we will show you how you can use economically one of the famous Best Tracklayer Tractors for your plowing, cultivating, harvesting, hauling, etc.

There's no need to tell you of the many years of successful performance back of the Best line. There's no need to tell you of what the Best line—developed on the Pacific Coast—has done for the Pacific Coast farmer.

Interesting as this is, it is ancient history to you, What you want to know is "How can I adopt the Best way to my farming problems?"

That is the question we want to help answer for you. There's no better time than the present in which to put the Best Tracklayer to the test. Plowing time is here and plowing must be started at once and completed promptly. You need Best dependability and stamina and low operating cost, and you need a tractor that will go unimpeded over soft, loose or rough ground.



TRACKLAYER "THIRTY"

Let us tell you all about the points that have made Best Tracklayer reputation, and give you the name and address of our nearest dealer where you can see the Tracklayer. Now is the time.

BEST TRACKLAYER TRACTORS

USE LIGHT DISCOVERY TO AID PLANT GROWTH

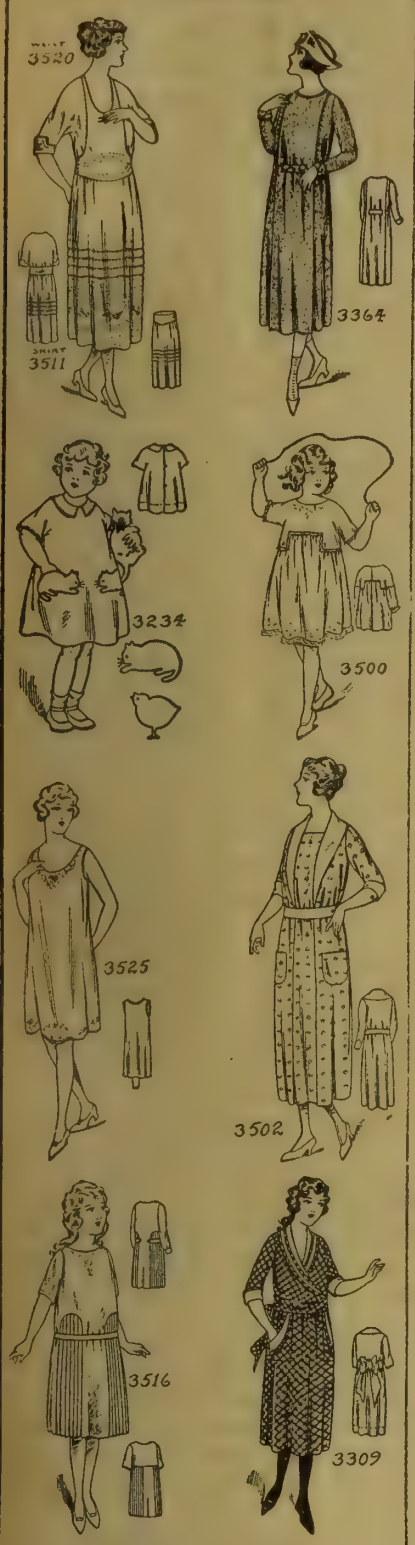
To get poinsettias ready for the market by Christmas is a problem that has worried florists ever since the bright red flowerlike leaves of this beautiful plant took their place as a favorite holiday decoration.

The problem has been reduced to a practical solution through the work of Dr. W. W. Garner, tobacco specialist, and H. H. Allard, plant physiologist of the United States department of agriculture, who discovered the possibility of advancing or retarding the growth of plants by controlling the period of light each day. Where the light period is shortened the plants reach maturity much sooner than when they are given the natural length of day. In the greenhouses on the department's experimental farm at Arlington, Virginia, it has been found possible to bring poinsettias into full form as early as August by shortening the daily exposure to lights.

In fact, department specialists are confident that there is practically no limit to the extent to which the Garner-Allard discovery may be applied in the ordinary florist establishment in bringing various flowers into bloom outside of the customary season. Iris in December and chrysanthemums in the spring are among the accomplishments already attained, and it is the intention of these specialists to bring together a group of flowers, all of different natural seasons, into bloom at the same time. One value of the discovery is that it may be easily applied with only simple and inexpensive additions to the facilities of any greenhouse.

At a time of crisis in the Civil War a politician telegraphed Horace Greeley, "Are there any news?" "Not a new," promptly wired back the great editor, who was a stickler for good English.

The Cultivator Patterns



BE SURE TO SEND SIZE

3520-3511, Ladies' Costume.—Waist 3520 cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3511 cut in 7 sizes: 24, 26, 28, 30, 32, 34 and 36 inches waist measure. To make this model for a medium size will require 6¼ yards of 36-inch material. The width of the skirt at the foot is about two yards. TWO separate patterns 10 cents FOR EACH pattern.

3234. A New Play Apron.—Cut in 5 sizes: 1, 2, 3, 4 and 5 years. A 4-year size will require 1½ yard of 36-inch material. Price 10 cents.

3525. Ladies' Envelope Chemise.—Cut in 4 sizes: Small, 32-34; Medium, 36-38; Large, 40-42, and Extra Large, 44-46 inches bust measure. A Medium size will require 2⅞ yards of 36-inch material. Price 10 cents.

3516. Girls' Dress.—Cut in 4 sizes: 8, 10, 12 and 14 years. A 12-year size will require 4½ yards of 40-inch material. Price 10 cents.

3364. A Youthful Style.—Cut in 3 sizes: 16, 18 and 20 years. Size 18 will require 5 yards of 27-inch material. This dress measures about 1¾ yard at the foot. Price 10 cents.

3500. Girls' Dress.—Cut in 4 sizes: 4, 6, 8 and 10 years. A 6-year size will require 2¾ yards of 36-inch material. Price 10 cents.

3502. Ladies' House Dress.—Cut in 7 sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. A 38-inch size will require 6¾ yards of 36-inch material. The width of the skkirt at the foot with plaits extended is about 2½ yards. Price 10 cents.

3309. Junior Dress.—Cut in 3 sizes: 12, 14 and 16 years. A 14-year size will require 5¼ yards of 27-inch material. Price 10 cents.

Household Department

McGuffey's Fifth Reader

In the issue of the California Cultivator of February 5 appeared from McGuffey's Eclectic Fifth Reader the old time poem read by "school boys and girls of other days," "Lord Ullin's Daughter," also Walter Scott's "The Tournament"; the next week, the "Last Sigh of the Moor" and a newspaper account (The Edinburgh Review) of "Impeachment of Warren Hastings." In the selections chosen for this week is given proof that California is not the originator of the "Boost Your Own State" slogan, for while California was still within the boundaries of Old Mexico, Hayne of South Carolina and Webster of Massachusetts gave their estimate of their own states in the federal congress. "Faithless Nelly Gray" will also prove a reminder of barefoot days a half a century ago.

Next week the household department will give place to a story written for Cultivator readers and the Eclectic Fifth Reader will be allowed to rest for a few weeks.

LESSON LVII

FAITHLESS NELLY GRAY

Ben Battle was a soldier bold,
And used to war's alarms;
But a cannon-ball took off his legs,
So he laid down his arms.

Now, as they bore him off the field,
Said he, "Let others shoot,
For here I leave my second leg
And the Forty-second foot."

The army surgeons made him limbs;
Said he, "They're only pegs,
But there's as wooden members quite
as represent my legs."

Now Ben, he loved a pretty maid,
Her name was Nelly Gray;
So he went to pay her his devoirs
When he'd devoured his pay.

But when he called on Nelly Gray,
She made him quite a scoff,
And when she saw his wooden legs,
Began to take them off.

"O, Nelly Gray! O, Nelly Gray!
Is this your love so warm?
The love that loves a scarlet coat
Should be more uniform."

Said she, "I loved a soldier once,
For he was blithe and brave;
But I will never have a man
With both legs in the grave.

"Before you had these timber toes,
Your love I did allow,
But then, you know, you stand upon
Another footing now."

"O, false and fickle Nelly Gray,
I know why you refuse:
Though I've no feet—some other man
Is standing in my shoes.

"I wish I ne'er had seen your face;
But, now, a long farewell!
For you will be my death;—alas!
You will not be my Nell!"

Now when he went from Nelly Gray
His heart so heavy got,
And life was such a burden grown,
It made him take a knot.

So, round his melancholy neck
A rope he did entwine,
And for the second time in life
Enlisted in the Line.

One end he tied around a beam
And then removed his pegs,
And, as his legs were off, of course,
He soon was off his legs.

And there he hung till he was dead
As any nail in town:
For though distress had cut him up,
It could not cut him down.

Hood.

LESSON LIII

South Carolina

IF there be one state in the Union, Mr. President, that may challenge comparison with any other, for a uniform, zealous, ardent and uncalculating devotion to the Union, that state is South Carolina. Sir, from the very commencement of the revolution, up to this hour, there is no sacrifice, however great, she has not cheerfully made; no service she has ever hesitated to perform.

2. She has adhered to you in your prosperity; but in your adversity, she has clung to you with more than filial affection. No matter what was the condition of her domestic affairs, though deprived of her resources, divided by parties, or surrounded by difficulties, the call of the country has been to her as the voice of God. Domestic discord ceased at the sound; every man became at once reconciled to his brethren, and the sons of Carolina were all seen, crowding together to the temple, bringing their gifts to the altar of their common country.

3. What, sir, was the conduct of the South, during the revolution? Sir, I honor New England for her conduct in that glorious struggle. But great as is the praise which belongs to her, I think at least equal honor is due to the South. Never was there exhibited, in the history of the world, higher examples of noble daring, dreadful suffering, and heroic endurance, than by the whigs of Carolina, during the revolution. The whole state, from the mountains to the sea, was overrun by an overwhelming force of the enemy. The fruits of industry perished on the spot where they were produced, or were consumed by the foe.

4. "The plains of Carolina" drank up the most precious blood of her citizens. Black, smoking ruins marked the places which had been the habitation of her children. Driven from their homes into the gloomy and almost impenetrable swamps, even there the spirit of liberty survived, and South Carolina, sustained by the example of her Sumpters, and her Marions, proved, by her conduct, that though her soil might be overrun, the spirit of her people was invincible.—Hayne.

LESSON LIV

Massachusetts and South Carolina

THE eulogium pronounced on the character of the state of South Carolina, by the honorable gentleman, for her revolutionary and other merits, meets my hearty concurrence. I shall not acknowledge that the honorable member goes before me, in regard for whatever of distinguished talent or distinguished character, South Carolina has produced. I claim part of the honor; I partake in the pride of her great names. I claim them for countrymen, one and all—the Laurenses, the Rutledges, the Pinckneys, the Sumpters, the Marions—Americans all—whose fame is no more to be hemmed in by state lines, than their talents and patriotism were capable of being circumscribed within the same narrow limits.

2. In their day and generation, they served and honored the country, and the whole country, and their renown is of the treasures of the whole country. Him, whose honored name the gentleman himself bears—does he suppose me less capable of gratitude for his patriotism, or sympathy for his suffering, than if his eyes had first opened upon the light in Massachusetts, instead of South Carolina! Sir, does he suppose it in his power to exhibit in Carolina a name so bright as to produce envy in my bosom? No, sir—increased gratification and delight rather. Sir, I thank God that, if I am gifted with little of the spirit which is said to be able to raise mortals to the skies, I have yet none, as I trust, of that other spirit, which would drag angels down.

3. When I shall be found, sir, in my place here in the senate, or elsewhere, to sneer at public merit, because it happened to spring up beyond the little limits of my own state or neighborhood; when I refuse for any such cause, or for any cause, the homage due to American talent, to elevated patriotism, to sincere devotion to liberty and the country; or if I see an uncommon endowment of heaven; if I see extraordinary capacity or virtue in any son of the South; and if, moved by local prejudice, or gangrened by state jealousy, I get up here to abate a tithe of a hair from his just character and just fame, may my tongue cleave to the roof of my mouth.

4. Mr. President, I shall enter on no encomium upon Massachusetts. She

The Miskin Tractor Scraper

This Is IT At Last

THE MISKIN TRACTOR SCRAPER
GUARANTEED TO MOVE TWICE AS MUCH DIRT AS ANY OTHER SCRAPER ON THE MARKET, WITH THE SAME HORSE POWER IN THE SAME LENGTH OF TIME.

The tractor carries the front, the scraper wheels carry the balance of the scraper, loaded or empty.

Easy to fill with the lever at the side of tractor driver's seat and easy to dump and spread with the rope. No stopping, nor backing up.

Made in four sizes, from one-half to one and one-fourth yard capacity. Most small tractors handle the yard size easily.

Sold with the same GUARANTEE of satisfaction or money refunded, that we have always given with our horse drawn scrapers for which we claim 100 per cent satisfaction.

Prices, terms and capacities the same as that of the horse-drawn scraper of the same size.

Ask about our horse-drawn scrapers if interested.

Write for circulars with prices, and names and locations of dealers.

needs none. There she is; behold her, and judge for yourselves. There is her history; the world knows it by heart. The past, at least, is secure. There is Boston, and Concord, and Lexington, and Bunker-hill; and there they will remain forever. And, sir, where American liberty raised its first voice, and where its youth was nurtured and sustained, there it still lives, in the strength of its manhood, and full of its original spirit. If discord and disunion shall wound it; if party strife and blind ambition shall hawk at and tear it; if folly and madness, if uneasiness under salutary restraint, shall succeed to separate it from that Union, by which alone its existence is made sure, it will stand, in the end, by the side of that cradle in which its infancy was rocked; it will stretch forth its arm with whatever of vigor it may still retain, over the friends who gathered around it; and it will fall at last, if fall it must, amid the proudest monuments of its glory, and on the very spot of its origin.—Webster.

HOUSEHOLD QUERIES

Nut Bread

Would like to have a recipe for a nut loaf, not a cake but more like bread.—Subscriber, Fullerton.

With Baking Powder: Two eggs, ½ cup sugar, 1 tablespoon melted butter, 1½ cups milk, 4 cups sifted flour, 4 teaspoons baking powder, salt to taste, 1 cup chopped nuts. Bake in loaf pan in moderate oven about 45 minuates.

With Yeast: One cup oatmeal or rolled oats, 2 cups boiling water, heaping tablespoon shortening, 1 cup sugar, teaspoon salt. When sufficiently cool add one cup soft yeast and mix enough to knead with wheat flour. Put into one or two loaves, let rise and bake until thoroughly done.

Homemade Fireless Cooker

The Cultivator is a paper that can't be beat. Now, will some one hurry and please tell me how to make a fireless cooker before the weather gets so hot?—Subscriber, Corning.

For the outside container a tightly built wooden box with hinged, tightly fitting cover is probably best. An old trunk could be used, a small barrel, or a large lard tin or a galvanized iron bucket, provided only it is tight and has a closely fitting cover and is large enough in comparison to kettle to be used to allow for at least four inches of packing material on all sides of kettle. The kettle used should have perpendicular sides, so that it can be fitted into its nest smoothly and should have flat tight fitting cover, preferably one that has deep inside rim, fitting well down into kettle to retain heat. One can purchase kettles made for this purpose which have clamps on tops. A six quart kettle is a convenient size. Tinned vessels should not be used as they are apt to rust from the confined moisture; enameled or aluminum vessels are satisfactory. A lining for the nest may be made of strong cardboard of a size to fit easily around kettle used. For packing and insulating material crumpled paper is very satisfactory. Crush single sheets of newspaper between hands, pack in closely, pounding in with heavy wooden stick, for at least four inches deep. Stand lining for nest in center of this layer and pack more crushed paper about it as solidly as possible to the top of the nest lining, and the outside box should lack about four inches of being filled. Make a pad of heavy cotton goods stuffed with crushed paper to solidly fill the box when cover is fastened down.

If one expects to use a heated stove lid or stone beneath the kettle, it will, of course, be necessary to have the nest lining made of metal and allow enough extra depth to take in the stone. A metal lining may be made by tinsmith or a galvanized iron or other metal bucket may be used. A heavy pad of asbestos should also be placed under the bottom of the nest and a sheet or two of asbestos paper placed between lining and packing material. Of course if non-inflammable packing material is used instead of the paper this will not be necessary. Asbestos or mineral wool make the best packing, or ground cork such as is used for packing Malaga grapes is good. Hay or excelsior are also used, but these are more odorous than the paper. Where one uses the inexpensive paper packing one feels quite free to change it as soon as it becomes soiled or smelly. This has been used by many housekeepers and found entirely satisfactory.

HINTS FROM HOUSEKEEPERS

Dampen Cloth With Brush

Being often benefited by items from readers of your paper, I wish to pass along a little convenience that I hit on quite recently. Perhaps some other housewife will be as pleased to benefit by it as I have been.

In pressing woolen goods, seams and so forth, where one has to use a wet cloth over the material and iron and press on that, I always disliked very much the constant dipping of the cloth into the water and wringing out with hands hot and swollen from ironing, and the time it took. It was not pleasant, to say the least. Finally one day it came to me to do this way, and I certainly am glad of the inspiration, as it takes all dislike of the task from me. I lay the cloth smoothly over whatever is to be pressed, then dipping a small brush in the pan of water I quickly dampen the cloth exactly as I want it dampened. If I am pressing seams only it is so easy to press the seams open just right, lay the cloth over and just run the dampened brush down the seam and press on dampened place.—Subscriber, Sherman.

Eat Olives

These suggestions were sent in by Mrs. Stainton for use in last week's Cultivator in honor of Olive Day, February 21, but as all available space in the paper was already filled we were obliged to hold over another week. However, those who have the ripe olive habit—which means practically every Californian—will just as gladly read today and pass on the information to others, for the whole year 1921 may well be celebrated as Olive Year.

* * *

Every home should have an olive tree if possible. One olive tree will supply enough for the average household for a year.

Olive Salad: Equal portions of well seasoned cottage cheese and chopped ripe olives served on lettuce hearts with French dressing is a favorite salad.

Olive Sandwiches: Remove the pits and cut up the olives in a food chopper with a medium cutter. Mix with a little Mayonnaise dressing and spread between thin slices of buttered bread.

Ripe olives chopped and added to any meat or vegetable salad make a delicious addition, a great improvement to a fish loaf, to the stuffing for eggs for the picnic, to creamed chicken, to stuffed tomatoes, and a wholesome addition to the children's lunch box.

Sure Cure for Corns

Take half a lemon and moisten the corn well with it night and morning, and it will soon dry up so you can pick it off.—Mrs, Chas. Cook, Hayward.

Good Way to Pick Ducks or Geese

A good way to pick ducks or geese is to take off while still warm all the feathers you can easily, then dip in boiling water and wrap in cloth for 20 minutes. The rest is easy.—Mrs. R. S. Vliex, Orange.

Four Helpful Hints

I have received help from other recipes printed in this department and I wish to send two which might be new to others.

Nut Cake—2 eggs, ½ cup Crisco, 1 cup brown sugar, ½ cup sour milk, ½ cup nut meats, 1½ cups flour, 1 teaspoon soda, 1 teaspoon vanilla. Put in a few raisins chopped with nuts and sift about one-half of the flour over them.

Plum Pudding—1 cup molasses, 1 cup sour milk, 1 cup chopped suet (fine), 1 cup chopped raisins, ⅛ cup currants, ½ cup almonds (blanched and pounded), 2½ cups flour, ½ teaspoon soda. Salt and season to taste with cinnamon and cloves. Steam three hours.

Milk Gravy—In cooking ham, a de-

licious gravy may be made by pouring rich milk over the ham when it is almost done. Let simmer with ham a few minutes and serve with mashed potatoes or hot biscuits.

Crisp Pie Crust—In making cream or lemon pie the crust may be prevented from becoming soaked by lightly brushing crust with beaten white of egg.—Mrs. Ralph W. Trowbridge, Orland.

YEAST AND LARD SUGGESTIONS

So many Cultivator housewives have responded to request for methods of making yeast starter and sweetening rancid lard that it is not possible to print all the suggestions received, so those that came first to this office are the ones published. We wish, however, to express our appreciation, and that of the inquirers, for the generous and valuable contributions received.

Dry Yeast for Potato Starter

Boil one-fourth package hops one hour, covered with pint and half water. As this boils away add water to keep up the pint and half. Strain while hot over flour, but do not make mixture too thick. When cool add yeast cake, either magic or yeast foam, dissolved in a little lukewarm water. Set in a warm place and when very light thicken with corn meal and roll out with rolling pin to one-fourth inch thickness, then cut with small baking powder lid into cakes. Dry until all moisture is gone. Place in paper bag or glass jar to keep dry, and use one cake as wanted for starter. If Mountain Subscriber cannot get hops and has peach leaves, dry them in season and store away for use.—Mrs. Ellen W. Flint, Kelseyville.

World's Fair Starter

Very good homemade yeast or starter, as no more yeast is used after getting it made. Boil 4 or 5 medium potatoes in water to cover. Strain this potato water through muslin or flour sack and add 2 tablespoons sugar. Let cool, then add 1 cake compressed yeast or 2 cakes magic yeast and let stand two or three days in warm place or till it foams up a little. Now your starter is ready, but it must be renewed before you use it, so stir well and pour out all but about a quart. If you wish to bake tomorrow, boil the potatoes as before, strain potato water, add sugar and cool, then pour in two quart jar with the starter set in warm place. In the morning stir up well and take out all but a scant pint, which is kept as your starter in a cool place till you want to bake again. What you have taken out this time is for your bread sponge. This is called the World's Fair starter.—Mrs. G. A. Kirkle, Modesto.

Bread Starter

Seeing in the queries a request for home made yeast I will reply:

To make a start of liquid yeast I take one peeled potato, boil until thoroughly done. Mash through soup strainer and add the water it was cooked in which should be about a cupful; one level tablespoon of salt, two spoons of sugar. Then add one-half cake of magic yeast that has been soaked in a little warm water. Let this stand until the next day, then repeat this process, only use about half of the first making as a "starter." This time you may add a little more water and after standing 24, or even 12 hours, you can make bread with this. I always save about one-half pint for my next "starter." It requires good potatoes, and one should be careful not to get any of the yeast too hot. Sometimes I grate the potato and scald it until thick like starch, add salt and sugar just the same, also add a half cup of hop tea (not too strong). This strengthens the starter.

To make bread I use one cup of liquid for one loaf of bread. I put in one spoonful of shortening — that should be regulated according to the amount baked. I first sponge my bread, use a spoon, and after it gets light I beat it well. Add more flour, stirring with spoon until it is stiff enough to work on board—until nice and smooth. Grease bowl or pan and let rise well again. I then make into loaves from the vessel it raised in, not adding any more flour. Too much potato makes the dough sticky. I usually bake about three-fourths hour in a moderate oven, sufficient to brown it well.

Hope this will help the inquirer—and others who would like to make light bread.—Mrs. E. A. C.

Keeps Six Weeks in Winter

In answer to request for homemade yeast recipe, I am sending one that I have used for years. Yet it has been known to keep six weeks in winter in the mountains and ten days in summer. Set the bread first time in the morning and if properly cared for will be ready for baking in five hours. Makes splendid bread.

Three cups boiling water, 1 medium sized potato or perhaps a little larger, 2 heaping tablespoons sugar, ¼ teaspoon salt. Put water into kettle and keep it boiling. Grate potato (after it is peeled) and add to boiling water, stirring all the while. Add sugar and salt. Cook about five minutes, stirring carefully so as not to burn. Let cool to lukewarm. Add two yeast cakes which have previously been soaked. The potato after cooking should be like a very thick starch. Put in glass jars and keep in warm place. As soon as it rises to top, shake down. Do not let it rise till it falls. Keep in warm place five or six hours. This is an excellent recipe and not hard to make after once making it. Use one pint for six big loaves of bread, keeping enough for next starter in jar in cold place.—Mrs. A. R. McElhany, Galt.

Simple Dry Yeast

In your paper dated January 29, 1921, I find inquiry for homemade yeast. Will give you what I have found to be very simple and yet very good. To get a starter I boil one medium sized potato. Mash fine. Mix in enough corn meal to make a stiff batter, then when cool, not cold, I mix a large spoonful of my bread batter in and let rise, then knead in enough corn meal to make a stiff dough and let rise again. Now I form little patties like small biscuits, place on a plate or platter and dry in an airy place. These may be kept in any dry place. I would advise making not more than six to ten at one time.—Mrs. Carl Muller, Reedley.

No Salt in Holdover Starter

Cook two or three medium sized potatoes and mash thoroughly. Add ½ cup sugar, ½ teaspoon ginger and enough warm water to fill quart fruit jar, then put in about one-half cake of dry yeast previously soaked, taking care that the water is not hot enough to scald or kill the yeast. Let this stand where it will not get chilled until it works and the potato settles to the bottom. When ready to make the bread enough water can be added to make the required quantity for the batch of bread. Save out one cup of the liquid for a starter for the next time. By leaving out salt until making the bread this process will keep yeast going indefinitely.—Mrs. J. T. Flynn, Redlands.

A merely fallen enemy may rise again, but the reconciled one is truly vanquished.

HAYES

Amazing Yields From "Fruit-Fogged" Trees

TODAY, after six years of remarkable performance in every fruit growing section, Fruit-Fog is acknowledged the most *thorough* form of spray. Its record of big fruit yields stands unmatched and supreme. It is everywhere recognized as a phenomenal success.

This is because Fruit-Fog, the Hayes Super-Spray, scientifically atomizes the solution to a vapory, fog-like fineness.

It envelops everything like a mist. Covers every twig, branch and leaf. Works its way into microscopic niches, cracks and crevices in bark, buds and foliage. Kills not alone the *outside* pests, but also the millions of *hidden* pests that no ordinary coarse spray can reach.

It is these hidden pests which sweep down from their lairs and destroy fine fruit worth untold millions each year. Yet Fruit-Fog's amazing *thoroughness* will entirely exterminate them. And add 500 to 5000% to fruit profits.

Send the coupon for our FREE Book and get all the facts about the Hayes System of Fruit-Fog Spraying. Learn how it is produced by Hayes 300 pounds high pressure and the scientific Hayes nozzle. How Hayes Power Sprayers are scientifically made to give endurance and greatest efficiency under high pressure. And why the famous Fairbanks-Morse "Z" Engine insures reliable engine service.

Learn also how Hayes Hand Sprayers kill the bugs, lice and mites—make your potatoes grow, your hogs put on money-making weight, and increase egg production from your poultry.

These amazing results have been proved again and again. Thousands of Hayes Sprayer users all over America have had the same surprising experience. The results on your farm will astound you.

LEGAL QUERIES

(Continued from Page 279.)

no cattle guards. Cattle cross the tracks, get on the third rail and are killed. Is there a state law requiring the erection of cattle guards or gates? Can suit be commenced to recover the cost of cattle killed?—Subscriber, Cement.

The civil code provides that railroad corporations must make and maintain a good and sufficient fence on both sides of their track and property; that in case they do not maintain such fence and the engine or cars kill the cattle or animals, except where the land of the road runs through public land, they must pay to the owner of such animals the fair market price thereof, unless the damage was caused by the fault of the owner of the animal. Railroad corporations may, when they procure their right of way, pay to the owner of the land and agree to the maintaining of such fence upon cost thereof. Thereafter, if claims of damages arising out of a killing of the animal of such person who may thereafter fail to construct and maintain the fence, the owners of such animals are liable to the railway by reason of damage which may be caused through the non-construction of the fence, unless it is shown that such damage occurred through the negligence of the railroad. Generally considered, it is possible that the suburban railroad company paid the costs of the cattle guards. If they did not, it would seem that they might be negligent. It would be necessary to look the matter up in their contracts of purchase.

Veteran's Tax Exemption

Is an honorably discharged veteran of the World War, now a property owner in California, entitled to tax exemption of $1,000 on property owned by him? Is such law federal and what is the procedure to secure the benefit thereof?—Subscriber, Willits.

Under the California constitution property to the amount of $1,000 of every resident in this state who has served in the army, navy, marine corps or revenue marine service of the United States in time of war and received honorable discharge therefrom, or lacking such amount of property in his own name, then so much of the property of the wife of said person as shall be necessary to equal said amount and also property to the amount of said sum of the widow or widowed mother of every such person, resident in this state, who has so served, and also property to said amount of residents, including widows, fathers and mothers, residents of this state, shall be exempted from execution, provided that this exemption shall not apply to any person owning property to the value of $5,000 or more or where the wife of such person owns property to the value of $5,000 or more, nor to a person who is not a legal resident of the state. The board of equalization is authorized to prescribe the procedure, affidavits and forms required to bring the tax exemption into effect. Each person applying for such exemption shall appear before the county assessor and give all required information and subscribe to such affidavits as may be prescribed by the board. The war with Germany and Austria is expressly recognized as one of the wars within the meaning and intent of said constitutional section.

Trees Obstructing View

I have trees planted on the corner of my land which obstruct the view of motorists. Can I be held responsible in case of accident on the corner?—Subscriber, Cudahy.

Under the motor vehicle act, in the case of intersection of highways or any obstruction around corners or curves in the highway where the driver's view of the road is obstructed, no person shall drive the vehicle at a greater speed than ten miles an hour. This is in addition to the general provision that the driver shall keep a good look out and drive carefully. There would be no possible cause of action against the owner of the property.

Compulsory School Attendance

Does the law require a boy 16 years of age, living two and one-half miles from school house, to attend school?—Subscriber, Napa.

Every parent or other person having the control of a child of the age of eight to 16 years, both inclusive, shall be required to send the child to a full time day school for the full time such school shall be in session, provided that when children reside more than two miles from the school house by the nearest traveled road, such exemption shall be only by a written approval of the county superintendent of schools and notice thereof filed with the board of trustees of the school district.

Note Outlawing

How long is required for a promissory note or open account to outlaw?—Subscriber, Ducor.

An action upon any contract, obligation, or liability founded upon an instrument in writing or an action to recover upon a book account, whether consisting of one or more entries, as upon an account current, may be brought within four years from the date of maturity, provided, however, that when the account stated is based upon one item, the time shall begin to run from the time of said item and for an account of more than one item the account shall begin to run from the time of the last item.

Naturalization

I was born in Canada but have lived in the United States for 17 years and am now 20. Is it necessary to apply for citizenship papers now or shall I wait until I am 21 years of age?—Subscriber, Wasco.

After an alien has reached the age of 18 years he may declare on oath before the clerk of a naturalization court that it is his intent to become a citizen of the United States, so it is optional with the alien as to when he should make this declaration.

Right of Way

A road which has been used by the public for a period of 12 years or more and graded, but never dedicated to the county, passes through my property. Is it within my rights to close the road? Can I force a corporation which has placed power poles to pay for the right of way?—Subscriber, Ducor.

In such cases it is generally best to make a careful examination of the history of the particular road. The general definition of highways is that all roads, streets, alleys, lanes, courts, trails and bridges laid out or erected as such by the public, or if laid out or erected by others, dedicated or abandoned to the public or made such in actions for the partition of real property are public highways. An excellent method for you to test the matter would be to bar the road and then somebody would bring suit to determine the right of passage. The history of the matter would thereupon be thrashed out in court and a judgment rendered. The same would apply to power poles placed on your property. The question as to that point is so indefinite that no answer can be made. An action for trespass can be brought against the corporation placing poles there and for damage for their occupation of the premises. If the corporation could not justify, they either have to remove the poles or pay for them.

Water Rate

On the rear of my premises I have a two room apartment. The tenant procures water from a faucet. The water company insists that I pay double minimum, as the tenant is not under the same roof and the law requires that each household pay a minimum, even though there is only one meter.—Subscriber, Newhall.

There seems to be no general law covering this minimum rate, but it is undoubtedly a rate which has been fixed by the railroad commission. You should write to them at their Los Angeles office for further information.

One of the World's Great Dams

By C. L. Hughes

READERS of the Cultivator will perhaps find something familiar in the title of this article and some may remember it as one of the headlines used in the display advertising of the Rosamaines Rancho dispersal sale in October, 1920, at Riverside.

The line was used in reference to the great registered Holstein cow Gerben Abbekerk Maid 180387, and admitting the accuracy of the slogan of one of the great advertising agencies that "Advertising Is Truth Well Told," there is probably no other group of six words that would tell more of the truth about this great cow.

It was my privilege to be one of the comittee from the California Holstein-Friesian Association called upon to present the claims and merits of the Holstein-Friesian breed to the settlers at the state land settlement at Delhi, last September, and as I was just back from making the preliminary arrangements for the Rosamaines dispersal I had very vividly in mind the greatness of Gerben Abbekerk Maid on account of her accomplishments in the Stalder herd, and used her as an illustration of what a breeder may do through one really great Holstein cow. Those who were present at that meeting may remember that I ventured the prophecy that when the sale was over it would be found that Gerben Abbekerk Maid and her descendants in the sale would realize not far from $50.000 for her owner. Now this article is not designed to prove my powers as a prophet, although it so happens that my estimate was not far wrong, but is intended to show the wonderful possibilities there are in the ownership of an outstanding Holstein cow.

Gerben Abbekerk Maid was bred by A. T. Kinzer, Turlock, and was calved the property of Phil Rutherford of the same place on April 18, 1911. She is sired by Sir Skylark Ormsby Hengerveld, a half brother to Pietertje Maid Ormsby, a bull bred by Malcolm H. Gardner, superintendent of Advanced Registry for the Holstein-Friesian Association of America. Her dam is Shadybrook Gerben Abbekerk Ononis, a cow that was still alive a year or so ago and possibly is yet, owned the last I knew of her by the Lewis Company. San Jose. During the winter of 1913-1914 Gerben Abbekerk Maid was purchased by A. J. Stalder and went to his Rosamaines Rancho to begin her great work as a producer and breeder. The purchase included her young daughter, Stanislaus Abbekerk Maid, and she was in calf when sold to King Pontiac Netherland Segis, the son of King of the Pontiacs, owned for some years by Otto McClure. Her first freshening at her new home was on May 9, 1914, when she dropped the bull King Pontiac Netherland Segis 3d, who later became the leading Rosamaines herd sire, and through him, principally Gerben Abbekerk Maid became the source of a great herd of cattle.

At this freshening she was placed on official test and as a senior four year old made 30.10 pounds butter from 622 pounds milk in seven days. Calving again within 12 months she made as a five year old 34.21 pounds butter from 686 9 pounds milk in seven days, and 132.87 pounds butter from 3190.7 pounds milk in 30 days. Her next calving at seven years she made 34.46 pounds butter from 642.8 pounds milk in seven days, and 138.19 pounds butter from 3037.4 pounds milk in 30 days. None of these records were made under any but ordinary conditions. The writer was present during a part of one of her tests, and she was being milked in the stanchions in the concrete floored milking shed and turned out with the other test cows between milkings. I believe I am correct in stating that all of her records were made under the same conditions as she was never tested again after the new test barn was built at Rosamaines.

When Mr. Stalder decided to disperse his herd last year Gerben Abbekerk Maid had been in the herd between six and seven years. had made the records noted above, had passed her ninth birthday, had nine living sons and daughters, and a host of descendants. Now let us if possible reduce to a dollars and cents basis the worth of this great cow as shown by the records of the Rosamaines dispersal. We find these figures:

Gerben Abbekerk Maid

Her 4 daughters sold for $5675, an average of $1419.

Her 2 sons sold for $3400, an average of $1700.

Her 44 grandaughters sold for $28,845, an average of $655.

Her 17 grandsons sold for $3025, an average of $177.

Her 23 greatgranddaughters sold for $8390, an average of $365.

Her 10 greatgrandsons sold for $1322.50, an average of $132.25.

Thus it will be found that the sale contained an even hundred of her descendants that sold for a total of $50,657.50, quite a tidy little sum.

In addition to the above, the grand old cow herself sold for $1000, and seven of her half sisters by the same sire, all 2 year olds, sold for an average of almost $700. These figures do not include the large number of descendants of Gerben Abbekerk Maid which Mr. Stalder sold at private and public sale during the six years he owned her, and as she was only nine years old when sold it may easily be

The 1921 Guaranty Sale
"The Pacific Coast Holstein Classic"

The Bulls To Which the 35 Bred Females in this Sale Are Safe in Calf.

KING SEGIS ALCARTRA PRILLY, three times Grand Champion at California State Fair. His daughters now making wonderful records at first calving.

KING SEGIS ALCARTRA ABBEKERK, whose first daughters to freshen average over 22 lbs. butter in 7 days.

K. S. P. J. COUNT, a 30 lb. son of King Segis Pontiac Jannek, the great sire of show ring winners.

SIR AAGGIE DE KOL MEAD, son of Miss Valley Mead De Kol Walker and Sir Aaggie De Kol Acme.

MATADOR SEGIS WALKER, sire of the new world's record junior 2 year old for yearly milk production; half brother to the world's record milk producer Pietertje Segis Prospect; sire of outstanding show ring winners.

CARNATION KING SYLVIA, the $106,000.00 son of May Echo Sylvia.

SIR PIETERTJE ORMSBY MERCEDES 43D, a great long distance son of Sir Pietertje Ormsby Mercedes.

SIR PIETERTJE ORMSBY CANARY, another great long distance son of Sir Pietertje Ormsby Mercedes.

SIR AAGGIE MEAD, son of Sir Aaggie De Kol Acme and the 1215 strictly official yearly record cow Aralia De Kol Mead.

SIR AAGGIE DE KOL ACME 2ND, son of Sir Aaggie De Kol Acme and the 1100 lb. yearly record cow Aralia De Kol 3d.

KING KORNDYKE PONTIAC 20TH, the $12000.00 son of Miss Valley Mead De Kol Walker.

KING KORNDYKE PONTIAC ACME, the $41,000.00 son of King Korndyke Pontiac 20th and Miss Aaggie Acme Burke.

PRINCE WALKER CORNUCOPIA, 36 pound son of Prince Gelsche Walker.

50 REGISTERED HOLSTEIN TOPS

State Fair Grounds, Sacramento, Cal.
Thursday, March 17, 1921

This is the Fourth Annual Holstein Guaranty Sale, an event that has won a high place in Pacific Coast Holstein affairs because of the very high quality of cattle regularly offered, and the very satisfactory results most buyers have secured from cattle bought in previous Guaranty Sales.

The cattle for this offering were selected by H. V. Bridgford, Alex Whaley, G. M. Brown and C. L. Hughes, a Committee appointed by F. L. Morris, President of the California Holstein-Friesian Association, working under instructions different than those of former selections, and we believe the result has added much to the attractiveness of this event.

Within California cattle were selected only from herds owned by members of California Holstein-Friesian Association, a policy that will hereafter be observed in selecting cattle for this event.

No open heifers are included in the sale list, the 43 females in the offering including

Eight Fresh Cows Selling Open.
Twenty Cows and Heifers due to Calve in March, April and May.
Six Cows and Heifers Due to Calve in June and July.
Nine Cows and Heifers Due to Calve in September and October.

In presenting this offering we do so in the firm belief that the new regulations guiding the selection of cattle have resulted in a wonderfully improved opportunity for the buyer, the open cows making a most satisfactory attraction for the owners of high-class herd sires who wish such females for their service, and the safe-in-calf females, which compose so large a percentage of the sale, making the best possible object for investment for the beginning breeder, who will not have long to wait for valuable increase.

Particular attention is called to the reference sires listed at the left, the bulls to which the great females in this sale are safe in calf. Calves by any of them will do credit to any herd.

SEVEN SPLENDID YOUNG BULLS will appear in this sale. Four of them are out of dams with over 1000 lbs. butter in one year; three of them are out of dams with 31, 36, and 39 lb. 7 days records; one is a son of the $106,000 bull Carnation King Sylvia; one has an average of 1043 lbs. butter in one year for six of his seven nearest dams. Every one of them is a real herd sire prospect.

EVERY ANIMAL POSITIVELY GUARANTEED TO BE A BREEDER; EVERY ANIMAL TUBERCULIN TESTED AND SOLD SUBJECT TO 60 DAY RETEST BY THE BUYER.

IN NEXT WEEK'S ISSUE we will give an outline of the great individuals in this sale. Watch for it, for it is a remarkable offering.

Catalog of Sale Mailed Free on Request. A Postal Will Do.

Live Stock News Notes

LIVESTOCK SALE CALENDAR

Holsteins

March 17, Holstein Guaranty Sale, Sacramento.
April 14—R. F. Guerin, Tulare.
April 21 and 22—Santa Anita Rancho.
May 5—Victory Herd, Carruthers.

Poland Chinas

February 26, Kings County Poland China Breeders Association, Hanford.
February 28, Mrs. Nettie Andrews, Modesto.
March 1, Hugh C. Shinn, Tulare.

Dr. L. J. Anderson, Placerville, until recently field secretary for the California Duroc Breeders Association, recently purchased 20 purebred Ayrshire cows from J. P. Walker, Visalia.

At a recent meeting of the Northern California Wool Growers Association held at Red Bluff plans were discussed for the establishment of a bonded and licensed warehouse for the grading and storage of wool.

R. J. Yates of Orland has sold his entire herd of Poland China hogs to Fred A. Clark, owner of the Capay Rancho. The transaction included more than 100 head of sows and gilts and the several herd boars.

Dr. J. J. Summerfield, Santa Rosa, veteran breeder of Tamworth swine, reports the sale of six choice sows to the Veterans Home, Yountville. The sale included several prominent winners at recent shows.

Carnation Matador Nora, a senior yearling Holstein heifer owned by the Carnation Stock Farms, has established a new world's record for 365 days milk production of 20,885.7 pounds. She is a daughter of Matador Segis Walker.

E. E. McNeil, Fresno, is laying the foundataion for one of the best Poland China herds in the state. He recently bought Giant Prospect, the great young boar shown by Chas. Gatewood at the state fair. In addition to this he has just received a July boar by The Challenger from L. R. McClarnon, Braddyville, Iowa. This is one of the best young boars ever brought to the state. Also a September boar pig sired by Checkers from Jim Bloomendaal, Alton, Iowa.

The San Luis Obispo County Jersey Breeders Association will hold a meeting at San Luis Obispo, February 10. Plans will be discussed for bringing into the county a carload of registered Jerseys. Professor V. C. Bryant, secretary of the California Jersey Breeders Association, will address the meeting. Acting Secretary Warren C. Day says that the members of the local association are determined to make San Luis Obispo the leading Jersey county in the state.

The excellent herd of 37 Guernseys built up by the late Curtis H. Lindley at Santa Cruz has been sold to the Brown Bulb Co. of Capitola near Santa Cruz. The foundation of this herd is largely imported stock and it includes a number of fine individuals. The Brown Bulb Co. makes a specialty of high grade bulbs and it recognizes the value of barnyard fertilizer. The herd will be maintained for this purpose, as well as for the wonderful milk which Guernsey cows produce.

Mansell Korndyke Frances, the 34.10 pound senior three year old Holstein owned by Fred W. Kiesel of Sacramento, has completed a 30 record with 136.14 pounds of butter and 2,461.4 pounds of milk to her credit. Rest Easy Pontiac Veeman, a senior four year old, has 116.46 pounds butter from 2,146.8 pounds milk in 30 days, and Jane Garden Virginia Korndyke, a junior two year old daughter of Prince Gelsche Walker Korndyke, has finished a seven day record of 18.90 pounds of butter from 412.5 pounds of milk.

Miss Dottie Morgan, a young Duroc enthusiast of Bakersfield, has purchased of William V. Mong, Your Duroc Farm, Whittier, two gilts by My Partner and out of Model Juanita 3rd. They are from the litter that was farrowed at the livestock show in Los Angeles last fall. From the same litter the Standard Oil Company recently purchased a very good boar prospect to head their herd of purebred Durocs. Two of their litter mates, My Partner's Top Colonel and Partner's Milk Maid, are being kept and developed by Mr. Mong to place with his show herd for the coming fall circuits.

Geo. Knight, head tester for the Los Angeles Association, states that the increased production of the 3,000 cows in the association for the month of December, 1920, compared to December, 1919, means over $30.000 per month. The average for December, 1920, was 36 pounds per cow compared to 28 pounds a year ago. Twenty-four thousands pounds of fat at $1.30 per pound (Los Angeles whole milk price) equals $31,200. Cups and medals to the value of $1,000 are being offered in the association this year for prizes for the leading herds and cows. Certificates of production will be issued also to all cows making over 400 pounds of fat, and to heifers making 300 pounds of fat.

Adirondac Wietske Dairy Maid, the great 41 pound cow owned by Bridgford Holstein Company, Patterson, will complete her yearly record on February 12 with right around 32,000 pounds milk and 1.300 pounds butter. She is in wonderful physical bloom at the end of her year and is due to calve again in April. Six daughters of the famous three times grand champion bull, King Segis Alcartra Prilly, have freshened in the Bridgford herd and have completed short time records that stamp them as real producers. Among them the senior two year old Bessie Veeman Alcartra made 24.27 pounds butter from 460.5 pounds milk in seven days; the senior two year old Jessie Fobes Segis Prilly made 23.02 pounds butter from 456.8 pounds milk in seven days and 88.75 pounds butter from 2,119.1 pounds milk in 30 days; the junior two year old Louise Alcartra Prilly made 23.88 pounds butter from 547.4 pounds milk in seven days and 89.98 pounds butter from 2,105.2 pounds milk in 30 days; the junior two year old Canary Segis Prilly made 20.45 pounds butter from 401.3 pounds milk in seven days and 79.02 pounds butter from 1,963 pounds milk in 30 days; the senior two year old Miss Alcartra Pontiac Prilly made 18.87 pounds buter from 538.5 pounds milk in seven days; and the senior two year old Sarah Topsy Alcartra made 17.92 pounds butter from 401.05 pounds milk in seven days. Each of these six heifers has milked over 75 pounds her best day and all are being carried on yearly test. Another heifer in the Bridgford herd, Karlray Ormsby Alcartra, has made 19,813 pounds milk and 765 pounds butter in 305 days, the latter a world's record for a junior two year old. She is a daughter of King Segis Alcartra Abbekerk.

Roy M. Hagan, who has been assistant state leader of agricultural club work in this state, has tendered his resignation to the University of California and has accepted the secretaryship of the California Cattlemen's Association. Hagan will succeed the present secretary, D. J. Stolley, about April 1. Mr. Hagan is a graduate of the collee of agriculture and is credited with having organized the first club work undertaken in this state. The position that he leaves will be filled by Frank M. Spurrie, who has been assistant farm director in San Joaquin County.

Bert H. Wilkinson, who has for years been manager and partner in the Falfadale Farm Duroc herd, has assumed charge of the Sierra Vista herd owned by Cash & Kyne of Perris. Wilkinson purchased the boar Great Orion Sensation Jr. as a pig and developed him into one of the great show and breeding boars of the state. At the Sierra Vista Ranch he will have the most modern equipment to work with and a fine foundation herd of Durocs is there to be developed.

A. J. Elliott, Tulare, reports the following recent sales of Poland Chinas: A boar pig sired by Hercules Jr.

to the Bakersfield pig club; boar pig by The Californian to Verne Dotts, Tipton; boar by The Westerner and eight sow pigs to a pig club at Strathmore and four sow pigs to a club at Porterville.

"HOW ARE CATTLE SELLING?"

(Continued from Page 267.)

in my opinion the coming year is going to be particularly advantageous to the men who are about to establish new breeding herds, due to the extraordinary selection they will be afforded in the coming public sales and to the fact that I am absolutely convinced that not many months hence there will be a sharp advance in price levels for the more desirable cattle.

The same underlying principles affect the beef breeds, although perhaps the outstanding weakness of the business of raising beef cattle at the present time is found in the quality of the cattle. Low markets and high costs of production expose the scrub meat animal of nondescript blood just as surely as the Babcock test exposes the scrub dairy cow, and one of the greatest problems of the beef grower, if not the greatest, lies in the improvement of the blood in his herd, that more economical gains may be made and that his cattle may be cashed in shorter growing or feeding periods. Purebred beef bulls have demonstrated thousands of times their ability to sire the sorts that go to market several months earlier and carrying several hundred pounds more weight with better quality than can be the case when operating with scrub blood. This fact has been coming home all too slowly to our cattlemen, but the circle of knowledge is expanding and gathering speed as it expands, and this fact is one of the great sound foundations upon which the breeding of purebred beef cattle rests today in California.

As to the future facing the breeders of registered beef cattle in California, both immediate and remote, it appears particularly attractive to me It seems to be that for some years to come the breeding of registered beef cattle in this state is going to be strictly upon a range bull basis. And to my mind the beef cattle breeding situation in California is in a somewhat curious position at present. On the one hand we have a demand for purebred range bulls that so far exceeds the capacity of production of our registered breeding herds that thousands of such bulls are shipped into California every year from the breeding grounds of the Middle West. On the other hand we have seen during the past three or four years in California the establishment of registered breeding herds of Herefords, Shorthorns and a few Angus upon animals of the very highest breeding and quality, no doubt purchased at prices commensurate with their worth, prices that would hardly seem practical if they must become the sires and dams of range bulls only or of offspring that will produce only range bulls. During this same period it has seemed to me that there have been a disproportionately small number of registered breeding herds founded with good, big dependable breeding cows that might perhaps have what is commonly known as a "plain" pedigree, but headed by bulls with just as much breed character and rich pedigree as it is possible to get. It has seemed to me that the establishment of a large number of such herds is the crying need in California today, for herds of this character will admirably serve two purposes: First, they will be the source of supply for the thousands of range bulls now shipped into the state annually, and will realize for their owners substantial returns on the initial investment in such animals, and second, they will logically absorb most of the very high-class animals produced by the breeders whose herds have been founded strictly upon high-class foundation, and who must have a market for such surplus at much more than range bull price levels in order to realize on their investments.

Following that line of reasoning it would therefore appear that there exists in California today a most attractive promise to the men who will found a herd of registered breeding animals of his very favorite beef breed, laying his foundation upon the sort of females that he may procure at prices within their worth as dams of range bulls, and heading them with the best bull his resources will permit. From such a beginning, with a herd that will return him a regular income, he may from time to time add an outstanding individual or two with fashionable pedigree, and thus in time become the owner of a herd with all the popular requirements as to pedigree. Certainly it is a venture that can hardly fail, with good business methods, to return handsomely even if confined strictly to the production of range bulls, and the sale of surplus females to other breeders operating on a range bull basis.

Such being the present situation in California, there is no sound reason for anything except higher price levels from now on for registered breeding animals of the beef breeds. California breeders have inaugurated an especially clean and high class manner of presenting their cattle at public sale, and the prices so far realized have been substantial and have been based upon actual cash transactions, with no abortive efforts at any time to bring about fictitious averages or high individual prices, consequently there is no water to be squeezed out of the price averages covering the past few years.

NEVADA HEREFORD RANCH

We always carry a large herd of high-class Herefords and at the present time we are offering:

A splendid lot of young cows with Harris Standard 2nd calves at foot, and many of them rebred

A nice selection of young cows and heifers bred to our herd bulls

A choice collection of open heifers.

A lot of good rugged range bulls. These are the real money making kind, and they are priced to make money for the buyers. We will sell them in car lots or in lots to suit buyers.

We also have some choice young bulls of herd-header caliber that we will sell well worth the money.

We invite your inspection.

John H. Cazier & Sons Co.
Otis Cordell, Herdsman Wells, Nevada

Our ranch is on the main line of both the S. P. and W. P. railroads and only a twenty minutes drive from Wells.

SIERRA VISTA HEREFORDS
One of the largest herds in the West. Built on a Repeater and Fairfax foundation. At present we have to offer 24 choice young bulls ready for service.

ONE OF THE WORLD'S GREAT DAMS

(Continued from Page 287.)

understood that many of her descendants included in the sale list were just calves.

Gerben Abbekerk Maid and her daughter, Aralia Maid, were both bought by Robert N. Clapp, who has them at his place, Sycamore Acres, Nuevo, and the grand old matron is due to calve again on April 20, 1921, to the service of Sir Ormsby Skylark Rauwerd, a 34 pound son of Sir Ormsby Skylark. She is said to be in wonderful physical condition, looking fit to continue her remarkable performance in the hands of her new owner.

Gerben Abbekerk Maid is an exceptional cow, but there are many exceptional cows, unknown and unsung. When she fell into the hands of A. J. Stalder she became the property of a man whose accomplishments as a breeder were founded upon absolutely nothing except that rare quality sometimes referred to as horse sense. Rosamaines Rancho was a real farm, first, last and all the time, a place where only the most practical things found place, and the development of one cow, Gerben Abbekerk Maid, into an asset readily cashed into a very substantial sum of money, was only one result of the practical application of common sense.

This is the story of Gerben Abbekerk Maid to date. I wonder how many men are overlooking oportunities in their own herds to develop an asset that would approach but might not equal her performance?

Moral: Horse sense is a good thing to use in the cow business.

The LAWRENCE-WILLIAMS COMPANY, Cleveland, O.

MRS. ANDREWS' SALE OF POLAND CHINAS

The stage is all set ready for the sale of a fine line of Poland Chinas on the ranch of Mrs. Nettie Andrews, Modesto, next Monday. We referred last week to a number of attractive features of this sale, and especially to the fine sows which have been bred to I Am King. The text of the article was correct, but in the heading a mistake was made in referring to it as a "Dispersal Sale." Mrs. Andrews will remain in the Poland China game.

DIAMOND BAR'S GREAT SALE

By Jack Klein

THERE were no tops—they were all tops—in the Diamond Bar's second big sale of Duroc sows. A perfect day and a big crowd were part of the features. The excellent hogs and ready buyers were the balance. There were daughters of such great boars as Pathfinder, Great Pathfinder and Mammoth Sensation Junior, bred to the Diamond Bar boars, Ace of Pathfinders and Mammoth Sensation Jr., and a few to the young boar, Diamond Sensation, to choose from, and they sold well.

Cols. Geo. W. Bell and John Davis were in charge of the sale and it moved along quickly and smoothly, and the average of over $200 was the best on the coast since prices began to fall. The buyers were eager for the animals at the price, and it would have been possible to sell a lot more hogs of the same kind if they had been available.

The offering was very uniform and the honor of topping the sale went to the show gilt, Cherry Duchess 2nd. She is by Ace of Pathfinder and out of a granddaughter of Pathfinder and, with one brother and two sisters, she brought home 16 firsts from the shows last fall. She was first junior gilt and grand champion at Los Angeles. Bidding was snappy and she was finally knocked down to W. P. Hodge of Hinkley for $460. Mr. Hodge purchased her prize winning brother after the Riverside show last fall and knew what he wanted. Nineteen different men took hogs home. Ten of these were new breeders, and of the remaining nine all but one had bought in last year's sale.

The Ace of Pathfinders was the big drawing card and sows bred to him were in demand while his gilts brought excellent prices. He was driven into the ring in the best condition he has shown since being in the West and that added to the popularity of his offspring.

A detailed list of the sales follows:

Critic Rose, Winsor Ranch, $265.
Janetto Wonder, J. P. Walker, $275.
Model Cherry 2d, Osterman & Osterman, $145.
Esther Gano Wonder, C. S. Volle, $120.
Creator's Queen, J. P. Walker, $325.
Model Fern 2d, J. M. Pickarts & Son, $360.
Mary Pathfinder, Osterman & Osterman, $285.
May Pathfinder, Victor Magee, $285.
Nervey Pathfinder, Sierra Vista Stock Ranch $275.
Defender Louise 9th Lawton & Walker $160.
Model Lucy 5th, Walter Greening, $125.
Model Hattie, Walter Greening, $110.
Ruby Wonder Again, Sargent Brothers, $175.
Pathfinder's Irene, Lawton & Walker, $140.
Queen of Col, Sierra Vista Stock Ranch, $140.
Valley Giant 4th, Sierra Vista Stock Ranch, $200.
Golden Millie 1st, E. F. Hopkins, $135.
Rose Orion 2d, Sargent Brothers, $260.
Cherry Rose, C. A. Lowry, $200.
Wonder's Queen, Victor Magee, $295.
Model Lucy 2d Chas. H. Tyler, $125.
Cherry's Rose, G. Allan Goodell, $150.
Maud Pathfinder 2d, W. P. Hodge, $210.
Mammoth Belle, E. F. Hopkins, $165.
Model Lucy 2d, W. P. Hodge, $175.
Model Sensation 2d, L. L. Brentner Jr., $145.
Model Sensation, Howard Berg, $140.
Model Sensation 3d, C. S. Volle, $145.
Lady Uneeda, C. S. Volle, $155.
Uneeda Lady 4th, C. S. Volle, $155.
Miss I Am 5th, Lawton & Walker, $145.
Cherry Duchess 2d W. P. Hodge, $460.
Mammoth Rose, W. H. Dunee, $155.
Esther Pathfinder, Sargent Brothers, $165.
Bess Pathfinder 2d, Sierra Vista Stock Ranch, $250.

J. P. WALKER BUYS GREAT ORION SENSATION JR.

Johnny Walker, owner of the A1 Duroc Ranch of Visalia, was the high man in the bidding for the great herd boar, Great Orion Sensation Jr., at the Falfadale Farm dispersal sale. The price was the very conservative one of $5000.

Great Orion Sensation Jr. is a son of the world's champion boar, Great Orion Sensation, and is himself a great show boar, having been reserve grand champion at the State Fair and grand champion at Los Angeles, Tulare and Riverside. He is a great sire and his get were winners all around the circuit.

The sale day was rainy and not a very large crowd turned out. The sows went at bargain prices and after a dozen were sold it was deemed advisable to stop selling.

J. P. Walker arranged to take the 55 head which were not sold, so the Falfadale Farm herd is no more. Cols. Geo. W. Bell and John Davis very ably conducted the sale. The list follows:

Great Orion Sensation Jr. J. P. Walker, $5,000; Great Orioness, Sierra Vista, $195.
Iowa Maid, J. P. Walker, $130.
Pathfinder Princess, H. R. Hertel, $210.
Miss Great Wonder, Charnock Ranch, $180.
Unnamed gilt, W. H. Dupee, $150.
Unnamed gilt, Sierra Vista, $100.
Unnamed gilt, Victor Magee, $100.
Unnamed gilt, C. M. Pilgrim, $75.
Defender's Princess 2d, C. C. Ellis, $170.
Orion's Defender Princess, C. M. Pilgrim $105.
Orion Lassie 2d, Diamond Bar, $100.
Great Orioness 4th, Victor Magee, $225.

HUGH SHINN TO DISPERSE HERD

Poland China breeders of this state will regret to learn that bad health is causing Hugh C. Shinn, Tulare, to dispose of his Fortuna herd of Poland Chinas. Hugh is one of the best known breeders and showmen on the coast and his retirement will be a distinct loss to the fraternity. His entire show herd that was one of the heaviest winners at Sacramento last year and the carefully selected prospects for this year will all sell at the sales pavilion at the Tulare fair grounds, Tuesday, March 1. The great sire, The Californian, and The Skipper by The Pilot will also find new owners on that date. Any breeder wanting to strengthen his show herd for 1921 will find what he needs in this sale.

BASSETT ROSS AND CRAWSHAW SALE

The Percheron horses sold by M. Bassett, Hanford, Tuesday, February 15, brought a very good range of prices. Most of the young stuff and the grades were bought by local parties. Tagus Ranch, Tulare, bought two four year old stallions at good figures. The top of the sale was $600 for the grand champion, Ithos, purchased by

You CAN Afford a Good Bull!

We know from long experience that many a dairyman thinks he can't afford to buy a good registered Holstein bull, looking only at the immediate investment and not at the final results.

We also know from long experience that when a dairyman has once owned a good registered Holstein bull long enough for his daughters to reach milking age, he is certain to look back and wonder how he could have been so short sighted as to put off buying one for so long.

The greater production that such a bull will breed into an ordinary dairy herd has been proven so many thousands of times that it ought not to be necessary to repeat the facts here, but there is another feature that is of great dollars and cents value—the added value to the animals themselves, sired by such a bull, a value enhanced by their added ability to produce milk and butterfat, and the greater uniformity of type and color fixed by the pure bred sire. To illustrate the added value a pure bred Holstein sire bestows upon his grade offspring, let us cite two instances that are a matter of public sale record in California.

SIR AAGGIE DE KOL ACME 2ND

In producing this bull we bred one of the greatest yearly record bulls of the breed, and the greatness of the yearly records behind him is fully matched by the known transmitting powers of the families he represents.

His sire, SIR AAGGIE DE KOL ACME, is by a son of the great foundation cow Aralia De Kol, the first cow to make over 28,000 lbs. milk in one year. His dam, Aaggie Acme of Riverside 2nd, holds the world's strictly official yearly butter record of 1,331.78 lbs., she is out of Aaggie Acme of Riverside, 1,054.10 lbs. butter in one year at 11½ years of age. Aaggie Acme of Riverside 2nd is also the dam of Miss Aaggie Acme Burke, 1,034.66 lbs. butter from 24,338.9 lbs. milk in one year as a first calf junior 2 year old, that latter a world's record when made, she in turn the dam of the $41,000.00 bull King Korndyke Pontiac Acme. This heifer recently made 35.38 lbs. butter from 726.2 lbs. milk in 7 days as a junior 4 year old.

His dam, ARALIA DE KOL 3d, is by Juliana King of Riverside, who has four daughters above 1,000 lbs. butter in one year, and is out of Aralia De Kol, the noted yearly record foundation cow. Aralia De Kol 3d was an individual of show quality, made 1,100.48 lbs. butter from 24,554.1 lbs. milk in one year at mature age. Her record of 772.94 lbs. butter from 17,509.5 lbs. milk in one year as a junior 2 year old stood as a California record for several years.

Five of the seven nearest dams of SIR AAGGIE DE KOL ACME 2ND average 1,154.21 lbs. butter and 25,056.1 lbs. milk in one year, one of the highest in the world.

All five of these dams have two yearly records, and the average two year production of the five is 2,069.85 lbs. butter and 44,748.6 lbs. milk, and includes one junior 2 year old record, one junior 4 year old record, two eleven year old records, and one twelve year old record.

SIR AAGGIE DE KOL ACME 2ND is an individual of high merit, and has a most promising lot of young daughters, none of which are yet of milking age, but they show every evidence of being capable of carrying on their great inherited production. He heads the choice herd of registered Holsteins owned by

ALEX WHALEY

Tulare California

When Mr. James McGillivray, Sacramento, decided to disperse all of his grade Holsteins at public auction to make room for his rapidly expanding registered herd, he had in the sale eight grade daughters of King Mead of Riverside. These eight cows were sold in pairs at prices from $300 to $350 per head for the entire eight head. There were other cows in the sale that perhaps looked as well, but the fact that they were sired by King Mead of Riverside, and that one of their grade sisters by the same sire had led the Sacramento-Yolo Cow Testing Association, unquestionably were the big factors in bringing the price.

Again, Napa State Hospital, Napa, wished to reduce their herd of young stock, all grade Holsteins, and to accomplish this held a public sale of about 100 head. In the entire sale there were only eight cows in milk, and a very large proportion were unbred heifers and heifer calves. Yet the entire offering averaged over $125 per head, with one grade heifer selling for $300. In this case the seller was able to give the private milk record of practically every dam of the heifers, and in addition the name of the registered Holstein sire.

Happenings like these come regularly, right in your own community, perhaps, where one or several grade cows known to be sired by registered Holstein bulls bring added values because of the fact.

How many $25 to $50 increases in the price per head would it take to pay for the right kind of a registered Holstein bull in your herd? CAN YOU AFFORD NOT TO OWN SUCH A BULL?

We can usually supply you with the right sort of bull to breed greater value into a dairy herd, and our prices have always been considered very reasonable for such quality. Let us hear from you if you are unable to visit our place.

ALSO—Watch this series of announcements. The bulls featured, heading the herds of other breeders, represent our greatest producing families, and cover the length and breadth of California. Perhaps one of them is right in your own community and you can get one of his sons right near your home.

A. W. Morris & Sons Corporation
Woodland, California

George Edwards, Palo Alto.

The sale of Poland Chinas in the afternoon by Messrs. Bassett, Ross and Crawshaw was not so successful. A good crowd was present, but few buyers were on hand. About half of the offering was sold at close to a $50 average. Col. George Bell conducted both sales in a high class manner.

PROPOSED TUBERCULOSIS LEGISLATION

By Dr. J. P. Iverson

THE pure milk law at present in effect in the state of California provides for the compulsory testing of cows in raw milk dairies. Under this act the state veterinarian, now included in the division of animal industry of the state department of agriculture, is charged with the enforcement of this phase of the law, making it necessary to inaugurate a system of tuberculin testing more comprehensive than anything that has previously been undertaken by any state in the Union.

In some other states tuberculin testing was spasmodically undertaken, either with the idea of eradication or for the purpose of educating the people to its presence and extent.

In some other cases appropriations were made that were intended to reimburse the owner in whole or in part for animals killed. These laws seem to have been based upon an insufficient fund of information, therefore have met with failure. In the first place the extent of the disease was probably not realized by the author of the law, and the limitation of the test was not reckoned with. Once the law became operative their efforts were not concentrated on any community but were applied here and there over the state wherever a dairy owner could be found who was in sympathy with the law and was willing to cooperate. Even where such owners were found they soon would be discouraged by the fact that every six months, or oftener, a number of their best cows would be claimed by the test without much apparent progress. This made it increasingly difficult to get the cooperation of their neighbors. The state officials themselves became discouraged and legislators refused to appropriate further funds to eradicate a disease when it would not eradicate and so these laws one by one have died a natural death, and rightly so. It would bankrupt the treasury of any state having any considerable amount of tuberculosis to attempt an eradication on that plan; it would break up the business of the principal dairymen of the state and would result in an inadequate supply of milk and dairy products.

However, all of these laws and their successive failures carried a lesson and our knowledge increased.

Therefore, the provision made for tuberculin testing by the pure milk law, and the provision for disposition of reactors by the regulations adopted for its enforcement, were well advised and probably the first and only workable law having to do with the testing of dairy cattle up to the time of its adoption.

The operation of this law has been successfully accomplished and its purposes largely satisfied. Its operation has shown us several things: First, that tuberculosis exists in the state to a considerable extent. Second, that it is distributed by districts, some sections having few herds unaffected, other sections being as yet little or not at all touched by the disease. This is shown by the following extract from a report by one of our veterinarians:

"I started a test in Southern Tehama County and tested north to the Oregon line. The farther north I went the fewer reactors were found. I believe that in all of Siskiyou County only two, or possibly three, herds were found infected, and in each instance I was able to trace these reactors to outside sources." Third, that there is a demand for eradication of tuberculosis, shown by the fact that literally thousands of applications not specifically required to be tested under the regulations of the law had to be refused owing to lack of funds. Fourth, that may herds may be freed of this disease by intelligent use of the test. Fifth, that it is a reliable index as to the extent of tuberculosis in a given herd or community. Sixth, it has created a demand for unaffected cows to replace reactors in raw milk dairies that cannot at the present time be supplied.

All of this has brought us to the place where further legislation, based on the information now in our possession and intended to meet the demand that has arisen for such a law, should be enacted. The nature of the proposed law will also be determined by the facts previously enumerated.

Under the proposed law a survey of the state will be made to determine those areas relatively free from tuberculosis, whereupon certain districts will be declared free areas. Within these areas all cattle will be tested and reactors removed to without the areas, and if slaughtered, will be done under inspection. In brief, it consists of the application of the accredited herd plan to districts and it is hoped that eventually these districts may be increased in size to include most or all of the state. At any rate it would prevent the further introduction of tuberculosis into those sections of the state now comparatively or altogether free; it would stop such shipments as were recently brought to our attention whereby a number of dairy cows from a section of the state heavily affected and with a history making their tubercular condition certain, were brought into territory heretofore known to contain but few tubercular cattle.

Such a law would enable us to avail ourselves of the service of federal veterinarians to the same number as employed for that purpose by the state for accredited herd work, thereby securing the expenditure of federal funds for the welfare of California that would otherwise be expended in other states. In this connection it is significant that of all important dairy States California is the only one that does not have a specific enabling act providing for accredited herd or similar tuberculosis eradication work.

GLENN COUNTY DUROC SALE

The Glenn County Duroc-Jersey Breeders Consignment Sale was held February 4. On account of rainy weather it was not very well attended, but prices were very satisfactory, an average of $43.50 on 24 head. Everything sold that went through the ring, the top sow bringing $97.50. She was sired by Uneeda Orion B. Most of the stuff went out of the county, R. A. Clark of Corning being the heavy buyer, taking nine head. David Nelson of Redding bought the top sow.—C. D. Bright.

It is reported that the marketing committee of the Pacific Rice Growers has secured a million dollars to lend to growers on their rice crops.

Don't gamble on the quality of the seeds you buy. KNOW what you are getting. For your protection, every bag of Germain's PROVEN Hairy Peruvian Alfalfa Seed is sealed and stenciled before it leaves our warehouses.

The Sierra Vista Stock Ranch, Inc.

have secured the services of Mr. B. H. Wilkinson (Bert) as superintendent of the Hog Department, and take great pleasure in making this announcement to the Stockmen of the State.

Mr. Wilkinson needs no introduction to Duroc breeders of California. His wonderful success in the show ring, his absolute honesty and the really great ability he showed in selecting and shaping GREAT ORION SENSATION, JR. have made his name known throughout the State to the men who love the red hog.

We feel that we may confidently ask the patronage of farmers and breeders, as Mr. Wilkinson's known reputation for scrupulous honesty and great ability as a judge of hogs, will assure the public of obtaining real money value.

Our constant ideal is to give the breeder the very best at the least possible price consistent with sound business principles.

Perris, Riverside County, California

He'll Improve Your Herd

Andon Prince Cornucopia, No. 321092

Sire: Segis Pontiac De Kol Burke Gerben, 20 months old, light colored, a sure and quick breeder. A blue ribbon winner, whose two nearest dams average: 31 lbs. butter in 7 days and 938 lbs. in 365 days.

Dam: Victoria Brunaro Johanna. 24.82 lbs. butter, 666.6 lbs. milk in 7 days. Best day's milking 102 lbs. at 4 years of age. This was the highest milk record made by any cow under 5 years of age during the first half of 1920. She is a very typey individual, the "OLD FASHIONED KIND" that weighs around a ton. She will be tested again in April as a 5 year old and if she does not increase her record I guarantee to refund half of your money.

Price $500.00 F. O. B. Fresno.

The Jas. J. Jeffries Dispersal

As announced briefly in our issue of last week, the Jas. J. Jeffries dispersal of registered Holsteins at Burbank on February 3 attracted the largest crowd that has yet attended a California Holstein sale, over 1,500 persons having attended. The herd was presented in splendid condition by Herdsman Koch and bidding was snappy throughout. The great group of sisters, 11 young cows sired by Allenvail Cornucopia Paul, fulfilled all the claims made for them in the pre-sale announcements and met with widespread favor among buyers. The top of the sale was reached and a new high price for a Holstein female in California at public auction established when one of the great sisters, De Kol Pet Segis, went to Fred Hartsook at $4,500 after a bidding contest with D. G. Maxwell. This great cow is the dam of the grand champion heifer K. S. P. J. Pet Segis, the latter selling for $3,800 to Maxwell. The 38 pound cow, Barron Annabel Lilith, went to Maxwell at $2,100, and was conceded to be one of the real bargains of the sale. Maxwell also secured the 1,140 pound yearly record cow, Maid Tuebie Segis, at $3,300, another bargain. Fred Hartsook materially strengthened the outstanding herd he has assembled, through his purchases in this sale. From the popular standpoint the big event of the day was the selling of the herd sire, King Segis Pontiac Jannek, who finally went to H. Michel, Santa Monica, for $4,300, a sum that was conceded to be far within his value. The offering was absorbed by 23 buyers, with perhaps more than twice that many bidders. Summarizing the sale, we find that the 28 tuberculin tested females of milking age sold for $34,910, an average of $1,246; ten bred heifers sold for $5,280, an average of $528; 15 open heifers and heifer calves sold for $6,065, an average of $404; three young bulls sold for $2,800, an average of $933; one herd bull sold for $4,300; five cows and heifers that reacted to the tuberculin test sold for $1,715, an average of $371; the entire 62 catalogued animals selling for a total of $55,070, an average of $888. At the close of the sale two newly born heifer calves and six small bull calves not catalogued sold for $1,500, making a grand total for the offering of 70 head that sold for $56,570, an average of $808. The sale was managed by California Breeders Sales and Pedigree Company, with C. L. Hughes in the box and Col. Ben A. Rhoades, Los Angeles, on the block. Following is a detailed list of sales:

BULLS

1, King Segis Pontiac Jannek, Sept. 1914, H. Michel, Santa Monica, $4300.
5, K. S. P. J. Paul Lilith, April 1920, J. M. Mayo, Compton, $1000.
8, K. S. P. J. Cornucopia Paul, Nov. 1919, Chas. L. Norvels, $825.
11, K. S. P. J. Show Boy, Feb. 1920, C. W. Anderson, Burbank, $975.
100, K. S. P. J. Lochhaven, W. W. Cochran, Los Angeles, $200.
K. S. P. J. Hengerveld Segis, G. C. Hodgell, Newhall, $55.00.
K. S. P. J. Urmogel Burke, V. Poggi, $200.
K. S. P. J. Fyke Segis, Richard Bros., Wilmington, $305.
K. S. P. J. Urmogel Segis, $95.00.
60½, Unnamed bull calf, W. H. Tindall, Puente, $325.
57½, bull calf, June 28, 1920, A. R. Doctor, $170.

FEMALES

2, Barron Annabell Lilith, Oct. 1912, D. G. Maxwell, Hollywood, $2100.
4, K. S. P. J. Barron Lillabel Lilith, Nov. 1918, D. J. Maxwell, $525.
6, Maud Tuebie Segis, April 1914, D. G. Maxwell, $3300.
7, K. S. P. J. Tuebie Burke, Jan. 1919, J. C. McGrath, Artesia, $425.
9, De Kol Pet Segis, Feb. 1914, Fred Hartsook, Lankershim, $4500.
10, K. S. P. J. Pet Segis, Dec. 1917, D. G. Maxwell, $3800.
12, Queen Canary Segis, May, 1914, Fred Hartsook, $1800.
13, K. S. P. J. Queen, March 1920, J. M. Mayo, Compton, $500.
14, Miss Madrigal Segis, Feb. 1914, H. Michel, Santa Monica, $925.
15, Madrigal Burke Segis, Dec. 1916, T. L. Tally, Los Angeles, $400.
15½, heifer calf, Burr Farm, Los Angeles, $150.
16, K. L. B. D. K. Madrigal Burke, Sept. 1919, A. R. Doctor, Los Angeles, $300.
17, K. S. P. J. Esther Madrigal, Jan. 1920, M. P. Christensen, Norwalk, $375.
18, Canary Pietertje Segis, April 1914, Fred Hartsook, $750.
19, K. S. P. J. Pietertje Girl, May 1919, Chas. L. Norvels, Long Beach, $600.
20, K. S. P. J. Pietertje Canary, April 1920, H. Michel, $425.
21, Miss Madrigal Cornucopia Segis, Feb. 1914, Fred Hartsook, $1275.
22, K. S. P. J. Madrigal, Dec. 1917, A. R. Doctor, $350.
23, K. S. P. J. White Lady, Jan. 1919, Graham and Poggi, Van Nuys, $525.
24, Dolly Canary Segis, March 1914, D. G. Maxwell, $850.
25, K. S. P. J. Dolly, Oct. 1918, D. G. Maxwell, $600.
26, Miss Floria Segis, March 1914, D .G. Maxwell, $800.
27, K. S. P. J. Floria Canary, Dec. 1919, Robt. M. Clapp, Nuevo, $525.
28, K. S. P. J. Floria Canary Segis, Oct. 1920, D. G. Maxwell, $200.
29, Belle Tuebie Segis, Feb. 1914, Fred Hartsook, $2100.
30, Viola Canary Segis, May 1914, Fred Hartsook, $1200.
31, Miss Ramona Segis, May 1914, D. G. Maxwell, $700.
32, Maud De Kol Segis, April 1914, Fred Hartsook, $2000.
33, K. S. P. J. Cornucopia Segis, Sept. 1917, Richard Bros., Wilmington, $400.
34, K. S. P. J. Cornucopia, Jan. 1918, R. W. Jessup, Glendale, $385.
35, Novelty Pauline 2nd, Feb. 1909, Fred Hartsook, $425.
36, K. S. P. J. Novelty Pauline, July 1917, Robt. M. Clapp, $900.
37, K. S. P. J. Plebe Canary, Sept. 1919, Berylwood Stock Farm, Hueneme, $550.
38, Gerben De Kol of Maplelane 2nd, March 1912, R. C. Lydston, Gardena, $400.
39, K. S. P. J. Gerben De Kol, Sept. 1919, Carl Ray, Lankershim, $425.
40, Gerben Canary Belle De Kol, Oct. 1914, D. G. Maxwell, $1450.
41, K. S. P. J. De Kol, April 1919, H. Michel, $550.
42, K. S. P. J. Canary Belle, Sept. 1920, H. Michel, $500.
43, Lockhaven Violetta, Jan. 1913, J. M. Mayo, Compton, $525.
44, K. S. P. J. Eliza Walker, Feb. 1919, Inglewood Union High School, Inglewood, $385.
45, K. S. P. J. Violetta, Dec. 1919, M. P. Christensen, $435.
46, K. L. B. D. K. Lockhaven, July, 1920, R. C. Lydston, $235.
47, K. S. P. J. Snowflake Mercedes, Jan. 1920, H. Michel, $425.
48, Alcartra Lockhaven, Sept. 1916, R. W. Jessup, $375.
49, Maybelle of St. Lawrence 3rd, May 1910, R. C. Lydston, $325.
50, Agnes Urmagel Segis, Feb. 1917, R. W. Jessup, $885.

62, K. L. B. D. K. Aeroplane Belle, Sept. 1919, Carl Ray, $400.
63, Segis Fobes Tritomia, Aug. 1914, C. W. Anderson, Burbank, $375.

THE W. A. THOMPSON DISPERSAL

The W. A. Thompson dispersal of registered Holsteins at Hynes, February 5, brought out a crowd that overflowed the new Rhoades & Rhoades sale pavilion with more than 600 persons in attendance. The cattle were presented in just thrifty condition, the offering largely composed of young things right off the pasture. The top price of $800 was reached twice, the three year old, Mechthilde Sarah Kakenstein, going to D. L. Wright, Pasadena, at that figure, while W. J. Higdon, Tulare, secured Arcula Alcartra Mead, a yearling daughter of King Mead of Riverside, at the same figure. This heifer was resold after the sale to Berylwood Stock Farm, Hueneme, whose manager, J. W. Snodgrass, hurried a bit too fast to reach the sale in time to buy this heifer and ran afoul of a speed cop, finally arriving after the heifer had been sold. Forty-five separate buyers absorbed the offering, most of the cattle staying in Southern California, with a few head purchased for the Hawaiian Islands. Thirty-nine heifer calves and tuberculin tested cows and heifers sold for $13,155, an average of $337; 13 young bulls sold for $1,780, an average of $137; six reactor cows and heifers averaged $217, and a number of unregistered animals brought the total sale up to $17,535. The sale was managed by California Breeders Sales and Pedigree Company, Sacramento, with C. L. Hughes in the box and Col. Ben A. Rhoades, Los Angeles, on the block. Following is a list of individual sales:

1, Gelsche Walker Pondyke, June 1913, S. S. Anslyn, Los Angeles, $200.
2, Unnamed heifer, April 1919, M. C. Tolle, Long Beach, $425.
3, Beauty Snowflake of Sunnyside, June 1910, H. L. Gordon, Artesia, $400.
5, Beauty Snowflake Alcartra, Aug. 1920, J. W. Mayo, Compton, $210.
7, Astera Johanna Pontiac, Dec. 1910, W. J. King, Downey, $200.
8, unnamed heifer, July 1918, G. Gustafson, Hynes, $475.

10, Empress Pontiac Flossie, July 1915, J. F. Murphy, Los Angeles, $235.
13, Pennat Cornucopia Johanna, Aug. 1912, J. F. Murphy, $375.
14, Cornucopia Johanna Morco, Dec. 1919, Chas. C. Hill, $200.
17, unnamed heifer, July 1919, M. C. Tolle, $300.
18, Aralia Alviso De Kol, Nov. 1913, C. A. Parker, Artesia, $205.
23, Bertha Abbekerk De Kol, Jan. 1919, Geo. B. Kellam, Rivera, $235.
24, Lady Artis Phroso, Oct. 1914, Walter D. Parker, Baldwin Park, $200.
25, Beauty Mechtilde Fobes Korndyke, Aug. 1915, J. F. Murphy, $350.
26, Beauty Fobes Alcartra, Oct. 1918, J. B. McGee, Whittier, $310.
28, Pauline Lady Mercedes, March 1911, J. F. Murphy, $300.
29, Pauline Lady Hollywood, July 1919, M. P. Christensen, Norwalk, $400.
33, Susanna De Kol, Jan. 1913, C. A. Parker, $335.
34, Susanna Alcartra Morco, Nov. 1919, F. D. Plavan, Santa Ana, $210.
36, Stratford Bakker Netherland, Aug. 1914, Burr Farm, Los Angeles, $210.
37, Alcartra Bakker Netherland, Sept. 1919, C. V. Harris, Compton, $210.
39, De Kol Colanthus Morco, Jan. 1920, F. D. Plavan, $245.
40, De Kol Colanthus Alcartra, Dec. 1918, D. L. Wright, Pasadena, $510.
43, Arcula Aaggie, Nov. 1916, Mais Bros., Long Beach, $700.
45, Lillian Johanna Aaltje, Oct. 1914, Burr Farm, $710.
47, Juliana Inka of Rock, Oct. 1914, C. J. Roberts, Long Beach, $490.
Juliana Alcartra, Sept. 1919, M. C. Tolle, $250.
49, Mutual De Vries De Kol, March 1915, Raitt Dairy Inc., Santa Ana, $600.
50, Mutual De Vries Alcartra, Jan. 1920, A. B. Spooner, San Luis Obispo, $250.
51, Juliana Ntherland of Rock, Oct. 1913, J. B. McGee, $300.
53, Sita De Kol Princess 2d, March 1914, J. B. McGee, $265.
55, Buckeye De Kol Walker, Jan. 1914, H. H. Finney, Santa Ana, $365.
57, Dorothy Kakenstein Segis, Sept. 1917, Raitt Dairy, Inc., $290.
59, Mechtilde Sarah Kakenstein, Dec. 1917, D. L. Wright, $800.
61, unnamed heifer, April 1919, Mais Bros., $380.
63, unnamed heifer, July 1919, Burr Farm, $700.
65, Arcula Alcartra Mead, May 1919, W. J. Higdon, $800.

Her Comfort is Your Gain

TO neglect any discomfort of the udder or teats is costly. The slightest soreness or abnormal condition makes the cow restless and reduces the flow of milk.

Cuts, Chaps, Scratches, any congestion or inflammation can be quickly cleared up by using Bag Balm, the great healing ointment for cows. Caked Bag is promptly reduced by this softening remedy. A great aid in treating Bunches and Cow Pox.

Bag Balm, in the liberal 65c package, is inexpensive insurance against serious troubles. Keep a package on hand. Sold by general stores, feed dealers and druggists. Booklet, "Dairy Wrinkles," Free.

HIGHEST PRODUCING JERSEY FOR HER AGE IN CALIFORNIA

Raleigh's Gertie's Tulip, starting a year's official test at one year, 11 months of age, produced 9025 pounds of milk and 457 pounds of butterfat, which makes her the Jersey yearling champion of California. When it is known that 457 pounds of butterfat will make 538 pounds of butter it will be seen what a real producer this Jersey cow is, and she is only beginning her career. Her milk production average for the year was practically 25 pounds daily. Her dam is Gertie's Tulip and her sire is Raleigh's Fairy Boy 9th, a descendant of Raleigh's Fairy Boy, the great Jersey show bull which won grand championship at the National Dairy Sow in 1910.

The Jersey yearling record for California was held for the past five years by Jewel of Venadera, owned by Guy H. Miller, record 442 pounds of fat at 1 year 11 months of age. It now goes to Raleigh's Gertie's Tulip.

Guy H. Miller reports the recently completed register of merit records of two cows in the Venadera herd: Olive of Venadera, beginning test at 24 months old. For the year she gave 6333 pounds of milk with an average test of 5.62 per cent of fat, making 356 pounds of butter fat. Olive of Venadera is sired by Majestic Noble Lord and is his first daughter to complete a year's test and qualify for the register of merit. Her dam is Zama of Venadera, Register of Merit test 514 pounds of fat in a year. Zama is one of the nine Register of Merit daughters of Owl of Belleview. Ramona of Venadera, beginning test as a five-year-old, produced in the year 512 pounds of butter fat. Ramona is another of the nine Register of Merit daughters of Owl of Belleview. Her dam is Gazelle of Venadera, Register of Merit test 438 pounds of fat, one of the 14 Register of Merit daughters of Marigold's Exile King. Ramona is dam of Kerma of Venadera, Register of Merit test 342 pounds of fat as a junior three year old. Both Ramona and Olive were milked and fed but twice daily while on test and ran in corral with the herd.

INCOME TAX PRIMER READY

Copies of the Income Tax Primer, recently issued by the bureau of internal revenue, which contains questions and answers relative to the filing of income tax returns, are now available at the office of the collector of internal revenue, Los Angeles and San Francisco. Copies may be obtained only through collectors' offices.

Representatives of the eight dairy units of the state dairy association met at Fresno February 12 and adopted resolutions favoring formation of a collective marketing association.

DISPERSAL SALE OF FORTUNA HERD OF POLAND CHINA HOGS

Tulare, Cal.
Tuesday, March 1st, 1921

10 bred sows, 20 bred gilts, 10 fall gilts, 2 boars. The Californian, by Mc's Big Orange, and The Skipper, by The Pilot, both sell.

The sows and gilts are sired by the leading boars of the country and are bred to the above listed boars. The offering includes my entire show herd and some great young prospects for this year's shows.

The best opportunity of the year for the man interested in better hogs to improve his herd. Buy now when opportunity presents itself. Be sure to attend.

Hugh C. Shinn, Tulare, Cal.
Col. Geo. W. Bell, Auctioneer

Eastman Ranch Poland Chinas

Herd headed by Buster Bob, Grand Champion at the strong Los Angeles Livestock Show. He is the largest junior yearling in the state and is siring some great pigs. Young stock for sale at all times. Satisfaction assured.

H. L. Graham, Mgr. San Fernando, Cal.

McNeil's Big Type Poland Chinas

Herd headed by Giant Prospect and Mc's Challenger. My sow herd is composed of a great lot of choice matrons including Polandale Betty, first prize junior yearling at Sacramento. Correspondence solicited.

CHAS. McNEIL, Route H, Box 166, Fresno, Cal.

Fortuna Herd Poland Chinas

Special prices on gilts sired by The Californian, either open or bred to The Skipper by The Pilot. Two sisters to Orange Lady, first prize senior gilt at Sacramento. Also some choice weanling boar pigs. Satisfaction assured.

Hugh C. Shinn Tulare, Cal.

Johnson's Defender Jr.

Heads my herd of carefully selected sows. He should be seen to be appreciated. I can spare a few choice females or young stock either sired by or mated to this good boar. You will be pleased with any purchases made from me.

H. C. WITHEROW Live Oak, Cal.

Sunny Side Farm

where efficiency is our watchword and the production of extra heavy milking Holsteins and big type Poland Chinas is our specialty. A few choice animals of either breed or sex for sale at all times at reasonable figures. Write for information.

R. F. Guerin Visalia, Cal.

Italian Vineyard Company Big Type Berkshires

We are offering for sale some fine big sows and gilts bred to our great herd boars for early litters. Some very special bargains to farmers and new breeders.

Everyone tuberculin tested and cholera immune.

Alex. M. Wilson, Supt. Guasti, Cal.

GEORGE W. BELL
A BUSINESS AUCTIONEER

When in need of high class auctioneering service I would be glad to have breeders and farmers correspond with me. I have had years of experience, know values and know pedigrees. I am selling for many of the leading breeders of California and am prepared to deliver the same results that have attracted this custom. Terms reasonable. Write, wire or phone.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Punctured Teat

I have a cow that cut her teat a year ago. It healed but left a hole that lets the milk run out. The cow is dry now and I would like to know if the hole would heal up solid if I seared it with a hot iron.—Subscriber, Parker, Arizona.

Yes, the hot iron may cause it to heal solid, but you must use an iron with a small point and must leave it in the opening only long enough to sear the edges. The opening in the skin is surrounded by a thin membrane which must be gotten rid of before the parts will close together. The heat from the iron may do it. A small stitch through the skin to draw the edges together would also help. These openings are not easily closed and if you are not careful you will do too much and make it worse.

Warts on Cow's Teats

I have a cow that has warts on her teats. What will cure it?—Subscriber, Parker, Arizona.

If the warts stick out and are connected with the teat with only a small base, clip them off with shears and touch the spot with a drop of nitric acid. If they are flat then touch them with nitric acid and be careful in handling the acid. Do not get the acid on any other parts nor on your hands or clothing. Use a small swab about the size of a match to apply the acid.

Quittor

I have a mare that cut her front foot in barb wire fence last October. It did not seem bad and she did not limp much for some time. I used peroxide and lime on it. It seemed to heal all right, then started swelling at the side of the foot and she got very lame. Then it broke and blood and thick, yellow pus started out and is still running. One place heals up and another breaks and it keeps her very lame. What is the trouble and how can I cure it?—Subscriber, Tulare.

Quittor is the name given to an abscess just above the hoof. In this case it was probably caused by the wire cut. In healing a small particle of foreign matter may have been enclosed in the wound or the parts may have been bruised before becoming solid enough to withstand a bump. A hard bruise or exposure to extreme cold may cause a quittor in a well foot. They are very hard to heal because the circulation of blood through those parts is limited and because the opening is above the pocket that contains the pus, thus preventing good drainage. You need a strong syringe that holds about an ounce. First syringe the cavity out with warm water that has a little soap in it. Wash this out with clean water and then inject a solution of bichloride of mercury. Get some tablets of the bichloride of mercury from your druggist such as are prepared for dressing wounds. The directions with them will be to use one in a pint of water. In your case use two to the pint of water. After syringing some of this into the pus cavity soak some surgeon's cotton with the solution and lay it over the opening and put on a bandage. Leave this on for two or three days, then repeat the dressing. Do not use any peroxide in the cavity. If it does not heal in two or three weeks substitute tincture of iodine for the bichloride solution. If a veterinarian is handy you had better get him to dress it a few times for you.

FAGEOL
WALKING TRACTOR

This tractor's unusual dependable performance and its low operating costs soon prove its value. The sole reason that there are no more in use is that the factory cannot supply the demand, notwithstanding frequent enlargements.

Wherever they become known, they are appreciated. In the 20 mile district around Pomona, Anaheim and Orange, there are more than 200 Fageols now working.

Exclusive Fageol Features
Increase their operating range
Reduce their operating cost

Meadow Maggots, or Crane Flies

By C. M. Packard and B. G. Thompson

CALIFORNIA ranges, pastures and grain fields are often badly injured during the rainy season by blackish, mud colored worms about half an inch to one inch long. These worms become exceedingly abundant in spots, sometimes as many as 300 to the square foot, and devour all the vegetation or grain in these areas. Injury by them is usually more noticeable in wet winters like the present, but they occur in serious numbers almost every winter in some locality or other, and a few usually can be found every winter throughout the range of this insect. The worms are the young or larval stages of the "crane fly" (Tipula simplex Doane). The adult flies, called by different names in different localities, are the fragile, long legged, two winged insects which look like mosquitoes but are much larger and do not bite.

Habits

The worms are hatched with the first heavy rains of winter just as the grasses and grains are sprouted by these same rains. The eggs from which they hatch were laid late the previous winter and remained dormant in the soil throughout the intervening dry season. At first the effect of their feeding is not noticeable, but as they increase in size their appetites also increase to such an extent that by January it takes about all the available pasture to furnish sufficient food for the multitude in the spots where they are excessively abundant. By the end of January or early February they become full grown, stop feeding, and begin to change to adult flies, or pupate, as we say. They change to the adult form in much the same way as caterpillars turn to butterflies. There is only one generation a year, hence when the worms begin to pupate, in January or February, depending on the season, no further injury from this species need be feared during the remainder of the growing season. The worms pupate just below the surface of the soil and the adults come out in late February or in March. A peculiarity of this species is that the females are wingless, although the males are winged. The females therefore lay their eggs within a few rods of the spot where they emerged from the ground. The eggs are deposited within a day or two after the adults emerge, in depressions in the soil, under the edges of loose stones, under clods, and among grass roots, where they lie dormant throughout the following dry season, to hatch the following winter as soon as they are thoroughly soaked by the first rains. Each female is capable of laying approximately a hundred eggs and as soon as this function is performed they die.

Control

Ordinarily this insect occurs in destructive abundance only in uncultivated range lands or in fields which have been planted on newly broken sod lands where it has had opportunity to breed and multiply undisturbed by cultivation during several preceding seasons. The worms are likely to attack almost any winter planted field crop, especially on newly broken sod land, serious injury to small grains and alfalfa already having been observed. Heretofore the only known method of preventing injury by this species has been more or less continuous cultivation. This method of control, however, is of no avail to save a crop which already has been planted and which is actually being destroyed before one's eyes by the pest. It can only forestall possible injury in future years and cannot be applied at all to large areas of range land where Tipula simplex annually destroys forage valued at thousands of dollars and sometimes actually causes livestock to die for lack of feed.

Close study of the habits of this insect by men working under the United States bureau of entomology has led to the development this year of a cheap, practical and effective method of control which can be applied at once, with immediate effect, when the worms are first observed by the farmer to be injuring his crops or pasture. By application of this method as soon as injury is noticed a large part of the crop or pasture which otherwise would be destroyed, could be saved.

The new control method is simply the use of a poison bran bait in the same way that it has been used so successfully for grasshoppers and cutworms. It was observed by B. G. Thompson of the bureau that the crane fly larvae came out upon the surface of the ground during the night. Since it was already known that they eat the parts of the plants which are above the ground as well as below, these observations immediately suggested to him the possibility that the worms would be attracted by the bran bait. Experiments were tried immediately, with the result that the mortality on the experimental plots was from 70 to 90 per cent of the worms present, as determined by actual counts of the worms in several square feet selected in favorable and unfavorable spots in the poisoned areas.

In our experiments a bait made of bran, Paris green and water, without any molasses or lemons added for flavoring, killed as high a percentage of the worms as the more complicated baits containing all the ingredients used in the regular grasshopper bait. A bait made in the following proportions proved very effective, when spread at the rate of 10 to 20 pounds per acre: Wheat bran, 25 pounds; Paris green, 1 pound; water to make a crumbly mash (about 3 gallons).

The Paris green and dry bran should be mixed thoroughly and water then added gradually and mixed in until an even crumbly mash is obtained. It is possible that further experiments will show that the addition of two quarts of stock molasses to the above formula, and perhaps also lemons, is desirable under certain conditions. The bait made according to the above formula, however, did such good work where tried that it seems a waste of time and expense to add the flavoring unless it is found later that their addition makes the bait more effective. The mash can be mixed in a large box, tub, trough, or on a large canvas spread flat.

When an area of any size is to be covered, the bait can be spread very rapidly and easily by using a grain seeder mounted on a wagon in the usual way. This bait has been spread many times in fields where cattle and sheep were grazing with absolutely no injury to the stock. Precautions should of course be taken not to allow the bait to fall in lumps of any size or to leave quantities of it in places where children or animals can have access to it.

The cost of this poison, applied as recommended above, is about 50 cents per acre, not counting the labor of mixing and spreading. The ingredients can be purchased almost anywhere. The prompt application of this poison should enable farmers to save many times its cost in increased yields of grain and pasture forage. Not only would the crop of the current year be saved, but the number of worms likely to hatch and do damage the following year undoubtedly would be considerably reduced.

New Discovery May Change Fertilizer Industry

WHAT may prove to be a revolutionary development in the fertilizer industry of the world has been reached by the bureau of soils, United States department of agriculture, which has just solved the problem of extracting phosphoric acid from phosphate rock by heating mixtures of this mineral, sand and coke to a smelting temperature in a fuel fed furnace. The new process has been worked out on an approximately commercial basis at the department's experimental plant at Arlington, Virginia.

The phosphate used for fertilizer in the United States comes largely from the deposits of rock in Florida. There are also large deposits in Tennessee and a number of beds in South Carolina where the rock was first exploited for this purpose. The established method for producing soluble phosphate has consisted in treating the rock with sulphuric acid. In practice, a quantity of sulphuric acid equal to the quantity of rock is used, and the resulting product, which is known as acid phosphate, contains only one-half the percentage of phosphoric acid contained in the rock from which it was derived. Commercial acid phosphate, for instance, made from a 32 per cent rock contains only 16 per cent of phosphoric acid. The elaborate washing and screening process now used in preparing phosphate rock for treatment with sulphuric acid often results in the loss of two-thirds of the rock, and it was with a view to saving this immense waste of phosphate that the new process was evolved.

The United States department of agriculture has been experimenting for some time along the lines of freeing the phosphoric acid by means of a high degree of heat. It was the first to adapt the Cottrell precipitator to the collection of phosphoric acid, the apparatus having been previously devised by Dr. Cottrell to abate the smoke nuisance and to recover sulphuric acid from smelting operations. The first work was done in an electric furnace which was thought to be required to generate the high degree of heat necessary, about 1,600 degrees Centigrade, or 2.900 degrees Fahrenheit. At this temperature mixtures of phosphate rock, sand and coke were reduced to a molten slag which was tapped off at intervals, the phosphoric acid escaping in the form of fumes which were afterwards collected in a liquid or solid form.

It soon became evident that this process would be prohibitively expensive with an electric furnace, except in localities where electric power could be obtained at a very low cost, about $25 per horsepower a year, and the department therefore turned its attention to the possibilities of using crude oil, the cheapest fuel obtainable in the vicinity of the large phosphate rock deposits of Florida. The efforts have recently met with success, and figures kept on the experimental runs at Arlington indicate that phosphoric acid can be extracted more cheaply in an oil burning furnace than by the old sulphuric acid process.

One problem which department scientists have worked out is that of keeping the fuel in direct contact with the rock material until the reaction is well started. For this purpose, and for convenience in handling, the material is briqueted with coke and sand. Briqueting keeps the coke fuel within the mass and retains it until the reaction is well started. Sand or silica is necessary to bring about the chemical reactions, and this sand is largely present as an impurity in the Florida phosphate deposits, together with a clayey ingredient which acts as an excellent binder in making the briquettes. Thus the very impurities which make rock objectionable under the old process are turned into an asset.

The practical value of the new development is indicated by the fact that in the experimental runs at Arlington the department chemists were able to recover a 64 per cent phosphoric acid, as against the 16 per cent product ordinarily obtained by the sulphuric acid process. By passing ammonia gas into this phosphoric acid, solid ammonium phosphate, a very concentrated material containing two valuable fertilizer ingredients, results. This material can stand heavy transportation and handling charges. It is also practicable to mix the phosphoric acid with phosphate rock in such proportions as to give a product containing 50 per cent of soluble phosphoric acid. This product is similar in its properties to ordinary 16 per cent acid phosphate, is convenient to handle, and may be used by an intelligent farmer who has the technical knowledge to reduce the quantity placed upon the soil and to guard against direct contact with seed. It also will permit a material saving in freight to central plants where the product may be diluted or mixed with other ingredients for shorter hauls. The difference between a 50 per cent product and a 16 per cent product means an immense saving in the freight charges and the release of large quantities of rolling stock and vessel tonnage now engaged in the transportation of phosphate and phosphate rock.

While the actual cost of the new process in a large industrial plant is difficult to estimate with accuracy in the work thus far done, even on a small scale, it was found that the fuel consumption was only about 15 per cent of the value of the product, while with the sulphuric acid process the cost of the acid used seldom runs below 22 per cent. This factor, together with the reduction of freight charges, justifies the assumption that the new process will be of the utmost importance to the fertilizer industry and to the farmers who are compelled to use a constantly increasing amount of commercial fertilizer.

EXPOSITION REVIVED

The former management of the Panama-Pacific Exposition is reviving memories of the "Dream City" through a prospectus announcing the publication of an official history of the exposion. The book, or rather books, for there are to be five volumes, is to cost $30. The prospectus contains five of the color plates which will appear in the finished work. Each of the five volumes is to contain 560 pages of text.

THE SECOND-FOOT

"Second-foot," as defined by the United States geological survey, department of the interior, is an abbreviation for cubic foot per second and is the unit for measuring the rate of discharge of water flowing in a stream one foot wide and one foot deep at a rate of 1 foot per second. It is generally used as a fundamental unit in measurements of stream flow.

"Second-feet per square mile" is the average number of cubic feet of water flowing per second from each square mile of area drained, on the assumption that the runoff is distributed uniformly both as regards time and area.

An "acre-foot" is equivalent to 43,560 cubic feet and is the quantity required to cover an acre to a depth of one foot. The term is commonly used in connection with the storage of water for irrigation.

A flow of one second-foot equals 7.48 United States gallons a second, 448.8 gallons a minute, or 646,317 gallons a day. As a California "miner's inch" equals 0.187 gallon a second, there are 40 California miner's inches in one second-foot.

Clear Out The Old Trees

"No need to hire four or five men to clear out that old orchard. It's a cinch to blast out the old trees with dynamite. Looked like a long job by the old methods, but no more cutting and stump grubbing for me!

"I blast them out, roots and all, with

HERCULES
FARM DYNAMITE

"We use dynamite for all sorts of work—planting trees, digging ditches and post holes, clearing land, cultivating our bearing orchards and doing a hundred other things. Never knew there were so many ways to save labor on heavy ranch or orchard work until I sent to the Hercules Powder Co. for a copy of their 68-page book, 'Progressive Cultivation'."

Send for this book. It'll help you to improve both your ranch or orchard and your bank account. Sign the coupon and mail it *today*.

SAFE TREE SPRAY MATERIALS

B T S is a patented Dry Sulphur and Barium Compound in which all of the Sulphur and all of the Barium are available as active ingredients. **THE VALUE OF B T S IS NOT LIMITED TO THE SULPHUR CONTENT.** It is a stable compound which dissolves readily in water and does not clog the nozzles. It is convenient, economical, and effective. B T S controls Leaf Curl, Twig Borer, Red Spider, Apple and Pear Scab, and may be safely combined with Orchard Brand Arsenate of Lead.

Orchard Brand Arsenate of Lead Paste is the standard spray for effective and satisfactory control of Codling Moth. It is of maximum concentration and safe to use. It is a soft, creamy paste so manufactured by chemical exactness and mechanical processes as to give the best possible results under orchard conditions.

Orchard Brand Dry Powdered Arsenate of Lead is double the strength of the Paste. It is a finely divided powder that mixes readily with water and remains in good suspension when diluted in the spray tank.

Atomic Sulphur is the best known safe and effective spray material for the control of Powdery Mildew. It may also be combined with Oil sprays and Nicotine to prevent Scab developments when spraying for Thrips control.

Miscible Oil No. 2 and **Distillate Oil Emulsion** are highly considered penetrating, effective oil sprays for the control of Thrips, Aphis, etc., and may be combined with Orchard Brand Arsenate of Lead and Atomic Sulphur.

Bordeaux Mixture, the standard fungicide, properly combined to give the greatest efficiency.

A full line of essential spray materials for California Fruit Growers' needs, manufactured under most careful supervision by thoroughly trained and experienced men.

Our Entomologist, Mr. S. W. Foster, will be glad to furnish the best available information regarding the control of the important orchard insect and fungus pests. When writing please give variety and age of trees.

DECIDUOUS FRUITS

These are the actual prices obtained February 21, by the Los Angeles wholesalers in sales to retailers, peddlers, hotels, restaurants, cafeterias, etc. Terms Cash on walk.

Apples: Supplies liberal, movement good, market firm. California: Bushel boxes Bellfleurs, fancy 4 tier best 2.35 2.50; ordinary, 2.00@2.10; 4½ tier, 1.85 @2.00; Jonathans fancy 3.00@3.50. Delicious fancy 3.00@3.75. Rome Beauty, fy., 2.75@3.25. Idahos and Utahs: Loose Jonathans. Romes and Arkansas Blacks, best mostly 6@7 per lb. Oregons and Washingtons: Bushel boxes, extra fancy **Jonathans and Spitzenburg mostly 3.00** @3.40.

Pears: Various varieties, 6@10.

CITRUS FRUITS

Grapefruit: California, per box, market pack, 2.00@2.75; special packed brands, 2.50@3.00; Imperial bx., 4.25@5.00; Arizonas, 4.25@4.50.

Lemons: Market dull, wide range in prices: Local stock: Packed, box, 1.50 @2.25, few high as 3.00; loose, bx., 75@ 1.00 lug mostly 40@50.

Oranges: Supplies heavy, market dull. Navels market pack large size 2.50@ 3.00; small low as 1.75; special brands mostly 3.00@3.75 according to size and quality, packing house culls, 25@85 box; few large size 1.00. Tangerines, best, 6@8 lb. small, 5.

HONEY

Supplies heavy. Demand slightly improved. Movement slow, market weak, prices lower. Prices and quotations f. o. b. usual terms: White orange blossom, 14@15, some high as 18; White Sage, 12@ 14; White Alfalfa, 12, Light Amber, 7@ 11, Light Amber Sage, 11@12; White Hawaiian 8, Light Amber Hawaiian 6. Beeswax: in l.c.l. sacked 33@35. Shippers expect lower prices, especially on dark honey which is said to compete with sugar. A large crop expected here account of recent rains.

WALNUTS

California Walnut Growers Association's prices: Soft Shell, No. 1, 22½; Soft Shell, No. 2, 16½; Budded, fancy, 26½; Budded, standard, 22½.

GRAIN AND FEEDS

Grain Exch. price bid February 22:
Milo: Carlots, 1.92½; No. 2, Eastern blk, 1.65.
Corn: Bulk, No. 2 Yellow, 1.65.
Bran: Kansas, 32.75.
Barley: 1.35@1.37½.

HAY

Alfalfa Growers of California report under date of February 21:

Receipts during the week were maintained at the normal rate quantitatively, but qualitatively those of high grade were smaller and of the lower grades considerably larger. Prices for the high grades remained on practically the previous level, while the lower grades sold at a widening discount. The milk supply of the cities of the state has for some time shown a steady increase and this growth still continues. Normally this would also mean a much larger consumption on alfalfa hay, which, however, is as yet not as pronounced as it would be if other feeding stuffs were not so abnormally low in price and therefore are temporarily used on a larger scale than usual. Cotton meal, for instance, is at present quoted at $28 per ton as against $70 last summer, and corn is being shipped into the state in large quantities from as far East as Kansas and Nebraska, in spite of the enormously high rates of freight. This abnormal condition can of course not continue for very long, as the prices are absolutely ruinous for the producers. The Eastern markets for corn, oats, etc., have lately stiffened up some and a moderate further advance would undoubtedly stop shipments to here. A newspaper article from Riverside last week quotes the statement of the manager of a large orange grove that "alfalfa at $25 a ton is chapear than stable manure" and that he expects to use 15,000 tons of alfalfa as fertilizer this year.

There were 1,100 tons received on the tracks in Los Angeles the week ending February 12, with 200 tons held over as against 900 tons the week before.

Rabbit Alfalfa	36.00
No. 1 Dairy	24.00
Standard	21.00
Stock	16.00

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

Tame Oats	20.00@24.00
Barley	18.00@22.00
Alfalfa	18.00@26.00
Barley straw	8.00@12.00

San Francisco Markets

San Francisco, February 22, 1921.

Quotations made daily by San Francisco Wholesale Dairy Produce Exchange. These are the prices paid by retail grocers to wholesalers. The prices paid by the wholesalers to producers are eight per cent less.

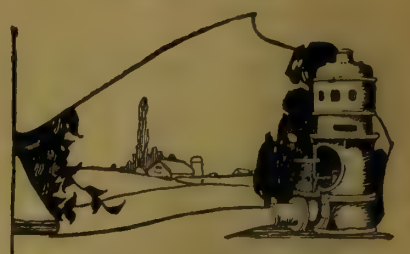
Byron Jackson Service



WHEN you buy a Byron Jackson deepwell turbine your purchase includes Byron Jackson service.

A service built on an engineering foundation that goes back to the very beginnings of irrigation in the west.

Starting in the factory testing department, this service accompanies the pump through the installation and down through the years of operation by means of a state-wide system of service cars.

Your water development problem is assured prompt and expert attention in our engineering department

The Diener Tomato

Increase your tomato yield one hundred per cent by raising the new DIENER TOMATO. 30-40 tons of ripe fruit to the acre.

This tomato was raised last year all over the United States and Canada with the greatest satisfaction.

As smooth as an apple and of a magnificent dark red color. Single tomatoes weigh up to 3 lbs. each. The flesh is more solid than that of any other tomato. The fruit contains very little seed and is solidly filled out. This tomato is free of the acid taste, and for dehydrating, catsup, and canning it is the best tomato in existence today.

The DIENER TOMATO is blight-resisting as well as drought-resisting. It will not crack from the rain and will not rot while lying on the ground in wet weather. This tomato will grow in almost any kind of soil and it commences to ripen the first part of August.

It is the greatest novelty in the tomato line, and it will soon crowd out the present varieties from the market by its far superior qualities.

Price of the DIENER TOMATO SEED: Sample pkg., 25c; one-quarter of an acre pkg., 50c; one acre pkg, $1.50.

Our 1921 CATALOGUE, describing our many other novelties in flowers and grains, is free on request.

Citrus Markets

Los Angeles, February 23, 1921.

Oranges are not commanding prices which are entirely satisfactory to the grower. Large number of small sizes are being turned over to peddlers at prices which leave but little to the grower. When f. o. b. California sales are made they are around $1.50, while 150's and larger will hold around $3.00@$3.50.

Lemons have sagged again and some sales have been made which left nothing whatever for the grower. Growers are becoming discouraged and desperately tired of guaranteeing freight charges which are so excessive as to leave no chance whatever for the growers' profit.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 7,027 cars; lemons, 1,827; total, 8,854. To same date last season: Oranges, 7,446; lemons, 1,688; total, 9,134. From Central California to date, this season: Oranges, 4,023; lemons, 88; total, 4,111. To same date last season: Oranges, 3,449; lemons, 216; total, 3,665. From Northern California to date this season: Oranges, 305; lemons, 4; total, 309. To same date last season: Oranges, 261; lemons, 22; total, 283.

Tulare County Reports Excellent Results From Use of AGRI GYPSUM

READ WHAT A USER OF 200 TONS SAYS:

Tia Sallita Orchard Co.
K. E. Johnson Orchard
Ernestine B. Young Orchard
Arthur G. Tasheira Orchard
H. Spens-Black Orchard
Wobber Brothers Co. Orchard

Lindsay, Calif., Feb. 12, 1921.

United States Gypsum Co.,
902 Citizens National Bank Building.
Los Angeles, Calif.
Dear Sirs:

Referring to your letter of February 4th, as to my use of Gypsum—I have used it on citrus orchards at intervals for ten years and last season used over 200 tons of your AGRI Gypsum on foothill and valley orchards of various soils and conditions. I believe the benefits derived have been excellent in every case and especially so on the heavy foothill soils.

Sincerely,
McKee Mhoon.

Grove owners, ranchers, gardeners and others are testifying to the splendid results through the use of AGRI GYPSUM. It supplies the elements generally deficient in California soils.

Many tests are recorded where applications of gypsum increased alfalfa crop production 300 to 400 per cent. It is highly beneficial to oranges, barley, potatoes, truck and other crops with heavy foliage.

Ask your dealer for AGRI GYPSUM and you will be sure of the product ground fine to do the most good with the least amount used. If your dealer cannot supply you, write

UNITED STATES GYPSUM CO.

Wonderful New Hay Crop
SUDAN GRASS

First Introduced into the U. S. in 1909 from the Sudan in Africa. Tests by the department of agriculture have proved it to be of the greatest value in the Southern and Western states, where rainfall is deficient.

Culture—Sudan Grass is strictly an annual. It may be drilled or broadcasted. If drilled 8 to 12 lbs. per acre is ample; for broadcasting 15 to 25 lbs. should be used. It grows 8 to 10 feet high and yields from 3 to 8 tons per acre. You are sure of two cuttings, and if irrigated three or four cuttings.

Sudan Grass for Pasture—During the months of August, September and October all other grasses are dry, then is the time Sudan is most valuable for fall pasture, and by having it fenced in small fields it will yield food for six times as much stock as any other forage will without irrigation. For milk cows and hogs, there is no better and more abundant pasture than Sudan Grass. It will solve the hay proposition as nothing else can or will do in this climate. A good silage and balanced ration. This seed was grown on our own farm, and is free from Johnson Grass.

Price Per Pound:
10 lb. lots, 20c 100 lb. lots, 15c
250 lb. lots, 12c 500 lb. lots, 12c
1000 lb. lots, 10c

ALFALFA WEEVIL WARNING

The recent jump of the alfalfa weevil from the Rocky Mountain states to Malheur County, Oregon, and to Washoe County, Nevada, only 20 miles from the California line, but seems to emphasize the necessity of extreme watchfulness on the part of California agriculturists to prevent its introduction or to stamp it out in case it should become established in this state.

This pest is a most dangerous one, and an outbreak in California would be a serious blow to our alfalfa, dairy and livestock industries. In the Rocky Mountain states it takes about half the first crop and the second crop is eliminated entirely, the larvae, after the first crop is removed, dropping down on the ground and feeding on the young shoots as fast as they appear above the surface, with the result that the field remains bare and brown. In California, with our milder climate, it is easily possible that even the later crops, too, would be taken. Control is very difficult and expensive, consisting of dragging the fields with a spring-tooth harrow or brush drag, cultivation with a disk and spraying the alfalfa fields with arsenate of lead.

The state department of agriculture has taken every precaution to prevent the introduction of this insect into California through rigid quarantines. In addition we have made frequent and careful inspection of the alfalfa fields adjoining railways coming direct from infested areas, where it is presumed it would most likely put in an appearance first.

The adult weevils are small brownish snout beetles about one quarter of an inch in length. Eggs are small and yellow and laid in clusters within the hollow of the stem through a puncture in the side. The larvae, appearing in the fields from April to November, are about one-half inch in length when full grown, grass green in color with a lighter longitudinal stripe down the back. They feed on the leaves, leaving the ribs untouched to a large extent.

All inspectors, stock men, dairy men and alfalfa growers are requested to be on the lookout for this pest in their fields and to send any supicious insects to Pest Control Service, State Department of Agriculture, Sacramento, for examination.

BEET GROWERS PLAN NATIONAL ASSOCIATION

Beet growers from nine states, Ohio, Michigan, Indiana, Illinois, Wisconsin, Iowa, Nebraska, Colorado and Utah, were represented in the conference called by J. R. Howard in Chicago on January 17 and 18. C. H. Gustafson, new head of the American Farm Bureau Federation cooperative marketing department, was chosen chairman of the meeting and James Clemmens, Kansasville, Wis., secretary. The plan of organization adopted by the United States Beet Growers' Federation was recommended to the American Farm Bureau Federation as a plan for organizing a national sugar beet growers' association.

A nationally uniform contract was recommended as follows: "The price per net ton of beets shall be based on the average seaboard net price of beet sugar during the year beginning March 1, 1921, said average price being arrived at by adding together the prices of beet sugar as quoted and reported by Willett Gray, New York, for each working day of said year, and dividing such total by the number of said working days. Initial payment will be made on the 15th day of each month for beets delivered during the previous month and will be as high as sugar prices warrant. Further payments will be made from time to time as the net selling price of sugar may justify. The final payment will be made on March 15, 1921.

INTERCROPPING WITH COTTON IN ORCHARDS AND VINEYARDS

Cotton as an interplanted crop is finding much favor in the San Joaquin Valley. It seems to be especially well adapted for use in first year vineyards or in young orchards. In Circular 164, issued by the United States department of agriculture, a representative of the bureau of plant industry reports that a Kern County farmer planted cotton between young apricot trees which were making their third year's growth. From about two acres of orchard land he harvested nearly $500 worth of cotton in 1918. The cotton plants occupied only 1.27 acres of the entire plat. In this instance the farmer was enabled to pay the upkeep costs of his orchard with the proceeds from his cotton and to pocket a good profit in addition.

Another farmer in the same county set out 12 acres of grapevines and interplanted with two rows of Pima (long staple cotton) placed between each two rows of the vines. He obtained a yield of nearly a bale to an acre. At the end of the season his vines were in an excellent condition, only one being lost in the entire lot. Specialists say the practice is a profitable one; the cotton is as good as when grown alone, and the young grapevines are equal in every way to those grown without an intercrop.

COMING EVENTS

Eleventh National Orange Show, San Bernardino, February 18-28. General Manager, F. M. Renfro.
California State Beekeepers Association, Oakland, March 2-5. Secretary, A. B. Shaffner, 4232 West First St., Los Angeles.

Siskiyou County Fair, Yreka, October 9-15.
Southern California Fair, Riverside, October 8-16.
Los Angeles Livestock Show, Los Angeles, October 16-25.
California Horse Breeders' Association, Los Angeles, October 30 to November 5.

MARIOUT BEST BARLEY FOR BUTTE

The best barley to plant from now on is Mariout, declares H. E. Drobish, Butte County agent, who says Mariout barley will mature in from two to three weeks' less time than will common barley. For spring planting it has been clearly demonstrated in Butte County that Mariout barley will outyield common barley.

Last year in the farm bureau demonstations on over 20 farms in the county, Mariout barley yielded on an average of from 40 per cent to 50 per cent more per acre than did common barley. Careful checks were kept in each case. The increase in yield was especially marked in those planted after January 1.

A Tractor that meets every requirement of orchard work

CATERPILLAR
Reg. U.S. Pat. Off.

5-TON ORCHARD TRACTOR

Here, in the famous 5-Ton "Caterpillar" Tractor, is an orchard tractor that solves your particular power problems — fully meets your special needs.

It has power — big power — and that's your foremost essential. With the 5-Ton you can plow or subsoil deep, finish up your work quickly, keep a safe distance away from the trees.

And the 5-Ton's power is compact power—the tractor is narrow, low-down, has clean, smooth lines, with nothing projecting to knock off fruit or catch low-hanging limbs. "Caterpillar" 5-Ton Tractors' wide range of speeds —1½, 3 and 5¾ miles per hour —gives it splendid versatility, makes it adaptable to a wide range of work. The 5-Ton turns short, pivoting on either track.

Most important of all are the factors of long life, low upkeep cost, low operating expense, in which the "Caterpillar" 5-Ton Tractor holds a position of superiority not even approached by any other orchard tractor—a position established by its achievements, on two continents, in every kind of work, under every conceivable condition.

Investigate this Tractor now. Every day that you wait delays your profiting by this Tractor's ability to decrease your orchard costs.

There's only one Caterpillar Holt builds it

Hatching With Hens

By Jean A. Koethen

THE hen mother is like the little girl in Longfellow's rhyme:

When she was good she was very, very good,
And when she was bad she was horrid.

The best hen is the perfect hatcher; no incubator is her equal. The worst hen is worse than any incubator. Between these two extremes there are many grades and varieties, some better, some worse. I have had hens that killed two-thirds of the germs and chicks before the hatch was complete, and others that could almost hatch a china door knob.

Because of this uncertainty—or perhaps you would call it temperament—in hen psychology it is a good plan to set two or more hens at the same time. Then, if one proves too temperamental it may be possible, after testing out on the seventh or eighth day, to let her go and give all the fertile eggs to the other. Again, at the end of the hatch the broods may be doubled, for one hen can easily care for from 15 to 20 chicks if she is properly protected, and a good hen will more successfully hover 20 than a poor one six.

The first step in hen hatching is to get your hen. When a hen shows a disposition to stay on the nest, leave her alone for two or three days. Some hens settle down much more quickly than others. There are some that can be moved from the nest in which they have been laying to that in which they are to sit at any time of the day or night, and others that can never be moved without a long and violent struggle to accustom them to the new nest. As a rule the older hens settle down more quickly. A young hen is flighty and must be coaxed and humored.

It is usually safer to move the prospective sitter to the new nest after dark. Sometimes this precaution seems to have little effect, but as a rule the hen will quiet down more quickly in the dark. If the eggs are ready, it is entirely unnecessary to break the hen to the new nest before they are put under her. My own plan is to have the eggs in the nest when the hen is moved. She is put on them and covered so closely that she cannot readily stand up, allowing, of course, abundant ventilation, and here she is left two whole days. The third morning I remove the cover, having first placed grain and water beside the box, and she is free to get off when she pleases, but I keep my eye on her, and when she has been off ten minutes or thereabouts, steer her back to the nest and cover her again. The second time she is let off she can usually find her way back, but I watch and make sure she does not stay off too long.

My experience with sitting hens has perhaps been different from that of poultry writers who insist the hen must be so accustomed to the nest that she will return to it after eating before the eggs are given her. A hen knows the difference, I believe, between a real clutch of eggs under her breast and a sample two or three, and will settle down when she feels the real thing. Being a hen, however, she is slow in learning new places and must be watched until she has adjusted herself to the new surroundings.

Dust the Hen

No hen should be set without a thorough dusting with some good insect powder, and a second dusting before the eggs begin to pip is a safe precaution. Not all hens are lousy, but all may be.

We have been told that hens should be set on the ground. Theoretically, I suppose, the moisture of Mother Earth has value, but a hen is more easily controlled in a box, and moist earth can be put in the box under the nest litter if it is desired. I used to be more particular about dirt in the bottom of my sitting boxes than I am now, but I could never see that anything was gained by putting it in, except that it made a good, firm foundation for the straw or hay. Whether dirt is used or not, the nest should be deep and well rounded so that the hen can support herself without resting her weight on the eggs. She must be comfortable or she will become restless and break the eggs.

Regular Meals

After the first two days the sitter should leave the nest every day to eat and dust. If she does not get off of her own accord she must be taken off. One of the first hens I ever set nearly starved because I did not understand this. I thought she would get off if she wished to and congratulated myself on her remarkable fidelity to her maternal duties. When at last, on the advice of a neighbor, I took her off, she could not stand and could hardly eat.

Not only is the regular daily meal necessary to the strength and heat of the hen, but a short airing is just as necessary to the germ. The close sitter is not the best sitter. As the period of incubation draws toward its close the eggs need more and more airing and the hen will be seen remaining off the nest for longer and longer periods.

The first week of incubation the germ is easily killed by chilling, but during the last week the eggs may be left uncovered for a number of hours without harm. Instances are on record where hens have apparently been off all night, and still the eggs hatch. A hen will rarely desert her nest if she is kept free from mites and lice, but if she does the eggs need not be wasted. Keep them as warm as possible till another hen can be found to cover them. If no other hen is available, and hatching time is near a fair hatch may sometimes be achieved by wrapping in flannel and keeping them in the sun or in a warm place in the house.

Testing Out

Eggs that are under hens should be tested the seventh or eighth day and the fourteenth and fifteenth in order to remove all infertiles and all dead germs. At the first testing all clear eggs are removed while they are still fit for use. At the second testing germs that have died after the first testing are removed. If they are left to rot they may be the cause of the death of chicks that are nearly ready to pip the shell. Oxygen is so necessary to the strength of the chick that sulphur dioxide fumes from a single rotten egg may work considerable harm.

A great many amateur poultry people are very careless about testing out, reasoning, no doubt, that the clear egg may as well remain under the hen as anywhere else. They forget that the more eggs a hen is obliged to cover the greater the likelihood that one may be chilled. They also forget that an egg is worth a nickel more or less. A clear egg that has been under a hen a week is as good for cooking as a cold storage egg, and if one is not too fastidious, may be used on the table. The yolk may run a little, otherwise it is hardly stale.

Beware of Mites

The sitter has no greater enemy than the little red mite (dermanyssus gallinae). They are a terrible plague to the hen that is able to move around and dust herself, but to the sitter whose instinct binds her to the nest they are torture and death. They suck her blood, and she is helpless to resist them. In January and February, if the weather is normally cool, clean boxes and litter are the only precautions necessary to keep mites away, but when the warm spring days come special care must be employed. Soaking the box with kerosene will keep mites out, but if the kerosene touches an egg it is fatal to the germ. Tobacco leaves or stems or dust in the nest litter, or any louse powder containing tobacco, is death to mites. The wise caretaker will examine the nest from time to time when the hen is off, not only for broken eggs but for lice. If tiny black specks are seen moving about on the eggs there is nothing to be done but to wash the eggs in warm water and prepare a new nest that is mite proof. To permit a hen to die from mite infestation is cruelty that deserves the attention of the S. P. C. A.

Dr. LeGear says

"Your chicks need help the first few weeks."

Save your chicks! The first few weeks is a critical period. Build up their vitality to resist diarrhoea, bowel trouble and leg weakness. Do this with Dr. LeGear's Poultry Prescription. It has saved the lives of millions of chicks.

It also helps to make hens lay and keeps poultry vigorous and healthy.

An Egg in February Worth Two in May

Egg prices are still high—and will remain high until the usual spring lowering of prices. So help your hens lay NOW as steadily as they do in springtime—have lots of eggs to sell *at winter prices.* It's easy! Add

Pratts Poultry Regulator

to any good ration. Then watch your birds start filling the empty nests.

One egg *now* is worth two in May. And Pratts Poultry Regulator surely coaxes the eggs along. Thousands of poultrymen have proved that during the 50 years this wonderful egg-tonic has been on the market. Test it on your flock. Do it *now.* The longer you delay, the more you lose. You risk nothing because—

LET your chick babies be buttermilk babies this year and watch 'em thrive and grow. Start them right, start them on Globe "A-1" Baby Chick Mash, **the buttermilk baby chick mash.**

There is practical and scientific knowledge put into Globe "A-1" Baby Chick Mash. It isn't just a feed. It's that and more—a health protector. The generous quantity of pure dry buttermilk which it contains gives it this invaluable property. The lactic acid content cleanses the baby chick's system, and protects it from the ravages of disease. **(It has proved a preventative of white diarrhoea and coccidiosis).**

AFTER THE CHICKS ARE OLDER

After your chicks are about 6 weeks old change the ration to Globe "A-1" Growing Chick Mash (containing dry buttermilk) and when the pullets are 5 months old begin to feed Globe "A-1 Laying Mash (containing dry buttermilk) and get ready for the full egg basket.

Nutritious hearts of grain, meatine, selected ground grains and plenty of pure dry buttermilk—that's Globe "A-1" Baby Chick Mash—why shouldn't the chicks grow well on it?

GLOBE A-1 GUARANTY

"Money's Worth or Money Back"—a guarantee as sound and as liberally made as are Globe A-1 Feeds. If you are not pleased to have our Product, we are not pleased to have your money.

Poultry Queries

Conducted by J. A. Koethen

Wyandotte Weights

Will you please give me the standard weights of Wyandottes?—Subscriber, Ducor.

Standard weight for Wyandotte cock is 8½ pounds; cockerel, 7½; hen, 6½; pullet, 5½.

Moistening Duck Eggs

Please tell me if duck eggs have to be dipped into water daily while incubated by hens.—Subscriber, Bakersfield.

It is not necessary to moisten duck eggs at all when they are under hens, but most people do sprinkle them occasionally with warm water. A hen will often bring off a good hatch without any moisture except that from her own body and the outside air, but it is safer, especially if the weather is dry, to sprinkle, say, once a week the first three weeks and two or three times the last week.

Cottonseed Meal

Will you please tell me if cottonseed meal is good for chickens, and has it any effect on the egg? Subscriber, Glendale, Arizona.

According to the latest feed letter from the poultry division, either cottonseed meal or cocoanut or soy bean or linseed meal may be used in the mash, ten pounds of the meal to 200 pounds mash. They are all similar in their effect, which is to add considerable vegetable protein. Linseed and soy bean meal are preferred, but cottonseed may be used if more convenient.

Cement Floor

Is a cement floor in a poultry house a good idea in Southern California, and how will chickens thrive on it?—G. T. H., Compton.

A cement floor is considered the very best, and some of the most up-to-date ranches have them. It is not too cold if covered with sand. Generally a layer of straw is spread on top of the sand and removed when it becomes filthy.

Venetian Red

What effect will Venetian red have on laying hens? I have been told that keeping it in the drinking water keeps them healthy and increases egg production.—L. E. P., Burbank.

I have a dim recolection of having seen Venetian red prescribed for some poultry disease, but do not remember what nor why. The way to keep hens healthy is to keep them and their quarters clean and feed plenty of green feed. The way to increase egg production is to keep their vigor up to the highest notch and provide all materials for egg manufacture.

Roup

Will you kindly answer the following questions in your magazine: How can I tell if my chickens have cold and roup? Can I cure it? If so, how? What shall I do if many of the flock are affected? What is the cause of roup?—Subscriber, Norwalk.

There is material in these questions for a detailed discussion which I shall try to give soon. Briefly, we call a running at the nostril or rattling in the throat a cold, while a thick, nasty-smelling discharge or swellings under the eyes or eyes sticky or swollen shut indicate roup. The difference is more in degree than in character. The simplest treatment is dipping the head of the affected bird in warmish water to which a few crystals of potassium permanganate have been added. Before dipping massage the nostrils in order to loosen the secretion and open the swellings under the eyes. Then dip the head under while you count ten or longer if the bird will stand it. Repeat this treatment morning and night, preparing the solution fresh each time. The above is a treatment, but not a cure, for the only cure is removing the cause, and the cause of roup is dampness and filth in houses and runs. More often than not, lack of ventilation is the real cause, for if a flock is shut up at night in a tightly closed house the moisture from their bodies makes the air damp. Every chicken house should have an open front and the birds should not be crowded. If houses and yards are kept dry and clean and roosting quarters well ventilated there will be very little roup in any flock. If there are many cases it is almost proof positive that sanitary conditions are bad, and the first thing to do is to clean up. Hens that roost in trees never have roup. It is only artificial and unsanitary methods of housing that produce it.

Vent Gleet

Our 22 hens are having something like piles. Is it caused by excessive laying, and what is the remedy?—Subscriber, Puente.

I wish you had described the disease more fully. "Something like piles" might mean several different things. My first suspicion is that they have vent gleet, which is an infectious disease, and usually, if not always, spread in a flock by the male bird. Here is Dr. Salmon's description of vent gleet: "The first symptom observed is the frequent passage of excrement which is voided in small quantities almost as rapidly as it reaches the cloaca. Often the bird endeavors to drop excrement when the cloaca is entirely empty. If an examination is made the mucous membrane is found in the early stages to be red, dry, swollen and hot. In a day or two a discharge makes its appearance. It is at first thin and watery but soon becomes white, purulent and offensive. This discharge collects upon the skin and feathers, obstructs the passage and irritates the parts with which it comes in contact. The soiled skin becomes red and inflamed, it may be abraded by friction or by the bird picking at it, and thus sores or ulcers are started which may become quite troublesome." To treat, isolate affected birds and give 30 grains Epsom salts. Twice a day inject first a four per cent solution of cocaine and immediately afterward a solution of nitrate of silver four grains to the ounce. The fifth day commence a small copaiba capsule daily and inject acetate of lead, one dram to the pint. Feed low and dust sore places outside with iodoform. The hands must be washed thoroughly after handring a bird with this disease, for it is very infectious. If the condition of your birds does not answer the above description it may be they have inflammation of the oviduct, but it hardly seems likely that more than one or two in a flock would have this trouble, which comes from the breaking of an egg in the passage, or from severe straining in laying.

DODDER

The federal department of agriculture has issued in Farmers Bulletin 1161, "Dodder," a most complete treatise on this pest. The bulletin is filled with illustrations and descriptive text regardng the pest. The summary is:

Dodder is a parasitic plant, infesting clover and alfalfa chiefly. It is a bad weed in Europe, though conditions in the United States are not as favorable as in Europe for damage by dodder; hence the appearance of the pest on the farm should not occasion undue alarm. Nevertheless, dodder may cause a great deal of damage, and it should not be allowed to grow unmolested.

Dodder is usually introduced on the farm by impure seed. Other means are infested hay; moving objects, such as animals and wagons; irrigation water carrying seeds and pieces of stem; and viable dodder seeds contained in stable manure.

Dodder seed, with the exception of that of large-seeded dodder, may be cleaned from impure clover and alfalfa seed by screening. It is practically impossible to remove large-seeded dodder by screening. The seeds of field dodder are also difficult to remove entirely from clover and alfalfa seed.

During the first season of infestation in clover or alfalfa, dodder usu

ally occurs in small scattered areas. Such infested areas should be either mowed or removed before the dodder matures seed or else burned in the field. If seed has formed, burning is the only remedy, since it kills not only the plants but also any seeds of dodder which may be lying on the soil surface.

If the infestation is so great that patch treatment is impracticable, the crop may be either plowed under or utilized for hay and the aftermath closely grazed to prevent seed from forming. Sheep are especially useful in grazing dodder. If dodder seed has formed and the crop has been very seriously damaged, the safest method is to cut the crop, allow it to dry, and burn it in the field.

Dodder does not attack cereals; consequently oats, wheat, etc., should be incorporated in the rotation following the infestation of the soil with dodder seeds. A tilled crop, such as corn, will cleanse the soil of most of the dodder seeds. In place of clover or alfalfa, other legumes, such as soy beans, velvet beans and cowpeas may be grown, since dodder never damages any of these crops. The seeds of dodder in the soil may remain viable for a period of five years or longer.

A number of cultivated crops besides clover and alfalfa are subject to dodder infestation; the most important of these are sugar beets, onions and flax.

CALIFORNIA EGG CONTEST

During the ten day period from February 1 to 11 the 540 contesting hens in the California farm bureau egg laying contest laid 3677 eggs, or an average production per day of 68 per cent. At this time last year the 1919-20 contestants were laying 47.5 per cent, or 21 per cent less. Three pens for the last ten days go over the highest mark made at any time during last year's contest and five pens tie highest record made during last year. Eight pens average better than 80 per cent for the ten days and 23 pens go better than 75 per cent.

High records for the ten days are: Hanson's Poultry Farm, 85 eggs; D. B. Walls, 81; Hollywood Farm, 81; W. A. Ford, 80; Warren Wood, 80; C. E. Hyde, 80; George Brenneke, 80; Oregon Agricultural College (barred rock), 80; Alex Stewart, 79; S. L. Gibson, 79; Mrs. H. C. Kliensmith, 79; George Gray, 78; D. B. Walls, 78; La Rita Trapnest Farm, 78; Santa Barbara Poultry Ranch, 78; Fuller & MacCallister, 78; S. L. Gibson, 77; Ed Crewson, 77; Warren Wood, 76; W. H. Marshall, 76; La Rita Trapnest Farm, 76; Bellows Bros., 75; Hampton & Louches, 75.

POISE IS A MATTER OF SELF CONTROL

Poise is power. The man who is not master of himself under all conditions cannot feel the assurance, the power, which is the right of every human being to experience. He is never sure of himself, and the man who is never sure of himself is never wholly at ease. He is not even well bred, for good breeding implies self control under all circumstances.

There is, perhaps, no other thing which is so conducive to one's physical and mental comfort, efficiency, happiness and success as a calm mind. When the mind is unbalanced by anger, excitement, worry, fear or nervousness, the entire body is thrown out of harmony. All the functions are deranged; the man or woman is not normal, and is, therefore, whatever the situation, at a complete disadvantage, wholly unable to contend with it.—Orison Swett Marden.

ON THE JOB

You belong to the Society for Prevention of Cruelty to Animals, don't you?" asked the caller.

"Yes. I'm one of the officers," replied the man at home.

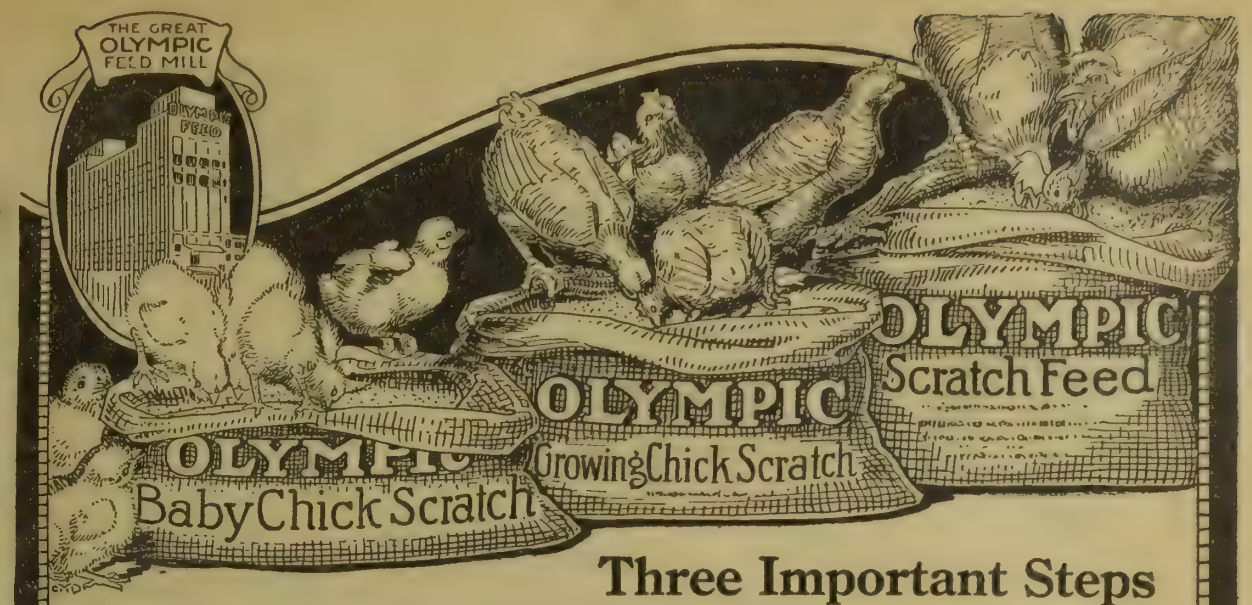
"Well, here's a song I dedicated to your society. I'd like to sing it to you."

"All right. Wait until I put the cat out of the room."—Yonkers Statesman.

THE REVERSE

Kate—She asked that question just out of idle curiosity, don't you think?

Laura—No; busy curiosity. Her curiosity is never idle.—Stray Stories.



Three Important Steps

THE most critical time in the lives of young chicks is the first few weeks. Their undeveloped systems are yet unable to throw off injurious irritants, so great care must be taken in their feed and feeding.

But OLYMPIC Baby Chick Scratch is milled expressly to assist OLYMPIC Chick Mash with *Dried Buttermilk* during the first few weeks' critical feeding. Selected from strength-giving, energy-building grains and entirely free from dust, these tiny, easily handled particles appeal to the chick's appetite, as do the bright colors attract their eyes. After three weeks, when the Mash is changed to OLYMPIC Growing Mash with *Dried Buttermilk*, the chicks graduate to OLYMPIC Growing Chick Scratch, made from the same wholesome ingredients but ground just coarse enough to tempt growing chicks until about eight weeks old. Then they are able to handle the larger grains of OLYMPIC Scratch Feed, changing the mash to OLYMPIC Egg Mash, with *Dried Buttermilk*.

Blended for results by practical poultry feeders and chemists, the OLYMPIC Scratch Feeds contain: Wheat, Cracked Corn, Kafir Corn, Milo Maize, Hulled Barley, Hulled Oats, Buckwheat and Sunflower Seed. This great variety of elements not only makes the feed exceedingly palatable but assures maximum assimilation.

Every hen in your flock is a "PROMISE TO PAY"

This hen means well enough. Chances are, she has the best intentions in the world. She is quite willing to own up to the fact that she is your debtor. You feed her. You take good care of her. [Perhaps you've raised her from chickhood.] And you devote your time to her physical welfare. In return for all that, you have every right in the poultry world to expect enough eggs to pay a healthy interest on your investment. But then—

Remember that even the best-intentioned hen won't "pay in full" unless the feed you give her contains the elements necessary for egg-building. Nature provides each laying hen with just so many eggs in embryo. And if you leave it to Mrs. Biddy she is apt to take six or seven years to produce her full quota of eggs. And, incidentally, she is apt to leave *you* high and dry in the process.

Your job, then, is to make Mrs. Hen "make good" her promise to deliver this amount of eggs in *two or three years.* And the biggest single help you can have is SURELAY. For it is SURELAY'S mission to make your hens pay by making them lay.

When we say SURELAY is the "cheapest" feed you can use, we mean just this: SURELAY will net you *more* in return for your feed-money than anything you can buy. You must realize that it takes more energy for a hen to convert poor feed into money than it does to convert good feed into money. What's more—there isn't such a heap o' difference between the cost of good feed and poor feed. But look at the profit-difference when you're through!

That's why thousands and thousands of wise poultrymen have come to bank on SURELAY. It contains the ingredients your hens need to make them profit-producers. These ingredients are balanced and blended more skillfully and economically than can possibly be done by hand. And SURELAY is always uniform—always the same—thanks to our daily laboratory tests!

If you want to see how SURELAY will help you "cash in" on all the "promissory notes" in your flock—simply clip the coupon below. In return you'll get a copy of our booklet, "Makes Hens Happy." It shows how to spur your flock into action and make 'em happy in the bargain. Send for it today—it's free!

SURELAY

"A Sperry Product"

"There's a Sperry Feed for every stock and poultry need, and remember every sack is guaranteed."

TRACKLAYER "SIXTY" PULLING WIDE HARROW

Lowering the Cost of Production

That is the farmer's problem — lower cost for starting, maturing and harvesting his crops.

One way of doing this is to cover more ground in faster time with less help. That means *power* farming, particularly the use of *reliable* tractors of sufficient power and endurance for the work.

Reliability is important. For your investment in power machinery this year should carry you over several years to come with the very minimum of up-keep costs.

You know the reputation of Best Tracklayer Tractors for reliability, endurance, power and low operating costs. This reputation has been earned by many years of conspicuous and successful performance on the farms of the Pacific Coast. Best Tractors are an institution in the West.

Right now you need a Best Tracklayer Tractor. You know you can depend on the Best at all times under the severest conditions of prolonged operations.

You know that your Best will be on the job not only this season, but next season and for many seasons, performing faithfully and earning a profit for you. This season the farmer will buy the machinery he needs for economical production, and will buy the makes he knows he can depend upon to give reliable, satisfactory service for many years to come.

Labor Housing Problem Being Solved

By C. B. Messenger

THE days of the blanket man have not gone entirely; there are still many sections where housing conditions are not ideal; but the last half dozen years have noted wonderful advancement in housing and giving to laborers in California fields and orchards better living conditions. This is securing a more permanent and home loving type of labor and is vastly more satisfactory to both employer and employe. It is costing the farmer some money to fit up these homes, but a period of a very few years will probably show net gain.

Within the past two or three years a number of these little colonies have been established which may be considered as models. Some of them have been referred to, and illustrated articles regarding them given in our columns. One, known as the San Dimas Mexican Settlement, has been built by members of the San Dimas Lemon Association, of which T. R. Hobbs is manager, and the San Dimas Orange Growers Association, E. M. Wheeler, manager, and J. E. McFadden, assistant manager.

For many years these associations have felt the need of more dependable supply of day labor, for labor employed year in and year out. Heretofore, a lull in the packing season, with only occasional day's work, resulted in the Mexican family packing up and moving away to the nearest job.

Something over a year ago the two associations decided to unite and make a home settlement for this class of labor. A tract of land comprising about seven and a half acres was cut up into lots of about 40 by 80, each lot neatly fenced. On each of these lots a concrete four room cottage was built, or at least on 36 of them, each cottage representing an investment of $1,300. In addition there have been built two good sized bunk houses, each containing 14 rooms.

Exactly the same plan is followed in every one of the 36 houses; a tiny concrete front porch, living room, kitchen, two bedrooms, shower bath. Each kitchen has running water with good combined sink and laundry tray. The sewage for the settlement is handled in a series of cesspools. The floors are of concrete, ceilings of one of the ordinary wall boards. Finish is in natural yellow pine. There are screen doors and windows and casement sash.

Under certain regulations a small number of poultry may be kept. Other animals are not permitted about the house, but in the barranca or "wash" crossing one corner of the settlement long low sheds have been built and there milk goats, cows and horses may be stabled.

The rental for these houses has been fixed at $11 per month. Such rental would not satisfy the landlord who is making a business of renting cottages, but owing to the permanency of these buildings it has been determined to fix this amount of rental with the idea that in a period of two years the cottages will pay themselves out through a loan made with one of California's popular building and loan associations.

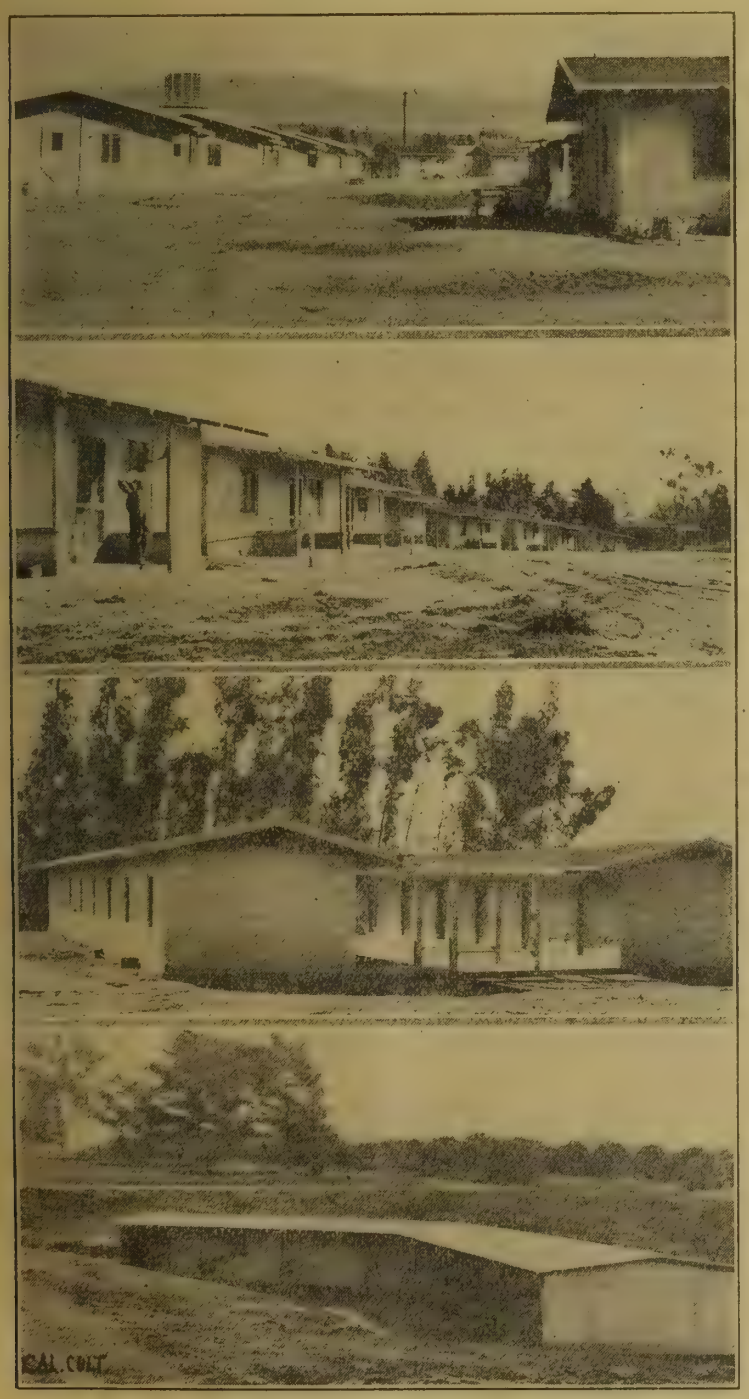
As fast as the cottages were finished, they were filled; the demand still continues, and many times the present capacity would not meet the demand. However, the labor supply for the two packing houses and the orchards connected with them has been stabilized.

The state housing commission has ruled that four grownups and four children is the limit for houses of this size, and this presents a difficulty to the management, requiring constant watching, for many have been the cases where the herding instinct has been allowed full sway and the cottages overfilled. Connected with the settlement is a clinic in charge of graduate nurse, and under direction of the public schools near by Americanization training is given. Pomona is supporting an interdenominational mission which affords religious training. There are no set rules as to sanitation or cleanliness, but the nurse has been in charge of this feature of the work and satisfactory results have been secured.

About $50,000 is invested in the entire settlement and owing to the economical and permanent construction $11 per month will not only pay out but allow reasonable interest rate. Greatest economy is secured in the management because of entire matter being handled by bookkeepers of the two associations, whose offices are just across the highway from the settlement.

Another and larger settlement, which was once described in the Cultivator, is that on the Limoneira Ranch at Santa Paula. Others are located at College Heights, Claremont, and at Uplands, where both orange and lemon growers combined in building 40 cottages. About the same number have been built by the packing houses at La Verne. These, however, are of hollow tile. Another is at Glendora where a very attractive "bungalow court" has been constructed. Others are located at Covina for the Orange Growers Association. These cottages are better built and are intended for American help.

Illustrations on this page give very correct idea of these little cottages.



The San Dimas Citrus Workers' Plan of Housing

Upper picture shows diagonal lay of the street giving sunshine on four sides of every cottage in the row some time during the day. Second from the top, view along another street, showing attractive nature of the cottages. Third from the top, single men's sleeping quarters. Court is open at both ends. These quarters are supplied with shower baths and reading or lounging room. Bottom picture shows animal quarters where the goats, cows, horses and pigs are maintained.

March in the Vegetable Garden

Northern California

By A. R. Gould

THERE should be great activity from now on in this department and our planting list will continue to be extensive, as we have to sow many of our principal crops. Steady rains have been very helpful and have put the ground in excellent shape, and where the plots were prepared early as we advised a month or two ago, by deep trenching, they will be ready now for sowing. The careful gardener will keep records and the garden notebook should contain a complete record of dates of sowing, location of plots and results. Crop rotation is very important, and by keeping a record of your operations you may easily carry out a system of rotation. It is never advisable, for instance, to grow potatoes year after year on the same ground, or tomatoes, as the spores of fungus diseases which attack them remain hidden in the ground for some time and will be a source of trouble.

Beans

There is yet a chance that we may have more frosts, and it will not be prudent to sow the more tender varieties of beans. However, the Canadian Wonder, a very fine flavored string bean, is hardy, and a sowing may be made in rows placed two feet apart. The Broad beans sown last fall will soon be ready to pick.

Peas

The earlier varieties will by now be several inches above the ground and will need constant cultivation between the rows and a close watch kept for aphis. They may be destroyed by spraying with "Black Leaf 40." Successive sowings of peas may still be made of the following varieties: Little Marvel, a dwarf type with very well filled pods; Stratagem and Yorkshire Hero, both good main crop varieties and semi-dwarf.

Potatoes

Secure your seed tubers at once

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

If the grower ever grew good fruit he should grow better this year, and if he never grew fruit which was simply an A-1, perfectly formed, highly flavored, first-class article before in his life, he wants to study the game and learn cultivation, irrigation, pruning, thinning, spraying, and every other step that makes for a perfect product.

* * *

We talked just the other day with a cannery manager. It was J. A. Campbell, manager of the California Growers Association string of canneries. Mr. Campbell is just back from the East. He has been asking the big buyers and jobbers; "What are we going to do about it?" And they have said: "Grow and pack the highest grade product possible. There is always demand for top-notch stuff."

* * *

Mr. Campbell then remarked: "Had you ever thought that in addition to being more attractive and more salable, the higher quality large fruit is likewise vastly cheaper in the handling. Take, for instance, a box of apricots, large, fine canning fruit. It costs only half as much to cut it as it does the box of tiny undersized stuff. The filler of the can is likewise handicapped, that is, if the small stuff is worth packing at all. Again, the greater weight of fruit goes into the can of small fruit. This may be considered at first thought favorable to the buyer, but, as a matter of fact, so far as his preferences are concerned, he will take a lesser quantity of fine large size fruit.

* * *

It costs money to spray and to thin fruit; it pays.

* * *

There is a hot time under the old dome at Sacramento. Since the days of corporation domination there has never been such a lobby under control of what is apparently one directing head. Likewise, there is another lobby, or, we prefer to call it, committee, representing the farmers, and that organization is doing some wonderfully effective work.

* * *

That agricultural legislative committee has stuck close to its program of watching legislation inimical to agriculture and securing legislation beneficial to agriculture.

* * *

This committee has stuck strictly to its text, and it is, "Agriculture." For a long time it considered the "King bill" as not exactly within the province of an agricultural committee. That bill has to do with taxation, with raising the revenues required for the state from the corporations. It has become an established principle in this state that county and municipal needs shall be met by an ad valorem tax but that state revenues shall be derived by taxation on the gross income of the corporation.

* * *

The heated discussion which has been stirred up by this taxation matter has reached such a stage that it appeared that appropriations which are necessary to continue agricultural prosperity were being jeopardized. A special meeting of the agricultural committee was called and there were long and detailed hearings with the state budget board, the board of control, committees of state bankers associations, and other representatives of corporations, and the fact was established to the satisfaction of the committee that in cutting $24,000,000 from the proposed budget which had been done by the budget committee, it was reduced to its minimum.

* * *

With the minimum of the budget established, it seemed to be simply a question of whether the plan for taxation should be changed entirely and the state tax placed back on an ad valorem basis or left, where it has been for the past few years, on the corporations. On this point there could be but one decision by the committee, and after long and detailed hearings "The agricultural legislative committee endorsed the King Revenue and Taxation Bill by a vote of nine to two with three members not voting but explaining their position as favoring economy and opposing ad valorem tax."

* * *

We will all join with the three not voting in favoring economy, including without question, the nine, but the welfare of the state is at stake and we realize that the state has never advanced as rapidly as during the past two years, and if this is to be continued, it must be granted that the tax budget must increase.

* * *

The discussions of radical changes in the college of agriculture will continue another two years. The public hearing called for February 25 in the assembly chamber resulted in a mass meeting. The chamber was packed and the crowd remained until after midnight to hear the discussion which revolved around the regents' plan to give the first two years of agricultural training at Davis or elsewhere and the final two years at Berkeley. Opponents of this plan asked that the college be moved entirely from Berkeley to Davis, but all parties agreed that an excellent plan would be to appoint a strong committee, at least one-half of which should be farmers, to make a careful investigation of this whole matter during the next two years and report to the next legislature.

* * *

There are several bills which have been presented to the legislature, dealing with irrigation and drainage. These matters are somewhat technical, so the agricultural legislative committee has asked Professor W. W. Weir of the University of California to analyze the measures pertaining to drainage, and Professor Frank Adams of the United States department of agriculture and University of California to analyze the bills pertaining to irrigation.

* * *

A great many bills have come before former legislatures, and some have been passed by them, which were in very poor form and some contained serious errors. An example of this is the pure seed bill passed by the last legislature, but which was necessarily vetoed because of the technical error of having two appropriations within one bill. To eliminate these errors so that bills are in proper form and to be sure that no dangerous clauses are contained in any agricultural bills the agricultural legislative committee has obtained the services of an attorney of wide experience in agricultural legislation.

* * *

In the pruning down of the budget so as to bring within reach of the income it is possible that appropriations for livestock shows, one to be held in San Francisco and one in Los Angeles, may be jeopardized. Senator Rush has introduced a bill appropriating $200,000 for shows in these two great centers.

* * *

The work of Secretary Wilson of the agricultural legislation committee has been most efficient and of great value to the committee and to agricultural interests. This committee has acted practically as a clearing house for a mass of material intended to prove beneficial to the producing interests. Through efficient work these various bills have been harmonized and errors or wrong construction eliminated. Some of California's keenest minds have been drawn to this committee work and they have served well, paid their own expenses and received a salary consisting of oodles of good will and entire absence of mazuma. The advantage comes in not having income tax complications.

ORANGE SHOW

San Bernardino flung the bunting to the breezes, paraded, brass banded, orated and placed King Orange on his throne with much feasting and toasting. Honored guests were Princes Lemon, Citron, Pomelo, Lime and a host of the Citrus By-Products family.

It was a good show and thousands enjoyed it.

The citrus experiment station made a most striking exhibit of varieties. There were some scores of them, many unknown to most of us and of little probable value, but continued in the station grounds for educational or possibly breeding value. It was surprising to note the large variety of limes, some of which have proven hardy and have promise as possible future profit makers in California orchards. This state is not a commercial producer of the lime and while this fruit has no great field in the market it yet has sufficient demand that if a type adapted to this state can be developed it would justify limited culture.

The orchard appliance and equipment feature of the show was fine, though by no means equal to the gambling doll baby stuff.

IT IS CONSTITUTIONAL

Dispatches from Washington announce:

"The farm loan act, designed to assist agricultural development by providing readily accessible credits to farmers through federal land banks, was declared valid today by the supreme court," and Commissioner Lobdell remarks:

"This removes every shadow of question as to the legality of the banks or their bonds," and one C. W. Smith, a stockholder in the Kansas City Title and Trust Company, may now trot home and tell the various land mortgage concerns, who were deeply concerned lest the farmer should have a fair show, how it happened.

The best of it is that it was practically a unanimous decision on the part of the supreme court. It upholds the authority of the government and confirms its power to designate its fiscal agencies, a power which has been conceded congress since the days of Chief Justice Marshall.

The farm loan board succeeded in advancing to 75,000 farmers nearly $200,000,000 before the big mortgage concerns awoke to the fact that real justice was being given to food producers. The 75,000 who had been granted the loans were entirely safe in their position, but the 179,000 with applications filed with the loan banks for nearly $650,000,000 more of loans were prevented from securing their money. Now let the farm loan association get action as quickly as possible and the loan banks provide the money.

FARM BUREAU RECOMMENDS

Farmers are better organized than ever and are presenting things more forcefully to the powers that be at Washington than ever before. The farm bureau, especially, is proving sufficiently powerful to gain at least some attention. It has succeeded in bringing before legislators and, in fact, the entire country, farming questions, and it is to be hoped that some definite action will result. Besides the emergency tariff and some other live questions which it has taken a hand in, it recommends the following five points for consideration by the next congress:

Regulatory power over farmers' cooperative marketing associations should be in the hands of the United States department of agriculture rather than the federal trade commission.

The farmers' cooperative marketing movement must not be hindered by the provisions of the Sherman law, enacted to control trusts and not with any intent to curb cooperation for the benefit of the public at large.

The federal reserve bank act should be amended so as to provide preferential rates for loans for productive purposes over loans for speculative purposes.

The warehousing act should be extended so as to serve the needs of both individuals and cooperative associations, and there should be based upon it a rural credits plan which will enable the farmer, individually or collectively, to market his crops in an orderly fashion.

The federal land bank system should be extended to provide farmers with personal credit, for such purposes as buying improved seed, livestock, machinery and equipment, on the same general plan as real estate loans are now provided.

Second Annual Stockmen's Week

By R. P. Royce

THE second annual Stockmen's Week, held at the university farm, Davis, February 22-25, was attended by several hundred livestock breeders and operators, including men interested in beef cattle, dairy cattle and swine. If the attendance failed to come up to the expectations of those responsible for the event, it was demonstrated beyond doubt that there is a real need for such an annual get-together meeting and that the idea back of the plan is susceptible of great development, and that eventually, with proper support, this annual week can be made an institution of influence. Such a week of meetings and activities can be made to bring the different breeders into closer contact with one another; will acquaint the livestock interests of this state with the work of the college and at the same time acquaint the workers in the college with the problems of the livestock industry to the end that all branches of the industry will progress to the greatest degree.

The dominant note of the entire series of meetings and sales was the necessity for the use of a better class of sires in the upbuilding of our herds and flocks and for the adoption of proven methods of progressive management. Speaker after speaker who knew from experience stressed the point that with changing conditions one of the main problems of California agriculture is the allotment of a more important role to livestock in our scheme of operation. Notwithstanding a feeling of uncertainty on the part of livestock producers as to just what the future holds in store for them, a feeling that was manifested in the various sales of cattle and hogs held during the week, many men found sufficient inspiration in the meetings to become owners of a better class of livestock. That fact alone justifies the effort made by the university authorities in arranging the details of the event.

The week was started Tuesday morning with that veteran livestock supporter, Senator Benjamin F. Rush, president of the California Shorthorn Breeders Association, presiding. Dean H. E. Van Norman of the university farm school welcomed the stockmen and extended the freedom of the institution to them with the injunction that they feel entirely at home. Professor R. F. Miller, acting head of the animal husbandry division, discussed

(Continued on Page 324.)

Quality Fruit and Quality Pack Will Save the Day

By C. B. Messenger

THESE are the days when everybody is talking about the return to normalcy. We aren't perfectly sure just what normalcy means, for it is not yet in the dictionary, but it has a sound which is something like what we want to express as to the period through which we are now passing in the disposal of our fruit crops, especially that portion which has been put in tin cans. These are not by any means in a class by themselves, for practically every production of the state is suffering during the return to normal — or what may seem like abnormal—conditions. But there are some features of the canned fruit trade which are different. In common with practically all other products, however, this condition obtains, that only about half of last year's output has left canneries and warehouses of the state. In normal years it was considered that on the first of January at least one-third of the last season's crop should be in the hands of the consumer or retailer, another third in the hands of jobber and large wholesaler and the remainder in the hands of producer or canner.

Now what are we going to do about it?

Nothing can be simpler than the answer. "Sell the fruit and pack some more." All that this situation needs, we believe, is a bit of patience, some cool heads, and more cooperation, and maybe a few incidentals such as reducing prices over those named last fall, lowering freight rates, making greater use of water transportation, and doing a lot of advertising.

Note that we have given to the human factor the three fundamentals in the present campaign. As a rule, patience and cool headedness we have. The cooperation is getting along pretty well, thank you, but it must be borne in mind that cooperation is being tested as never before. Cooperation that results in entirely satisfactory closing of the season will live and take care of itself, but cooperation that has to endure the ebb as well as the flood tide must depend on these two preceding factors and use a whole lot of common sense and be willing to take the lean years with the fat years.

The fruit growers have organized two large cooperative canning associations in California. The California Growers Association, Inc., has headquarters at Los Angeles and a membership of over 600, maintaining canneries at Ontario, Riverside, Hemet, Fallbrook and Elsinore. The officers of this associaiton are: Benton Ballou, president; F. A. Anderson, vice-president; J. O. Mills, secretary-treasurer; J. A. Campbell, general manager. The California Cooperative Canneries, the other large association, has headquarters and its largest packing plant at San Jose. Its officers are S. E. Johnson, president; Albert Haentze, secretary-treasurer; Vernon Campbell, vice-president and general manager.

Both of these associations have been canning fruit for members for several years. The year 1919 was an exceptionally successful one. Last season's fruit crop was fine in quality and large in quantity. It was canned and, as noted above, much of it is still in California. The condition this has created has caused R. G. Spencer, organization manager of the California Cooperative Canneries, to write:

"We should consider it one of our first duties to give the growers exact information regarding market conditions as they affect their business. With this thought in mind we are opening a campaign throughout the Northern and Central California fruit districts. We want the growers of canning fruits to know just what condition the industry is in, what the future promises, and what can be done to solve the problems which are presented.

"Measured by present conditions the future is anything but bright. Cannery warehouses throughout the state are filled with the unsold fruit packed during the past season. This fruit was purchased from the growers at the highest prices ever paid. It was packed in syrup made from sugar costing as high as 25 cents per pound, with the average price for the season in the neighborhood of 20 cents. The wages paid under the regulations of the state welfare commission were advanced over previous years. In fact, practically every item of cost was at the highest point, making the total cost of the finished product far beyond any figures heretofore known.

"The prices of canned fruits and vegetables weakened and added to the lack of confidence on the part of buyers. Finally buying practically stopped and for the past several months the energies of the cannery sales forces have been largely devoted to the problem of accomplishing delivery of orders already secured. Buyers cancelled orders or rejected shipments without compunction.

"As a result of these chaotic conditions estimates of the surplus unsold stocks vary from 5,000,000 to 5,500,000 cases, equal to a whole season's output before the war."

These words were written some time ago and conditions today are not so serious. The best of it is that the growers are aware of the situation and are prepared to meet it with determination and still stick together in disposing of the fruit on hand and packing next season's fruit. We have asked J. A. Campbell of the California Growers Association to give suggestions as to the outlook and procedure during the next few months. Mr. Campbell writes:

"The growers of canning fruit are facing a very serious situation in connection with the marketing of their fruit during the coming season and should be brought to realize the true condition of the foreign and domestic markets so that they can meet the situation intelligently.

"The canned goods market today is in a very demoralized condition and sales are being made at such heavy discounts that it means enormous losses for the canners, a number of whom will not be able to continue in business. There will be a great many thousands of cases of canned fruit, which were packed during the season of 1920, that will be carried over and must be marketed along with the coming pack.

"The foreign countries which were the largest consumers of California fruits, both canned and dried, have been beggared by the war, and their people are buying only the bare necessities of life. The change in these conditions will naturally be slow, and until the foreign trade can again be revived we must depend almost wholly upon our domestic market.

"With the prospect of a heavy crop it is very likely that there will be hundreds of tons of canning fruit that will go on the ground. It is very evident that there will be practically no market for a poor grade of fruit, and the grower should exert every effort to produce as high a quality as possible to insure a market for his crop.

"Two or three months ago very few retail stores could be found where there was any effort made to reduce the price of California canned fruits to meet the idea of the consuming public; consequently our canned goods were not moving in any quantity. This condition is undergoing a change, and the reductions in price made by the canners make it possible for the retailers to feature California fruits at a very low price, which is having the effect of increasing consumption.

"Our foreign trade is practically nil, and we need not delude ourselves that conditions will improve very rapidly. We are facing the necessity of depending almost wholly upon the domestic market for the consumption of our canning fruits. Prices must necessarily be low to encourage the use of canned fruits as a staple article of food instead of a luxury.

"I do not wish to appear pessimistic, but we need not blind ourselves to the true conditions. There are over 2,000,000 unemployed men in the United States at the present time, and wages are being reduced throughout the whole country. The buying power of the rural population is most seriously affected by the stagnation of the cotton and grain markets and the great decline in price of all farm products. To meet this condition it is evident that prices must be in harmony with the ideas of a conservative buying public, and every effort must be made to stimulate the use of our fruits as a staple article of diet. Canners and packers will sell very close to their costs of production and costs will be cut as low as possible. Not only will the prices offered to the grower for his fruit be low, but the careful packer will only receive such fruit as can be handled economically and at a profit. The grower cannot expect to market a poor grade of fruit when there is an ample supply of high grade fruit to supply the needs of the packers. For example, peaches of good quality running 100 to the box cost less to grade, cut, and pack than peaches running 200 to the box. The large peaches of good quality will make 45 cases of canned peaches per ton, while the fruit of small size, costing almost twice as much to handle, will make about 30 cases of an inferior quality of fruit per ton.

"With market conditions such as we are facing there is no question as to which quality of fruit will find a market and which will be left in the orchards. The wise grower is the one who does not neglect his orchard but properly prunes and sprays his trees and thins his fruit in order to produce quality. This is a year for quality, not quantity."

Agricultural News Notes of the Pacific Coast

Northern California

Olive Day was well celebrated all over the state.

The Biggs rice mill will be moved to Willows, Glenn County.

There is considerable agitation in Mono County to protect home water resources.

The Owens Valley Pear Growers Association is signing up a number of new members.

Asparagus shippers of the Sacramento delta are ready to open their campaign in earnest.

Several ranchers near Santa Rosa have signed contracts to plant pickling cucumbers for $75 a ton.

It is expected that favorable weather conditions will permit of threshing operations in the Colusa County rice elds.

A free market for farmers of Yuba County will be established at Marysville under direction of the farm bureau.

Slight frost in the northern end of the Sacramento Valley is reported to have done no damage to the almond bloom.

A bill has been proposed in the state legislature by Bishop of San Diego providing a department of state police.

Organization of the cherry growers of the Sacramento Valley is being urged in order to better market conditions.

The Paradise farm center of the Butte County farm bureau held its annual meeting February 12 with attendance of 150.

Sacramento County almond growers are trying to find some profitable use for almond hulls other than use of the ashes as fertilizer.

E. A. Kirk, formerly secretary of the Glenn County farm bureau, has been appointed secretary of the Orland chamber of commerce.

Officials of the Prune and Apricot Growers Association deny that 1920 prunes are being sold in the East on a basis of 50 per cent lower than opening prices.

From now on the Sonoma County Fair will be known as the North of the Bay Counties Fair. J. Francis O'Connor has been elected president of the fair association.

A county wide squirrel drive is planned for all districts of Contra Costa County under the direction of the farm bureau, the campaign to be followed up consistently throughout the year.

The west side of the Goose Lake Valley in Modoc County reports marketing more than $200,000 worth of wheat during the past few weeks at a price to the grower ranging from $2.35 to $2.40 per bushel.

Farmers of Glenn County have appointed a committee to consider plans for erecting a grain elevator. A. H. Quatman is chairman of the committee. Other members are E. R. Tweede, J. L. Fulton, O. L. Raper, D. A. Shelloe and Ernest Eibe.

The Pacific Rice Growers Association is urging growers not to abandon the industry in spite of the discouraging conditions of last year. Growers are advised to plant earlier in the season in order to get the rice harvested before bad weather.

Central California

350,000 head of sheep will be clipped in Kern County this year.

Retail prices of milk at Modesto have been lowered to 14 cents, beginning March 1.

Sheep shearers of the San Joaquin Valley have agreed to work for 15 cents a head and board.

Sheep clipping has started in Kern County; approximately 350,000 head of sheep are ready for shearing.

The annual meeting of the Stanislaus County Fig Growers Association was held at the Ceres high school February 12.

The Merced County farm bureau has heartily endorsed the new contracts sent out by the California Associated Raisin Company.

Helm, Fresno County, hopes to be the location of one of the grain elevators of the California Farm Bureau Elevator Company.

Growers committees have been organized throughout the raisin growing section to secure quicker signing up of the raisin contract.

State Forester G. M. Homans was in Tulare recently and discussed with those interested tree planting along the Tulare-Visalia highway.

The Merced County farm bureau has appointed a committee of fruit growers to discuss with growers in other counties a uniform wage scale.

A committee of five from the Kern County farm bureau has been making a tour of Los Angeles County, studying irrigation methods as followed there.

The marketing department of the Tulare County farm bureau has arranged to receive and ship veal calves on a basis similar to that used in handling hogs.

President Barrows of the state university is reported expressing himself to Fresno people as in favor of establishing a branch of the state university in that section.

Farm management schools have been held under the auspices of the Kings County farm bureau. The use of farm account books is a main feature recommended.

Farm center meetings will be held in Kern County at: Weed Patch, March 7; McFarland, 11; Delano, 14; Old River, 15; Wasco, 16; Rio Bravo, 17; Edison-Fairfax, 18.

The farm bureau announces that four and possibly five grain elevators will be secured for Stanislaus County. Patterson, Westly, Hickman and Montpelier are the four assured locations with chance of another at Hughson.

Members of the Civic Commercial Club of Bakersfield are planning to meet the acute housing need by subscribing to a non-profit organization which will build and sell houses to homeseekers who are unable to finance themselves.

The San Joaquin Valley won first prize in both the feature display and commercial pack at the San Bernardino National Orange Show this season for the first time in 11 years. The first prize for feature display was awarded to the Fresno County chamber of commerce. The first prize for commercial display of oranges was awarded to the American Fruit Growers of Lindsay.

Souhern California

The Orange Show at San Bernardino had a big attendance.

Imperial Valley shipped out nearly 3,000 carloads of lettuce last year.

C. M. Brown of Redlands is making test of shipping oranges in bushel baskets.

The Whittier Walnut Growers Association now has in its membership 2174 acres.

The Associated Chambers of Commerce of Imperial County met at Niland, February 25.

Burbank, Los Angeles County, has authorized a bond issue of $120,000 for installation of a sanitary sewer system.

Reports of 1920 shipments show the southern orange producing district of Orange County practically all in Valencias.

The Garden Grove Citrus Association of Orange County has closed its packing house until the Valencia season opens.

Effort is being made by the Orange County farm bureau to secure establishment of a fertilizer testing laboratory at Santa Ana.

Members of the San Joaquin League of Municipalities last week visited Los Angeles to discuss development of water power sites.

At the recent annual meeting of the Whittier Walnut Growers Association A. H. Dunlap was chosen president and C. I. Thill secretary.

There is a movement in Victor Valley of San Bernardino County to organize a fruit association and erect cannery and by-products plant.

Horticultural Commissioner Waite of Imperial County condemned a shipment of oranges carrying scale. The shipment came from the coast.

At the annual meeting of the Whittier Walnut Growers Association the secretary reported handling of a crop valued at $456,033.42 the past season.

At the annual meeting of the Orange County farm bureau directors W. M. Belding was reelected president and Dr. J. R. Schofield, secretary-treasurer.

A rodent control campaign is planned for Imperial Valley. Superintendent of Rodent Control Jacobson has spent several weeks going over the ground.

C. G. Tanner of Morro has been appointed deputy county horticultural commissioner of San Luis Obispo and will have entire charge of rodent control work in that county.

The chamber of commerce of Anaheim is raising funds to finance the California Valencia Orange Show to be held at Anaheim, May 17-21. It is proposed to make this an annual event.

The Van Nuys district of the San Fernando Valley has a walnut tree of the Chase variety which produced 212 pounds of select nuts at the age of nine years. It is in an orchard owned by Manager Kibbie of the Lankershim walnut house.

A quarantine to protect the citrus industry against citrus black fly has been announced by the U. S. horticultural board. It becomes effective April 1, and regulates entrance of fruits and vegetables from the West Indies and many oriental points.

The Coast and General

Canadian producers are fighting against the high freight rates.

A new cow testing association has been organized in Columbia County, Oregon.

Southern Arizona and New Mexico ranges are still suffering from drouth conditions.

The annual wool clip of the Yakima Valley of Washington is about 2,000,000 pounds.

Grangers of Hood River County, Oregon, are subscribing capital for a cooperative store.

There is much interest throughout the Southwest in proposal to harness the power of the Colorado River.

The Kittitas County Pure Seed Growers Association of Washington is sowing certified seed of wheat and oats.

Breeders of Duroc-Jerseys held a Duroc Day with sale and show at the Oregon state fair grounds at Salem on February 3.

The report of the Washington state reclamation board shows over 3,000,000 acres of land now susceptible to reclamation.

Western New York estimates 2500 carloads of cabbage yet unsold. Some sales have been made at $8 and $9 per ton for best Danish.

Beekeepers of Hoquiam County, Washington, have organized with W. L. Cox of Elma as president and G. A. Gillette as secretary.

Prune growers of Clarke County, Washington, organized a pool, 410 growers signing up. It has sold 200,000 pounds of prunes.

Airplane patrols of the national forests are credited with saving $35,000,000 worth of standing timber from forest fires during last season.

The Northwest potato market shows the lowest level in years. Army awards were made last week at 69 cents per hundred. Onions went at one cent per pound.

The first annual farmers institute of Benton, Franklin and Walla Walla Counties was held at Pasco, Washington, recently with an attendance of over 200.

The weather bureau at Flagstaff reports snow on the mountains very much below normal, only the higher northern slopes being covered to a shallow depth.

The Puyallup and Sumner Fruit Growers Association, Washington, declared a dividend for 1920 of over $150,000. The association expects to build a jam plant.

The first straight carload of garlic from Washington state was recently shipped to New Orleans. Most of the garlic was raised in the Tualatin and Beaverton districts.

The Eugene Fruit Growers Association at Eugene, Oregon, made sales of fruit and vegetables during 1920 amounting to $700,000. Besides this it has in storage $500,000 worth of canned goods.

The Washington Beekeepers Association has asked the legislature to pass a law requiring that before trees are sprayed with arsenic sprays, all nectar bearing blossoms under the trees, such as alfalfa blossoms, shall be cut.

Spray Pears

PEAR growers and shippers recently met at the state department of agriculture to discuss plans for the year in connection with the spray schedules. Committees were appointed for the following purposes: To urge appropriation by congress of $10,000 for investigation by the department; to arrange for the extension of such cooperation as was necessary by growers and shippers to A. J. Ackerman, the government specialist now studying the question, and to draw up a circular of information to be sent to all pear growers, giving the best advice at present obtainable on the question of avoiding spray residue, pending results from the work of the department. The latter committee met again on Friday, February 18, to prepare the circular. This recommendation is given by Harry S. Smith. The department further gives details of work:

Equipment

Use only power spray machines supplying at least 200 pounds or preferably 250 pounds pressure. The machines must furnish ample agitation to keep all the ingredients thoroughly mixed at all times and prevent the spray becoming more concentrated in the bottom of the tank. Use good nozzles, preferably large Eddy chamber type with small openings in the disks. Disks wear out rapidly and should be changed often. If spray guns are used keep them so regulated as to give out only a fine mist spray. Use ten pounds paste or five pounds powdered arsenate of lead to 200 gallons.

Time of Application

Calyx Sprays.—If possible begin first spray as soon as half of the petals have fallen. Go over the orchard a second time not later than seven to ten days after the beginning of the first application.

First Cover Sprays.—First cover spray should begin four weeks from the time of beginning the first calyx spray. Go over the orchard a second time not later than seven to ten days after the beginning of the cover spray.

Second Cover Sprays.—Go over the orchard again with a light spray finishing not later than four weeks before picking time.

Picking

If at time of picking a conspicuous amount of spray residue shows up, be careful that it is removed before packing.

General Considerations

It is believed that spray residue difficulties can be eliminated by using care in spraying. Use standard brands of lead arsenate, see that you have good pressure, the proper type of nozzle and a good agitator in your tank. Pay particular attention to the calyx spray. The possibility of eliminating the later sprays, which have caused the trouble, will depend on how thoroughly the worm is controlled by the early sprays.

In all the cover sprays the greatest possible care should be exercised to give a complete, uniform coating on all the fruit and foliage, but not to allow any excessive dripping or splotching. This necessitates the use of nozzles with very small openings in the disks and very high pressure in the pumps to produce a fog like spray. The trees must of course be sprayed from all sides, and on large old pear trees better results will be obtained if the inside of the tree is sprayed first. Therefore the operators should be instructed to get the nozzle or spray gun inside the spread of the branches before it is opened. Then spray as well as possible all of the fruit and foliage on the inner part of the trees, after which the outer and remaining portion may be sprayed more advantageously by going completely around each tree. The desirable thing to do is to spray each pear and each leaf from every possible angle.

The use of so-called spreaders is at best of doubtful value. It is believed that forcing the spray under high pressure through nozzles with small openings in the disks will give better results. Thorough, careful spraying as outlined herein should control codling moth and not leave objectionable residue on fruit when shipped.

Orange Growers Restive

Central California orange growers are not satisfied with the results secured from shipping of the holiday fruits going to market largely in late November and through the month of December.

Tulare County fruits are early in coloring and also early in season and contain large content of sugar, hence the greater bulk of California holiday fruit goes from that section. This year Florida did some especially heavy shipping, and as Central California fruit is controlled by the exchange to the extent of only about 60 per cent, it left the distribution in the various markets in a most chaotic condition, Florida shipping as it pleased, some fruit through its exchange, some through independents, California shipping almost half and half through the exchange and independent shippers. This resulted, as may be imagined, in glutted markets in some sections and markets without sufficient fruit in others. Central California growers are now demanding more intelligent handling of the situation, and there is 100 per cent cooperation in the making of this demand, but beyond that only confusion, for outsiders are saying "Let us form one great association similar to the raisin growers," while exchange members are saying "Why destroy the old, which has been efficient so far as the growers would allow it to be, for the sake of erecting a new organization?"

Meetings have been held and a committee of independents and exchange members has been appointed. The committee consists of the following men: W. A. Bohland, King G. Gillette, A. N. Ashley, J. W. Irwin, McKee Mhoon, Basil Prior, Chas. Burr, C. K. Towt, Walter Cairns and C. O. Cowles.

Reporting the situation and the feeling of the growers, the Lindsay Gazette says:

"The growers' complaint in this regard as it was brought out at the meeting Tuesday is that all other agencies, including the packer, the railroad, the broker, the picker, and all his other creditors, come out with 100 per cent for their part of the transaction. After all deductions are made, he must meekly take what is handed to him, whether the figures be red or black.

"He does take it meekly. He had protested in a way, as was evidenced by the interest before the meeting Tuesday, but after the meeting was over it can be said that at least a large proportion present have long been reconciled to the powers that be. Whether anything will result from the gathering on Tuesday depends, of course, upon the committee named by Mr. Eckert. State aid and the cooperation of big men should be solicited."

The crux of the whole situation is expressed in this, that expenses and commissions are guaranteed to the railroads, commission men and others, and there is nobody left to guarantee the producer. He has to carry his own and others' risks.

PRUNE PACKING PLANT IN NEW YORK

The California Prune and Apricot Growers, Inc., will establish a prune packing plant in New York City where part of the fruit for the New York market and for export business out of New York will be packed, according to announcement by H. G. Coykendall, general manager of the association, who has just returned from a month's trip in the East.

By the operation of this New York packing plant unprocessed prunes will

The Aldrich:

A piano that we can recommend, at a price certain to be attractive

SHERMAN, Clay & Co. take pleasure in calling to your attention the Aldrich piano—either upright or grand.

The Aldrich is modestly priced, but it is not a "cheap" piano.

It is made for us, in factories selected by us, and its performance in the homes of its purchasers is to us a matter of pride and interest.

be shipped through the Panama Canal and when packed in New York they will be fresher and cleaner than any fruit which can now be put in that market. It is impossible to ship processed prunes through the Panama Canal because the added moisture which the fruit absorbs during the trip causes the fruit to mold.

The association's plant in New York will also save the grower members of the California Prune and Apricot Growers, Inc., thousands of dollars a year now lost through freight charges.

Through the efforts of the association a 60 cent steamer rate on unprocessed prunes has been obtained and an exceptionally low rate on box shook which will save the growers about $1.35 on every hundred pounds of fruit.

All the machinery for this packing plant will be bought in California and shipped East and a complete packing crew will be made up here and will go East to operate the plant.

Commenting on market conditions in the East, Coykendall said that outside growers who have turned their stocks over to independent packers to ship East on a consignment basis have not only lost thousands of dollars themselves but are responsible for the weak condition of the market today.

Stocks of these cheap prunes are becoming very scarce in the large Eastern jobbing centers, according to Coykendall, who said he expected them all to be pretty well cleaned up within the next three weeks or a month. Just as soon as this clean up occurs Coykendall feels sure that prunes will bring better prices than have been quoted since the first of the year.

California Citrus Institute

THE third California citrus institute at San Bernardino last Friday and Saturday failed to bring out the liberal attendance it should have had. The discussions were intensely practical. The institute is supposed to be made up of citrus people with desire to investigate the scientific end of citrus growing problems and, in fact, that is the real aim of the organization, yet it showed most excellent judgment in the practical turn given to the discussions of this meeting.

President Barrett proved an excellent presiding officer. Things moved from the start and the program was strictly adhered to. Fumigation questions filled the forenoon of the first day, traction power discussion the afternoon, while Saturday was given up to practical orchard methods and to cooperative marketing methods.

Prof. H. J. Quayle considered himself only a thin piece of meat in the fumigation sandwich. Preceding him was an address by J. A. Prizer, a careful discussion with many figures to clarify, or possibly confuse, on "Fumigation versus Spraying." Mr. Prizer is superintendent of the Merryman Fruit Company at Exeter and wished it understood that his discussion had to do only with central San Joaquin Valley's problem in control of thrips and soft gray scale. Following Prof. Quayle came Harry S. Smith of the state insectary, treating upon biological control of insect pests, so Prof. Quayle rather took the position that his discussion on fumigation would prove of little interest after Mr. Prizer's clean-up with sprays and Mr. Smith's clean-up with natural beneficial insect enemies. However, Mr. Prizer did not stick exclusively to sprays, neither did Harry Smith succeed in cleaning up all orchards with his millions of Aphycus lounsburyi, hence there was room for the meat of the sandwich.

As noted in his discussion, Mr. Prizer did not stick exclusively to sprays, in fact, made most fair comparison of these two methods of control. As fumigation is not practical with thrips, which is a perplexing pest in Central California, some spraying is found essential, hence effort has been made to combine a spray which will prove effective with both scale and the thrips. Mr. Prizer, however, reached the conclusion that to accomplish the same results as can be accomplished with thoroughgoing fumigation the expense is fully as great.

We hope to quote more fully from all of these papers, especially to give the new schedule intended to fit the conditions created by the gas tight tent, which Prof. Quayle and Hugh Knight have worked out in conjunction with Goodyear and other fabric people.

The afternoon session was given up entirely to traction power use in citrus groves. W. H. Fleet, manager of Rancho Sespe, read from the most carefully prepared manuscript we have yet seen touching upon tractor use in orchards. It was elucidated by liberal series of charts and tables made possible by the careful bookkeeping methods at the great Rancho Sespe. Mr. Fleet showed wherein certain types of work required in a well kept orchard could be done economically only by tractor employment; again, in smaller areas, or where light surface work was desired, horses were preferred. The conclusion was: Employ the tractor where its work results in better soil conditions. This can only be determined by careful observation or, better, by careful bookkeeping in connection with the observation of soil requirements. Mr. Fleet was followed by C. A. Griffith, manager of the Azusa Citrus Fruit Company, and his conclusions were practically the same.

J. A. Dennis touched upon tractor use from a different standpoint, in the small citrus orchard through cooperative ownership and operation. Mr. Dennis is manager of one such association, which has a number of orchard tractors which have proven entirely satisfactory to the San Dimas orchardists.

Saturday was by-products, transportation and marketing day, with liberal attention in the afternoon to topworking of citrus trees.

Every one of the addresses given at this institute is worthy of place in the columns of the Cultivator, but already this week the paper is overfilled. Another week we hope to give at least portions of these addresses.

Get This Tractor's Record

You will want to know all about this Stockton tractor. What it is and the work it will do make it interesting.

Get the record. Ask us for facts. If your neighbor down the road, and your neighbor up the road find that it does **their** work better and cheaper, you will want to know what it will do for you.

Two types are built, a tracklayer and a round wheel type. One is best for your soil. Find out which. Both are low and narrow, to get close to trees and vines. Both turn short and pull hard, and you can operate between close set rows of trees.

Both have Herschell-Spillman motors, Berling magnetos, Hyatt roller bearings. But get **all** this information and the name of the dealer near you who will be glad to demonstrate. Write and ask for folder D.

AVOCADO DIRECTORS MEET

At the February meeting of the board of directors of the California Avocado Association great regret was expressed that the scarcity of ripe fruits at the present time and the high prices are tempting many growers to market their fruits while still quite immature. There are more avocado trees bearing this year than ever before and there has been some apprehension in the minds of growers as to whether there would be a market for all of the fruit. But there is a much greater demand for the fruits this year. The fruit dealers are beginning to awaken to the fact that the avocado is going to be a factor worth their consideration and are making plans for the distribution of such surplus as is not absorbed by our local markets. An active educational campaign in California is being planned by the avocado association, which will require the cooperation of the growers and will be one of the points to be discussed at the annual meeting.

An excellent program is being planned for the annual meeting, including an experience meeting and an unusually large exhibit of fruits. The increasing membership promises a large and interesting gathering.—R. Agnes McNally, Secretary.

CELERY

Shipments of celery from the El Monte district of Los Angeles County have been going forward quite rapidly for the past two weeks and at the present rate the available stock will soon be cleaned up. Owing to the long dry spell in the fall, followed by sudden heavy rainfall, much of the El Monte celery this year shows deep growth cracks at the base of the stalks, presumably caused by a sudden growth of the heart after the outer branches had matured.

Blight has been well controlled where patches were sprayed more than four times, but those which were not properly cared for evidence considerable injury from blight on the leaves. On the whole, however, the quality of the El Monte celery being shipped this year is equal to that of past seasons.

Growers are securing little more than the cost of production this season, which seems to indicate that under prevailing freight rates the acreage will be somewhat reduced next year.

Some of the finest celery being shipped from the Los Angeles district at the present time is coming from the district around Watts where a considerable acreage has been planted this year on new soil. Celery moving from the new district around San Diego is of exceptionally fancy quality and compares favorably with the best stock grown in the northern part of the state. Growers in the vicinity of San Diego use fertilizer extensively and blanch the stalks by wrapping

with paper instead of banking with dirt. Under these methods it is hard to see where on the present market and under existing freight rates the growers will be able to make any money.

CAULIFLOWER

The cauliflower season in Southern California is rapidly closing and supplies of any kind are very scarce. The best quality is now being shipped from the Fruitland district and the market continues strong under an active demand from Eastern cities. Broccoli is moving from the Colma section in the northern part of the state, but not in heavy enough volume to affect the demand for Southern California stock. Cauliflower is being grown this season for shipment a little later, in at least two entirely new districts, and it is not at all unlikely that the future will see cauliflower successfully shipped from various parts of the state. This is one crop moving from California which during the winter months meets with no competition from other producing areas in the United States and has always been a fairly profitable crop for the growers.

LETTUCE

Practically no straight cars of lettuce are now being shipped from the Los Angeles district for the reason that supplies are scarce and the quality ordinary as compared with that moving from the Imperial Valley. Repeated frosts and hot, dry winds have seriously affected the quality of Los Angeles lettuce in the past few weeks.

Shipments from the Imperial Valley are still going forward under a fairly steady market and it now appears that practically the entire acreage planted in the valley will be shipped in spite of the existing high freight rates. This does not indicate a profitable deal for the growers, however and, as a matter of fact, they are receiving in many cases less than the actual cost of production. It is either a case of taking a chance on making a little profit or plowing the lettuce under, and usually the growers prefer to take a chance. Shippers in some cases had large acreages under contract and large supplies of shook on hand, so that they, too, are forced to make the best of conditions as they are. There is practically no doubt but that the acreage planted to lettuce next season, if the high freight rates continue, will be considerably less than this year.

The quality of the Imperial Valley lettuce now rolling forward is in general very good, but the stock all season has been running small in size and, as in the case of oranges this year, the small sizes are being discounted.

Peas in the valley are reported to have been seriously damaged by recent frosts, and where the vines were frosted the production will be greatly reduced. Tomatoes in the Imperial Valley will probably begin to move in carlots the latter part of April. Anthentic reports have been received to the effect that recent heavy winds did not do as much damage to the cantaloupes as had been feared at first, and with favorable weather conditions from now on the indications point to earlier shipments of melons from the valley than last year.

Citrus Freight Rates

By R. W. Hodgson

TESTIFYING to the intense interest which citrus growers have in freight rates as affecting their present unsatisfactory returns, nearly 100 citrus growers of the Alhambra-San Gabriel district attended last week a special mass meeting called under the auspices of the Alhambra farm bureau center.

The principal speaker of the evening was Assistant General Manager Dezell of the California Fruit Growers Exchange, who is in charge of the activities of the organization with respect to alleviation of the freight rate situation. He traced briefly the history of the freight rate situation, narrating how in 1897 the $1.25 per hundred pound rate was officially established, in 1902, modified, giving a winter relief rate for lemons of $1. In 1906, after hearings before the interstate commerce commission, the railroads decreased the orange rate from $1.25 to $1.15, leaving the rate for lemons at $1. In 1909, after the passage of the Payne-Aldrich tariff by which lemons received 1½ cent protection, a movement toward increase of freight rates on lemons was made by the railroads, but on taking the matter up again with the interstate commerce commission the $1 lemon rate and $1.15 orange rate were established, although protested by the railroads on account of the generally known fact that the actual weight of the boxes was in excess of the estimated weight on which the rate was made.

With the taking over of the railroads by the government there were put into effect a number of charges which during recent months have become so pyramided as to constitute one of the most serious factors in the citrus fruit situation. The first of these, coming early in 1918, was the allowance to the railroads of the increase in estimated weights which added somewhat to the freight rates borne by the orange package but which was gotten around in the case of the lemons by a small decrease in the size of the box.

Other items allowed were extra demurrage charges, diversion charges and track storage. In June, 1918 there was allowed a flat increase in rate of 25 per cent, to which was added a war tax of three per cent. But the climax came in August, 1920, with a straight increase of 33 1/3 per cent in freight rates. The result is that today it costs $1.55 to ship a box of oranges to the Eastern market as against 82.8 cents prior to the war, an increase of 87 per cent; with lemons it costs $1.44 as against 84 cents prior to the war, an increase of 72 per cent. A protest was made months ago to the interstate commerce commission, but without satisfaction. The matter was then taken up directly with the railroads, but without relief. The exchange is at the present time preparing to take the matter up again with the interstate commerce commission.

Interesting developments of recent months directly affecting the freight rate situation brought out by Mr. Dezell include the successful shipment by water via the Panama Canal of several thousand boxes of lemons and oranges and the recent reduction in water transportation rates from $1.05 to 70 cents per hundred. It was stated that it is now possible to ship a box of lemons to Philadelphia or other Eastern seaports at a saving of practically 60 cents per box over the freight rates by rail.

It was estimated by Mr. Dezell that half the lemon crop might satisfactorily be shipped under ventilation by water. Experimental shipments of oranges are planned and several thousand boxes of citrus fruits are being shipped direct to Holland.

Mr. Dezell was followed by Farm Adviser Robert W. Hodgson of Los Angeles County, who spoke on the advantages of nation wide organization in agriculture, drawing attention particularly to the outstanding achievements of the American Farm Bureau Federation during the past year and announcing a national gathering of fruit growers at Chicago, April 5, called by the American Farm Bureau Federation for action on such matters as freight rates and tariff.

EAT ORANGES—PLENTY OF THEM

Oranges are now at their very best, sweet, juicy, wholesome. No spring tonic can equal the benefits derived by having oranges in some form on the table every day—or three times a day.

Real Californians don't need a reminder to eat oranges, but just as a hint, let us refer to some simple ways of using.

Orange Juice

Straight orange juice pressed out and served in glasses at breakfast, lunch or dinner will take the place of coffee, even to the confirmed coffee drinker. Some like it better with a little water and sugar added, or a dash of grapefruit or lemon juice.

Delicious Salad

Peel, quarter, remove skin from quarters, arrange on salad plate, add little lemon juice, salt, black or cayenne pepper. Nothing better with heavy meal.

Sliced for Dessert

Peel, removing all white inner rind, slice thinly, sprinkle liberally with granulated or powdered sugar, let stand at least an hour before serving. A good old fashioned way is to add liberal sprinkling of freshly grated cocoanut.

Slice in same way with bananas or pineapple, or both.

Ten new allotments in the Durham Land Colony of Butte County are now available for settlement.

How to save nitrogen in barn manure

One of the best and most expensive fertilizers known is barn manure because it contains so much nitrogen. When exposed to air, fully two-thirds of this valuable nitrogen escapes in volatile ammonia fumes.

Cover manure in the barn and on the pile with AGRI Gypsum and this valuable nitrogen will be retained. Every dollar's worth of AGRI Gypsum saves $3.00 in nitrogen by transforming the volatile ammonia into non-volatile ammonia.

AGRI Gypsum will not only cut your fertilizer bill but give BETTER fertilization. It is specially selected, specially prepared and specially ground Gypsum rock. A poor agricultural gypsum is not of much benefit; AGRI is a remarkable fertilizer.

Plant Winter Rhubarb and BERRIES for PROFIT

We can supply plants—all sorts for large fields. Plant also peaches, plums, prunes, pears, figs, apples, apricots, asparagus, artichokes, etc., for your own table and pleasure. We have a good assortment of fruits of all sorts. Write for price list. J. B. WAGNER, Rhubarb and Berry Specialist, Pasadena, Cal.

STARTING TREES FROM SEED

Perhaps the cheapest and frequently the best way to start a forest plantation is to collect seed from hardwood trees and grow seedlings,, say forest specialists of the United States Department of Agriculture in Farmers' Bulletin 1123, "Growing and Planting Hardwood Seedlings on the Farm," just published by the department. The collected seed will be fresh and the seedlings grown from it should be thoroughly acclimated as far as climate is concerned.

Middle aged trees growing in the open where they have been permitted to develop broad, spreading crowns ordinarily produce seed in greater abundance than trees growing in a dense forest. The fruit of some hardwood trees requires special treatment to separate the seed from the fleshy covering, pod or hull before they are planted.

The best time to sow seed, either in the nursery or in the permanent planting site, is soon after it is ripe, but when this is not possible the seed must be stored until spring. If this is done the seed must not be allowed to dry out excessively, because this impairs its power to germinate. Seed should be stored in a cold place.

The bulletin deals larely with Eastern conditions, but two illustrations of California eucalyptus and some of the text have to do with California conditions.

WALNUTS UP

The California Walnut Growers' Association announces "Coast stocks of all grades, both 1919 and 1920 Association walnuts entirely exhausted with exception of three cars 1920 No. 2s not to be offered till next fall." Consigned stocks are practically all exhausted. New York and other large market centers are already marking up No. 1s and Fancy Budded a cent a pound. This will mean that the grower profits little directly, but presumably the general situation is such that the trade will have a good taste in its mouth for new walnuts next fall. The association is advising the jobbers to stock up while it is possible to secure first class goods.

All foreign walnuts in Eastern markets are also well cleaned up and the price on foreign walnuts has been steadily advancing within the past few weeks. It is a certainty that there will not be a pound of California walnuts carried over into fall and the new crop is sure to come into the cleanest market ever known.

CORRESPONDENCE COURSE IN APRICOTS

"Apricot Culture" is the title of a new correspondence course now ready for distribution by the University of California. The subject matter has been written with the cooperation of specialists well posted in the different phases of apricot growing, and it is expected that the course will fill a long felt want for concise, interesting and reliable information on this important California industry. Circular No. 113 describes the plan for enrolling and will be sent free upon request to the Director of the Agricultural Experiment Station, College of Agriculture, Berkeley, California.

NURSERYMEN HAVE HOUSE ORGAN

The executive committee of the California Association of Nurserymen is now issuing a quarterly bulletin to members, detailing such information and suggestions as in their judgment possess an interest and an importance to the welfare of the commercial plant business, and dealing with transactions of the association through its governing officials. The bulletin is also designed as a free forum in which members are invited to discuss in a brief and businesslike way any problems and practices affecting the nursery business. The committee consists of Fred H. Howard, chairman, J. E. Bergtholdt, J. D. Meriwether, E. B. Washburn, Max J. Crow.

CHECKS ILLICIT GRAPEFRUIT TRAFFIC

On January 25 the California department of agriculture received a wire from Commissioner Kellogg reporting that a certain cigar company at Tampa, Florida, was soliciting orders for Florida grapefruit to be delivered in California. A wire was then dispatched to Wilmon Newell, commissioner of horticulture of Florida, asking that assistance be given in having the said company cancel its California orders. On January 31 the entire transaction had been completed and the cigar company had cancelled its orders and promised to discontinue soliciting orders in California. This furnishes an excellent example of the quick action that can be obtained in matters of this nature when a good working understanding exists between the states so concerned.—D. B. Mackie.

HOME CURING OF OLIVES

It is certainly to be regretted that olive growers are to be prevented from marketing home cured olives. This simply means the uprooting of thousands of olive trees in scattered sections where there is insufficient quantity for delivery to packers at great distances. The Cultivator still hopes that this ruling of the state board of health may be modified. It is possible that for the present it is the only safe ruling to be made. However, we wrote the board of health and asked as to whether there had ever been known a case of poisoning from eating home cured olives which are not subjected to high temperatures and have the following answer:

"It has been demonstrated by the scientists that the bacillus botulinus will grow in bulk olives. It is not our desire to work a hardship on the small producer of home cured olives, but in the interests of public health we feel that it is unsafe to exempt home cured olives. Our advice to the small grower is that he should procure an inexpensive sterilizer and sterilize his pack before placing the same upon the market. In fact, the large producer who has sterilizers has in many cases expressed a willingness to assist the small producer in the sterilization of his product. Consequently, we do not feel that any exceptions can be made in reference to the home packed olives."

The Cultivator has asserted that there is no known case of such poisoning. We regret that we do not have more definite answer in this particular from the board of health. That the botulinus "will" grow in bulk olives may be demonstrable in the laboratory. We do not think this is justification for the drastic ruling which has been made.

HIGHER PRODUCING TREES

The importance of using carefully selected buds for propagation is now so generaly recognized that we cease to have arguments as to using only selected buds and consider only ways and means. This work is made possible and effective through the extended investigations conducted by A. D. Shamel of the federal department of agriculture. Mr. Shamel has devoted his time to the behavior of citrus trees, or of buds from trees of known performance, and has made such graphic demonstrations with such buds as compared with others selected at random that the most casual observer has recognized the value of those particular trees.

The recognition of the difference in performance of selected and non-selected buds has caused not only citrus growers but nurserymen and others to unite in organizations whose energies are given to securing buds from trees of known performance. This work will mean much to the future of the California fruit growing industry, more, we believe, than its warmest friends are insisting upon today. Citrus organizations have gathered a fund of information as to trees of known performance and have secured a list of experts who are capable of topworking old and established but undesirable trees. This work is often so indifferently done that some orchardists have decided that rather than topwork they will uproot and plant new stock from dependable nurserymen.

But in any case the buds being selected today are making for a richer California.

The Cloverdale center of the Sonoma County farm bureau has elected C. E. Humbert, director; Carl Haehl, secretary-treasurer.

Why Big Jim is the world's champion corn

—it is the largest, heaviest yielding, richest yellow dent corn ever introduced.

—ears will average two to the stalk and from 10 to 15 inches in length. Kernels extra large, cobs proportionately small.

—stalks attain enormous height, bearing an abundance of broad leaves, which makes Big Jim the ideal corn for ensilage.

—grows in ANY soil.

—buy from your dealer.

TERRACE YOUR BARRANCA

By Helen Chaffee Temple

BARRANCAS of some shape or size stretch themselves lazily across an otherwise trim, pleasing landscape. And we all have 'em. True it is that barrances are necessities, but it is also true that most of them are twice as large as need be, many of them cutting deeper and deeper into the land as the years go by.

J. A. Harrison purchased a bit of the most desirable land in Ventura County. A barranca was included in his purchase. It was just an ordinary ugly barranca with all the failings of other barrancas to the eyes of the world at large. To the eyes of Mr. and Mrs. Harrison the barranca was not ugly. They visioned a future day when it should be transformed into a thing of beauty and usefulness. And today, after several years of loving labor, their vision is a vision no longer; it is an actuality. Rome was not built in a day. Nothing worth while is built in a short time. If we want something worth while we must work for it slowly and carefully. The beauty and usefulness of the Harrison barranca was made possible by spare time work.

Mr. Harrison is one of the foremost apiarists of Southern California. When he was not at work with his bees he worked with the barranca, cutting steps into the sides. It was painstaking work, but both sides were finally built into terraces. Then lemon trees were set out. They thrived unusually well, being so protected from all wind and frost. Then a carpet of ice plant (mesembryanthemum crystallinum) was planted to trail over the terraces and edges. The actual bed of the barranca is kept clear of debris. The water does not cut in during the "running season" owing to the roots of the growing things. And now the fruits of their labors are realized in the unusually large crops of lemons taken from the young trees. The trees are irrigated with pipes and hose connected from the domestic water supply. This barranca is situated on the Ventura boulevard, where hundreds of eyes turn toward it as one of the most beautiful spots in the county.

A rancher in the Mound district has a large barranca at the back of his ranch. It is a large overgrown child of nature. Needless to say it acted as most overgrown children. It took more and more of this rancher's land until he made a few rough terraces and planted gum trees on them. The barranca now furnishes an adequate fuel supply each year for the use of two families.

Another barranca, that spread over a large portion of a small poultry ranch, was terraced and used for chicken runs. The chickens, being fed with self feeders and watered with perpetual fountains, saved the usual amount of "stepping up and down." The bottom terrace or step, however, was planted to kale and chard, being irrigated from the supply of water running from the fountains. Several gum trees grow near the bottom of the barranca, their roots standing guard against erosion.

HOLLYHOCK RUST

One deterrent to growing hollyhocks is the unsightly foliage and loss of foliage caused by the rust, Puccinia malvaceaerum. This is very bad in California for it is easily carried over from season to season by the native mallow, Malva parviflora. Therefore keep mallows from the garden, though it is a common volunteer cover crop in orchards. If disease appears, pick off affected leaves, which will be the lower ones, and spray lower two-thirds of plant with Bordeaux mixture. Hollyhocks need a deeper and better drained soil than any other herbaceous garden plant, for they have a long, heavy tap root which should have free entrance as deeply as it wishes to go. If this soil bed is provided there is little danger of serious trouble from the rust, for vigorous plants are but lightly affected or not at all.

Onion growers of the Coachella Valley are somewhat concerned as to prospects of shortage in supply of onion crates because of shutting down of Eastern factories.

TEAGUE TREES

Ask the man who has planted them and he will tell you that Teague Trees are unequaled in growth and productiveness.

They are the best that can be produced.

If you intend planting CITRUS TREES it will pay you to come and see our stock and let us figure on your requirements while we still have a good assortment to select from, as the supply of good trees is limited.

Avocados, Feijoas and other Tropical fruit trees in all of the recommended varieties.

Send for our new descriptive price list and tell us what you intend to plant.

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Federal Farm Loan

How and where could we get in touch with an agent of government farm loans? Have ranch of 340 acres. level land and good buildings, etc.—Subscriber, Hemet.

Unfortunately, at this moment it is impossible to arrange for a federal farm loan. We have word from the Berkeley bank that very few loans are being made and they are loans practically all to those who have made applications some time ago. The first step in securing a farm loan through the federal land bank is to joint a local farm loan association. The appraisers of that association then take up the matter of the valuation of the land on which the loan is desired. An expert of the bank verifies this appraisement and the application then comes before the land bank. Unfortunately, all of these steps have taken much time and where one wishes the money at once it might be impossible to wait. The entire matter is in an embarrassing position because the big land mortgage institutions are finding the federal land bank is making serious inroads on their business and have carried the matter into the courts as to the constitutionality of the law making these banks possible.

(Since this was put in type the supreme court has ruled that the act is constitutional and it is probable that the banks will soon extend loans.)

Rebudding Lemon Trees

A subscriber wishes to know as to the effect on oranges if budded onto lemon trees. The question was referred to R. M. Teague, who answers:

It is feasible to bud lemons over into oranges, but in certain locations and under certain conditions it does not prove a profitable investment. Some experts advise against it, Shamel, Milliken and others. A lemon trunk seems more susceptible to gum disease than the orange. However, if we had a lemon orchard in a sheltered location and in a fairly healthy condition we would not hesitate to rebud it to oranges. A lemon tree is one of the easiest of the citrus varieties to take buds in the process of rebudding. Mr. Shamel and Mr. Milliken made a trip north some time ago throughout the San Joaquin Valley on the particular subject of rebudding lemons to oranges, and our impression is that they advised the bulk of the planters it would be wiser to interset than to rebud, as in this way they would secure up-to-date pedigreed trees on selected stocks.

What Is Phylloxera

In the California Cultivator of February 5, 1921, the pest known as phylloxera is treated on page 163 by Fred K. Howard. I have read the article with great interest, but I am sorry to state that Mr. Howard failed completely to give any introduction to the insect. He makes no mention of what it is like or how we are to know it. He says nothing about its specific injury to the vines nor how we may know how our grapes are infested with it.—Subscriber, Hayward.

If the Hayward inquirer will read the article on phylloxera again I am sure he will find a very good description of the insect under the subtitle, "What Is Phylloxera?" It was not the intention of the writer to enter a technical discussion of this insect, but a few further facts along the lines suggested would prove of value to one who wishes to know whether or not the insect is present in his vineyard. The attacks of the insect on the roots cause small swellings which permit very rapid rotting, so the small feeders and many of the larger roots are destroyed as rapidly as they can grow. The result of this root injury is a short, stubby growth, much as one would expect on alkali land or in some cases on extremely sandy soil; however, the appearance of phylloxera injury is typical and once seen is usually well remembered. If there is a spot in the vineyard where the vines are not doing well, or if there are several spots where the vines in the center are dead or nearly so, the conditions gradually improving toward the outer edge of the spot it would be a good plan to get a shovel and investigate the roots. Select a vine which, while showing some injury, is not too near dead, and dig out some of the roots. If they show considerable signs of decay you may have some strong suspicions that phylloxera is present. As the insect is so small that it can scarcely be seen with the naked eye, it is obvious that it is difficult to find unless one knows just what to look for. In this case it would be wise to ask your local horticultural commissioner to help you in the search. In the East there is a winged form but so far as is known at the present time this form is not present in California, so practically the only method of spread long distances in this state is on rooted vines, and the prospective planter should use every precaution to prevent the introduction of the insect to his ranch by this means.—F. K. H.

Queen Victoria Grapes

Where can I secure cuttings or rooted vines of Queen Victoria grape?—Subscriber, Orange.

This we are unable to answer for our inquirer. Perhaps some other subscriber has knowledge where they may had.

Pruning Thompsons

In pruning one year old Thompson vines I left only two buds on weak vines and a longer cane up to 18 inches according to growth, but since then have read in a book to either cut to desired length of heading vine or else two buds. Shall I prune them again?—Subscriber, Denair.

If the stronger vines to which you refer made only enough growth to leave 18 inches I would by all means suggest that you cut them back to two buds this year. If you will give the vines the proper attention this summer and train a good strong growing shoot up to the stake, you should have very little trouble in making your permanent trunk next winter.—F. K. H.

Chemical Weed Killers

We wish to know if there is any sure way to kill out Bermuda grass without injurying the land. We are advised to use a preparation called "Imperial." Do you know anything regarding this remedy, as to its ability to wipe out Bermuda grass?—Subscriber, Turlock.

We have heretofore answered similar question in effect that the best of all weed killers is a sharp steel plow or cultivator. In the case of Bermuda, morning glory or others which grow from cuttings, it is best to keep the tools on the infested section only until the pest is thoroughly eradicated or the infestation is liable to be spread to other portions of the same field. Regarding the use of chemical killers there is still a question mark in the minds of most of the growers. Prof. Gray, formerly of the state university, now with the U. S. department of agriculture, has made extended investi-

gation and has found where greatest care is exercised and application of certain poisonous chemicals is made in summer time when plants are in fullest growth that good returns may be had though at an expense which is justified only where crops making big returns are to be planted. There are now several of these weed killers offered by the trade, but where one has serious infestation it may be well to make some thoroughgoing experiments, keeping definite records as to behavior of the plant after application of poison and as to all of the conditions which obtained at time of making the application. As to the weed killer referred to, we are not informed.

Maintaining Nuisance

A man who owns orchard land above mine is harboring Bermuda grass. He had men dig some of it out but they threw it onto my land, where it has started quite a large patch. The waste water from his irrigations is also allowed to run on my land, carrying the seeds with it. Is there any way in which I can collect damages or compel him to take care of his waste water?—Subscriber, Cabazon.

This question is not referred to the legal department for it is more a matter of fact. Of course an irrigator who permits his water to escape onto the property of another is liable to damages whether it comes from direct injury of water or from carrying of noxious weeds on the place. This is a case where the county horticultural commissioner should be notified and asked to help bring the weed pest under control, and then of course one should take the matter up with the party who is continuing to harbor the pest and perhaps through cooperation both places may be cleaned up better than by legal means.

Testing for Lime

What are some reliable ways to test ground for lime content?—Subscriber, Anaheim.

"Go to the agricultural chemist" is about the only answer to this question. However, as to whether the soil is in alkaline or acid condition may be quickly tested by litmus paper. If the blue litmus paper turns red after it has been saturated with some of the soil moisture then your soil is acid and the application of lime will prove beneficial. But determination as to actual lime content can only be had through analysis.

Fertilizer for Walnuts

Is it profitable to fertilize walnut orchards ranging from eight to twelve years of age, in addition to winter cover crops? What kind is used?—Subscriber, Anaheim.

The best fertilizer for walnuts is whatever you can get. That is, if stable manure is available, by all means get it. If not, use bone meal or superphosphate and perhaps dried blood or other nitrogen former and at time of cover crop secure as heavy a crop as possible. If the soil is not altogether too deficient in nitrogen perhaps the blood, which is very expensive, need not be applied. Presumably your soil is rich enough in potash. In case it is then we would apply complete commercial fertilizer.

Currant Fruits at Redlands

A Redlands subscriber in the Cultivator for January 8 asks if there is a variety of black currant that will fruit in the vicinity of Redlands. Four years ago I bought the Crandall's Black currant from the Fancher Creek Nurseries in Fresno, and with but indifferent care I get a good crop of berries every season. These currants are not juicy, like the red currant, but make a nice jelly.—Mrs. Wm. J. G. Lambert, Visalia.

Intersetting Vines with Citrus

Is it advisable to interset Red Emperor grapes in citrus orchards?—Subscriber, Richgrove.

If the trees are to be planted at least 24 feet apart it is possible that one might secure a few crops of grapes before it would be necessary to remove in order to give the trees their best opportunity to grow. It must be borne in mind, however, that it will be but very few years before the tree roots will fill this space and these additional plants will take some of the nourishment. They would also prevent during the latter part of the summer thorough tilth and might prevent best soil conditions. For an intercrop we would prefer alfalfa, berries, vegetables or beans, especially the alfalfa and the beans might be plowed under and prove of real value to the soil. In any case intercropping requires a larger amount of water than is needed for the orchard alone.

Figs Not Bearing

I have some white figs that do not mature well. While the fruit seems ripe and some fall, the seeds are not large enough nor are they ripe. Some have tough woody spots on them. The soil is black loam, has enough moisture and a black fig tree grows near that has good fruit. Will spraying them help destroy the germ that causes this?—Subscriber, Upper Lake.

This may be a Smyrna fig which requires pollination. If so, the only way to help is to secure a supply of capri figs.

The tour of farm advisers and farm bureau delegates will this year visit the San Joaquin Valley, May 23-28. Last year the trip was made through the Sacramento Valley to Redding.

Supply your car from this 128-page book

and save 1/3 on auto supplies

The motorist who makes a habit of consulting the Western Auto catalogs when in need of anything for his car not only saves himself many dollars but gets better service from his car. MARCH IN THE VEGETABLE GARDEN

(Continued from Page 307.)

and prepare your "sets" by cutting the tubers, leaving about two good "eyes" to a section. These may be placed in a flat or shallow box and allowed to sprout and by the end of the month planted in well prepared soil. If farmyard manure is obtainable this should be placed in the bottom of the trench before planting. A commercial fertilizer such as bone meal or dried blood will also be helpful and bring increased yields. Do not waste time or money by planting on poor soil. Regarding the varieties, plant Early White Rose and American Wonder and insist on having the best seed. Five to six sacks of tubers will be required to plant an acre. It is a safe plan to dip the tubers in a solution of formalin before planting as preventive against fungoid disease. Plant the tubers in rows four to six inches deep and 12 inches apart in the row, which should be two feet apart.

Cabbage

Sturdy plants of Early Jersey Wakefield and Early Winnigstadt should be planted out now in rich soil in rows 18 inches apart, the rows being two feet apart.

Lettuce

Sow very thinly May King and Los Angeles for a successional supply, covering the seeds one-quarter of an inch deep in rows 20 inches apart. This crop delights in rich soil. Varieties sown last month should be thinned out and transplanted to six inches apart.

Radish

Sowings of Early Scarlet Turnip and Half Long may be made now on rich soil and the seed sown broadcast or in rows.

Carrots

This crop requires well prepared soil and will repay any extra trouble by larger yields. Make sowings of the small French Forcing, Oxheart and Long Orange. Sow seed very thinly in drills half an inch deep and 18 inches apart. Later they must be thinned.

Tomatoes

Prepare hotbed by building a wooden frame or using large boxes two feet deep, and on this place fine soil to sow seeds of the following varieties. Chalk's Early Jewel, San Jose Canner and Ponderosa. Cover the frame with cheesecloth or glass. If the latter is used it must be well shaded and the frame ventilated. By this method you may secure early plants. Prepare the plots in the meantime for this crop.

Onions

The main crop varieties will now be ready to thin out and transplant to six inches apart. Keep them well cultivated between the rows. Onion sets may still be planted. Plant six inches apart, two inches deep.

Turnips

Sow on well prepared soil very thinly Early Snowball, Purple Top, Flat Dutch or White Egg, all good table varieties. Sow the seed in rows 20 to 24 inches apart. They require plenty of moisture during their growing season.

Beets and Swiss Chard

Sow Crosby's Egyptian and Early Blood Turnip varieties in rows 20 inches apart. Swiss chard is grown for the leaves or tops used as spinach. Sow Large White in rows 24 inches apart.

Southern California

By D. F. Reichard

PEACH and apricot trees are coming into bloom, so according to Uncle Sam's garden advisers it is time to begin planting our spring garden. They are right. If the plot you are to put into garden is not ready, have it worked up at the earliest possible moment. The rains so far this winter have come in fine shape. It is now up to the garden makers to take advantage of this moisture by working their ground and keeping it pulverized.

Although it may be a little cool during the early part of March for the "warm temperature" vegetables, there are a goodly variety of things to be planted at once in the open ground. Sow the seed of lettuce, either Iceberg or Los Angeles Market; spinach, kale, endive; Crosby's Egyptian beets; Oxheart carrot; radishes, parsley, turnips, onions and Laxtonian peas. It is getting late to plant peas in Southern California, but by using the Laxtonians you can get a crop before it gets too warm for them. Set out plants of cabbage, cauliflower, kale, Swiss chard; the later part of the month set out tomato plants, peppers, eggplant and sweet potatoes.

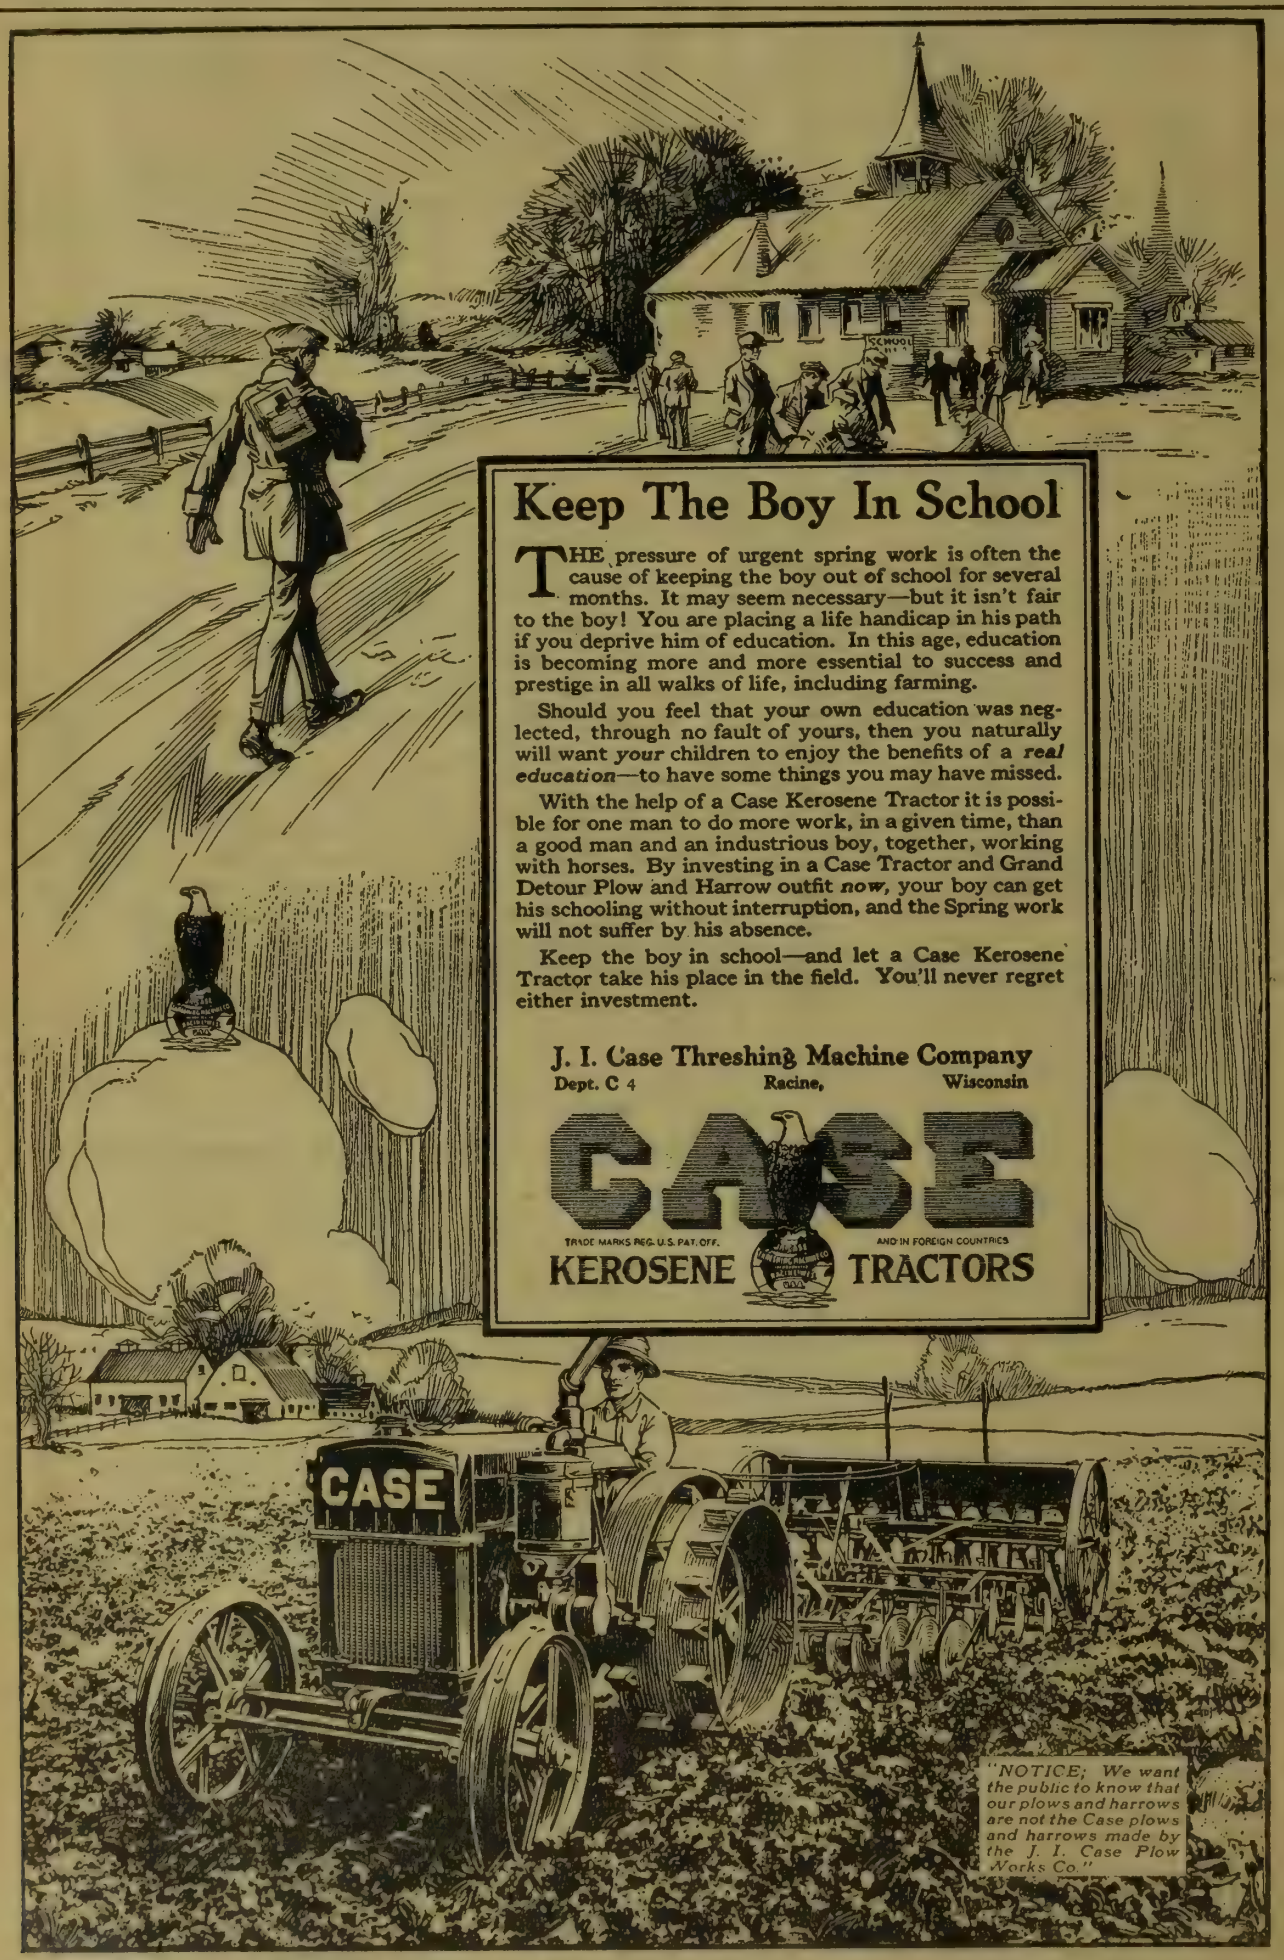
One should remember when planting that to get proper germination and sturdy plants the seed must be firmly embedded in well worked fine moist soil. The soil under the seed should also be in a fine friable condition that the rootlets may readily find sustenance. If the ground bakes over the drills or rows before the seed are up it is advisable to break the surface by raking lightly with a steel tooth rake. This should be done very carefully to avoid injury to the tender shoots.

Transplanting or setting out of plants should be done, if possible, on a cloudy day or late in the afternoon. Take off most of the large leaves from the plants to eliminate evaporation. Be sure to have the roots firmly set in the new place and apply about a pint of water to each plant to settle the dirt about the roots. If it is very bright weather protection should be given the newly set plants.

The latter part of the month the more tender things may be planted. Make your first plantings of sweet corn—Heath's Early and Golden Giant are the best; bush and pole beans, early cucumbers, summer squashes—try a few hills of the Fordhook; winter squash, melons and roselle.

If you intend planting potatoes this spring they should go into the ground this month. Late planted potatoes do not do well here on account of the hot weather at the time they are developing.

Thin out the beets, carrots, etc., that were planted last month and keep the surface of the ground worked to destroy weeds and make mulch. Be diligently on the watch for aphis and other insects. Peas and cabbage are apt to be attacked at this time. A wise gardener does not wait for the appearance of insects and diseases but sprays at reasonable intervals to insure against the likelihood of loss.



Keep The Boy In School
THE pressure of urgent spring work is often the cause of keeping the boy out of school for several months. It may seem necessary—but it isn't fair to the boy! You are placing a life handicap in his path if you deprive him of education. In this age, education is becoming more and more essential to success and prestige in all walks of life, including farming.
Should you feel that your own education was neglected, through no fault of yours, then you naturally will want your children to enjoy the benefits of a real education—to have some things you may have missed.
With the help of a Case Kerosene Tractor it is possible for one man to do more work, in a given time, than a good man and an industrious boy, together, working with horses. By investing in a Case Tractor and Grand Detour Plow and Harrow outfit now, your boy can get his schooling without interruption, and the Spring work will not suffer by his absence.
Keep the boy in school—and let a Case Kerosene Tractor take his place in the field. You'll never regret either investment.

Southern Arizona

By M. E. Bemis

PLANTINGS of the more tender vegetables may be made in March. At the same time most of the common varieties of vegetables which have been planted through the winter may be planted again for a succession. The list of the latter comprises beets, carrots, lettuce, radishes, spinach and mustard.

Asparagus may be set out and also tomato plants. Tomatoes may also be planted in the ground where they are to grow, and this is a practice that finds favor with some, although it is probable that the majority prefer to transplant.

March is the month for beginning plantings of beans. Stringless green pod is one of the most popular varieties. This is a bush variety and is as near stringless as any known. Black wax and Improved Golden wax are also bush beans that give good success. For garden culture beans should be planted in rows 18 to 24 inches apart and two inches apart in the row. One pound should plant 100 feet of row. Beans should be planted about 1 inch deep. Pole beans are not so popular, probably on account of the scarcity of sticks for poles. In the small garden some space may be saved by planting the pole varieties, but this saving is not so very great as they should be planted farther apart in the row and rows should be also farther apart. Kentucky Wonder may be planted early and does well. A native variety is the Aztec, claimed to have been discovered in the prehistoric ruins of the cliff dwellings. This bean somewhat resembles the lima but is more nearly round. It grows in large pods and is used both as a green bean and dry.

Corn may be planted this month. The sweet corn varieties are grown to some extent, but the variety which is best adapted to this dry climate is the Papago sweet corn. This is a sweet variety which was discovered on the Indian reservation of the Papago tribe and improved somewhat by selection. Corn is best planted in hills, for garden culture about three feet apart each way. It may be planted in furrows and covered about one inch deep. Later hoeings will gradually fill in the furrow, and later irrigations will be between the rows. It is doubtful if any variety of corn that can be grown in Southern Arizona is superior or even equal to the Sacaton Mexican June, which is the variety grown most largely for field culture both as a grain crop and for silage. For roasting ears this corn is almost as sweet as the best of sweet corn and as it yields well is to be recommended. The only disadvantage for the small garden is the high stalks which tend to shade too much other crops.

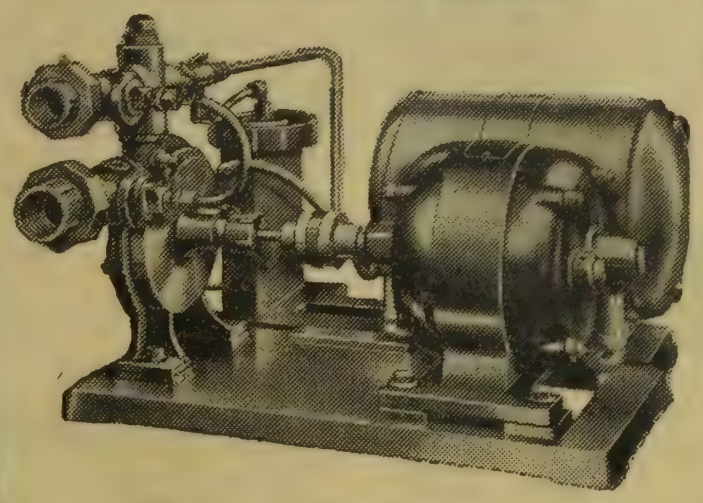
Cucumbers do very well some seasons and at other times, without any logical explanation, do not make the yields that are hoped for. Davis Perfect is a good variety. Early White Spine and Improved Long Green are popular varieties. Cucumbers should be planted four to six feet apart each way and covered one inch deep. Planting on the sides of ridges just above the water line is the best way. Half an ounce of seed should be enough for 100 feet of drill.

Peppers may be planted in the row where they are to grow or plants may be purchased and set out towards the latter part of the month when it is warm. The soil should be rich and the plants require considerable water. Plant on the side of ridges 30 inches from center to center and 18 inches apart. Anaheim Chili is a mild pepper that is also good dried. Chinese Giant and Large Bell are recommended varieties of the Bell types. Mexican Chili is a hot pepper that is immensely popular with the Mexicans. Pimento is a sweet pepper that is splendid for canning or salads

Pumpkins require rather too much room for the small garden. Not much is required, though, to produce a few pumpkins to furnish the table with an occasional pie. If planted six or eight feet apart and the seed covered one inch deep they should do well with ordinary attention. Small sugar, Japanese Pie and Kentucky Field are popular kinds to grow.

Potatoes will do well in light soils, but it is not advisable to attempt to

A Water System Without a Tank



JUST open the faucet—the motor starts, and you get a full flow of water fresh from your well, cistern, or other source of supply—service equal to the best city water works. Close the faucet, and the motor stops.

No tank to buy, to install, to keep clean and in repair. No tank to freeze, to leak or become water logged.

Westco

Tankless Water System

The simplest, most efficient, most economical system of water supply. Costs less to buy, to install, to operate, to maintain. All made possible by the wonder pump—the Westco—a pump with only one moving part—does not even require oiling.

For farm or suburban homes, for soft water supply in city homes — wherever a simple, compact, easily installed independent water system is needed —the Westco Tankless Water System is the thing.

Come in and let us show you the Westco Pump and explain to you just why the Westco Tankless Water System will give you best and longest service.

grow either Irish or sweet potatoes in heavy adobe soils. Early White Rose and Irish Cobbler are grown here.

Salsify or vegetable oyster should be planted in March. This plant will make considerable growth through the winter if planted in the fall, but is inclined, possibly because of the slow growth, to become woody and unfit for use. For this reason the spring plantings are advisable.

Summer squash should not be forgotten in the March plantings; both the White Bush and the Summer Crookneck do well. They should be planted about the same as cucumbers and are easy to raise.

Cantaloupes for the commercial crop are being planted at this writing (February 23) in the Salt River Valley. For the home garden they may be planted later and will possibly do even better than the early plantings. A variety that has come into favor here both on the local market and for shipping is the Improved Salmon Tinted. For the general crop, Rocky Ford and several kinds of Netted Gem are splendid cantaloupes. Watermelons also should be planted in March. Kleckley Sweet and Tom Watson are grown more than any other varieties. The Black Seeded Chilian has proved a favorite on the Phoenix market and always commands a better price than other varieties.

A few sunflowers in odd corners or where shade is required will furnish some chicken feed at little cost.

March in the Ornamental Garden

Southern California

By Ernest Braunton

IF YOU are going to garden during 1921 you should be at it now. At no other time of the year may you garden with such profit; at no time is nature more active. March is the one best month for making new lawns, renovating old ones and fertilizing all parts of the home grounds.

Prepare soil for all plants easily injured by frosts or that refuse to start during cold weather. Sow seeds of those too tender for earlier temperatures, for the hour of liberation is at hand. Seeds sown now will bring forth plants that doubtless will grow unchecked by nights too cool, as might occur earlier in the year. But days may come quite hot, in sharp contrast with cool nights, and a protective mulch of sifted stable manure is a fine protection against drying of surface soil. If this is not used one must sprinkle every day, or twice each day, where seeds shallowly sown should be germinating.

Last month we gave an extensive list of seeds to plant, also one of bulbs and tubers. All these may be planted in March. In fact this month's work may be merely a continuation of the February program, or the institution of the work in sections too cold for an earlier beginning. Dahlias, cannas, gingers, cyperus, papyrus, and all roots and plants held back for fear of frosts may now be planted with a fair assurance of safety. All sorts of propagation may be performed—seeds, cuttings, divisions, budding and grafting. A good hotbed is a great aid but not necessary to success if sufficient care is taken. Last week's article on chrysanthemum culture tells precisely how all cuttings should be made and cared for to bring the greatest degree of success. A final admonition is to garden every minute you can find to spare during the month of March.

Northern California

By A. R. Gould

TO the successful gardener patience is a virtue. Forethought is also an asset. We must plan and plant ahead if we would keep our garden full of flowers and be prepared to wait patiently for results if we wish to raise plants from seed or the small seedling stage. Furthermore, there will be insect pests and fungus diseases to fight, but most of these may be overcome and will make the work more interesting and the worker more observant. In this department also it is essential to keep a garden notebook and record dates of seed sowing, planting and periods of flowering. All this will be useful data to the grower and many details of cultural methods may be recorded in this way to prove of value for the future. Before any planting is done the holes for trees or shrubs must be carefully prepared and manured, and there should be some thought given to arrangement so that the taller growing subjects will be placed in the background and the smaller to the front, and several subjects of one kind may be grouped together and if the variouos colors are arranged correctly the whole may be very effective.

The Perennial Border

A well arranged perennial border is becoming more popular in our American gardens. There are a large number of perennials to select from and they last a considerable time in flower. In preparing the border deep trenching and manuring is essential, and it is only by such practical application that a successful border can be established, as it must be remembered that perennials are there to stay for some time and are not disturbed except for subdivision every two or three years. The following is a list of suitable subjects and we shall mention the taller growing first, giving the colors: Delphiniums in various shades of blue. Hollyhocks in shades of rose, white, yellow, pink and crimson. Anchusa italica, "opal" blue. Asters, or Michaelmas Daisy, all growing from three to five feet. Much smaller subjects are gaillardia grandiflora hybrids, old gold and yellow. Erigeron speciosus, blue, and Asa Gray, apricot. Gentiana Andrewsii, blue. Campanula persicifola, blue. Coreopsis grandiflora, yellow. Chrysanthemum, single flowered types in various colors. Centaurea montana, blue. Oriental poppy, crimson; Iceland poppy, yellow and orange. Pinks, Dianthus in variety. Primulas, polyantha and vulgaris. Silene alpestris, pink and Sweet Williams in various shades. Such a collection will not only provide a long display but might also be grown for cut flowers.

Annuals for Cut Flowers

There are many who are anxious to secure flowers from seed in a short time and now is the time to sow if summer bloom is required: Godetia, marigolds, calliopsis, salpiglossis, schizanthus, centaurea, scabiosa, nemesia, larkspur, Emperor branching, zinnias, shirley poppy, and mignonette. The last two should be sown in the place where they are to flower and thinned out. Sow seeds of the above in well prepared soil on a warm border or in boxes, and during the heat of the day they should be shaded from the sun. Keep the soil fairly moist and sow the seed thinly.

Roses

If pruning has not yet been attended to this should be done without delay and all dead wood removed. Dig in manure very liberally. This is also the time to plant your new roses, and you should include the following: Irish Fireflame, Sunburst, Ophelia, Los Angeles, E. Herriot, Hoosier Beauty, Geo. Dickson, Lady Hillingdon, Frau Karl Druschki, Edward Mawley, British Queen, Rainbow, Harry Kirk, Ulrich Brunner, Melody, A. R. Wadell, Paul Neyron, Hadley and Baby Doll. Roses thrive best in a fairly heavy soil. Good climbers are Beauty of Glazenwood, Cecil Brunner, Cherokee, and Banksia yellow and white.

Eremurus Himalaicus

This very stately plant from India grows to a height of eight feet and has beautiful white flower spikes. It requires a deep rich soil and will look effective in the perennial border or placed in a group by itself.

Lawns

These will require weeding and a general top dressing with a fertilizer such as guano, dried blood or bonemeal. It is also a good time to sow new lawns or fill in any bare spots,

FAIRY GOLD

In the lore that is known to our childhood,
The beautiful story is told
That under the foot of the rainbow
The fairies have hidden their gold.
Forever eluding but tempting,
The sunshine is bright on the rain,
And over the hills and the valleys
We follow the glory—in vain.

Though we stand where we thought it had rested,
Yet distant it ever appears;
For what seems the rainbow to others
To those at its foot may be tears.
The strongest of charms is upon it,
This treasure, which never is gained;
And bright, with a glory celestial
Is the goal that is never attained.
—Philadelphia Bulletin.

STAR LIGHT, STAR BRIGHT

By Clara Peterson

ONCE upon a time there was a little boy who had never had any fun. This was because he lived with an old, old uncle instead of the own dear mamma who had died when he was a baby.

The uncle's name was Old Toteman. That is, the villagers and the naughty children called him that, but little Dick called him Uncle Toteman because he was afraid to say the other.

Old Toteman worked in a blacksmith shop, and after school Dick had to help him instead of sliding down hill with the boys. From four until six he worked very hard, pumping the bellows to heat the iron horseshoes or holding the tallow candle which lighted the horses' hoofs, for Old Toteman.

Then they went home to supper and to bed. There was no fine, cozy time around the stove, for candles were expensive and it was foolish to keep the fire burning after seven o'clock.

The blacksmith shop wasn't a bad place in summer, for it stood at the edge of a beautiful wood and flowers grew up to its very door, except where Old Toteman threw cinders and killed them. But in winter it was desolate and cold. Dick's face burned on one side and froze on the other while he held the dripping candle and wondered anxiously whether the big horses would ever kick him, by mistake.

The boy really thought that this long, cold winter would never end. His red arms hung out far beyond his coat sleeves and his mittens did not even cover his wrists, so the bare space was always chapped and bleeding. Between this and his aching feet, Dick was glad to go to bed the minute he had rubbed on the hot mutton tallow his uncle grudgingly melted over the stingy flame.

But he did not always go to sleep. He would lie and look up at the stars, twinkling through the window. He was only eight and a half, yet the stars were the only friendly things he had ever known. He had invented names for the big ones and every night he talked to them.

Tonight his chapped wrists hurt worse than usual and his toes were icy cold. There had been only mush for supper and he was hungry, so he climbed quickly into bed and hugged his arms together under the quilt, playing that he had a little dog or kitten in them. Dick had never had a pet, but he imagined that the boys and girls who did have, must always sleep with them and so keep warm. You see, it never occurred to him that most children had snug, bright rooms and soft beds with plenty of covers.

He lay there holding his imaginary pet tight and whispering half aloud to the brightest star. The others had not yet broken through the clouds but Dick could see the faint pin points of light where they would appear, so he hurried and said his little heathen prayer, the only one he knew:

"Star light, star bright, first star I've
seen tonight,
Wish I may, wish I might, have the
wish I wish tonight."

And then he wished. He had been wishing the same thing ever since Christmas, when he had seen, all in one day, a boy with a Shetland pony, another with a dog in a bell covered harness, and a girl with a beautiful kitten in a basket.

"Dear Star, please send me a pet, any kind, just a pet."

Dick never stopped to think that Uncle Toteman would soon put an end to that if the pet really did arrive.

Then he went to sleep.

The next day was Friday and school seemed harder than usual. Dick was not brilliant and the teacher did not indulge him. He was almost glad to get away at four o'clock and run to the shop.

The day was cold and already growing dark. The home lights were shining through the cheerful curtained windows, but Dick did not stop to envy the other children. He ran as fast as he could so Uncle Toteman would not scold, and breathed a little sigh of relief as he reached the cinder path to the shop door. It would be warmer inside.

At that second something ran in front of him and stopped a few feet away—a black, furry ball. Dick could hardly tell it from the bushes. His heart beat wildly. His pet! It must be his pet. Sealthily he crept toward it, but the ball did not move and he gathered it into his arms.

Just then the light from the forge shone brightly through the narrow window and Dick saw that he held a rabbit, a beautiful, soft, long-haired rabbit with shining eyes. He heard Uncle Toteman coming to the door and in panic realized that he must never see the pet.

Desperately he ran to the back of the shop. What could he do? The answer loomed before him. The old shed where Uncle Toteman kept his coal and where no one but Dick ever entered. (It was his evening task to replenish the big coal box beside the forge.)

Dick knew there was an old pile of burlap in the shed. He unlatched the door and thrust the rabbit inside. Old Toteman was calling gruffly:

"Hey, Dick, I heard ye. Come get busy with the bellows."

Dick ran through the open door and pumped up the flame in a second. He was so happy that he smiled all over but Old Toteman only frowned. When boys were happy there was some deviltment in the air.

At 6 o'clock the work was finished and Dick ran out while Toteman put on his overshoes.

The rabbit had huddled into a corner of the burlap and seemed asleep.

Now this had been a particularly happy day for Dick because that noon he had found a rosy red apple in the schoolyard. He had meant to eat it after he got into bed so he wouldn't mind the cold so much, but now he took it out of his pocket and looked at it. The rabbit moved restlessly and without a sigh Dick put the apple down before it. In the dim glow from the shop he could see it nibble the ruddy skin with the greatest relish.

"Tomorrow I'll bring you more, Bunny," said Dick fondly. "I bet you'd like to come home and sleep with me. I'd keep you nice and warm. But we'd better not, just yet," he added, embarrassed.

"I'll tell you about it later."

It would never do to let the rabbit know that it would be unwelcome at Uncle Toteman's.

The old man was standing at the end of the path, waiting for Dick.

"What's the matter now?" he asked angrily. "Don't you be runnin' off with no boys. They're a bad lot."

"All right, Uncle Toteman," said Dick meekly, glad he had hit so far from the mark.

"I never do play with the boys, anyway, and they don't with me."

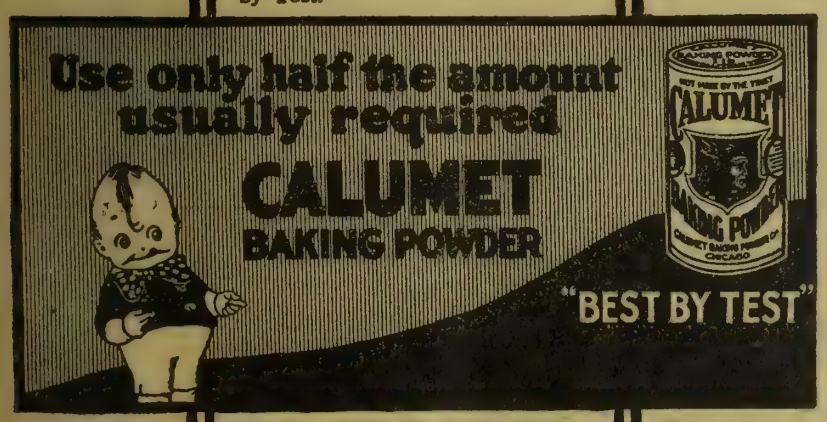
Uncle Toteman cooked vegetable soup for supper and Dick's eyes sparkled at sight of the potatoes, the cabbage and the big carrots. Didn't he know what rabbits loved!

You may be sure that Uncle Toteman did not waste much of the vegetables, but Dick carefully picked the

YOU don't use as much of Calumet as you do of most other Baking Powders. It has more than ordinary leavening strength. You save about half.

You don't pay a big price for Calumet. It's sold at a moderate price—that represents another saving.

You don't feel uncertain as to results. Bakings never fail—because Calumet never falls below the proven standard of "Best by Test."



It possesses the highest quality ever put into a Baking Powder. Contains only such ingredients as have been officially endorsed by United States Food Authorities.

For weeks, for months, it keeps as fresh and full of strength as the day it left the Calumet Factories, the World's Largest, most Sanitary and Modern Baking Powder plants.

Pound can of Calumet contains full 16 oz. Some baking powders come in 12 oz. instead of 16 oz. cans. Be sure you get a pound when you want it.

Calumet Gold Cake Recipe

Yolks of 8 eggs, 1¼ cups of granulated sugar, ⅔ cup of water, ½ cup of butter, 2½ cups pastry flour, 3 level teaspoons Calumet Baking Powder, 1 tablespoon of vanilla. Then mix in the regular way.

Ask for Ghirardelli's Ground Chocolate at the store where you do your trading. Never sold in bulk but in cans only. In this way Ghirardelli's retains its flavor and strength—the two most important elements of good chocolate.

IT'S simple enough—the chocolate-sweetness of Ghirardelli's makes additional sugar unnecessary. You lose nothing of its deliciousness, its flavor, its strength, when you "pass up" the sugar. For Ghirardelli's "stands on its own feet" as a complete food beverage—sufficient unto itself!

Say "Gear-ar-delly"

Correspondence with the advertisers in the California Cultivator will convince you that their articles will save you money.

succulent scraps from the trash basket and stuffed them into his pocket.

He sat down to the table with such a shining face that Uncle Toteman looked at him suspiciously.

The soup was very hot, and very good—for Toteman soup. Dick was allowed a big bowl full and when he had finished, his little stomach was replete.

Taken all together, it had been a deliciously happy day, and when Dick crawled into his sagging bed and looked up at the stars, he was so comfortable that he even forgot to thank Star Bright for giving him his wish. He just gazed for a moment with drowsy eyes, and then went to sleep, his arm crooked lovingly about a rabbit that was not there.

The next morning Uncle Toteman had Dick help him carry Farmer Brown's buggy wheel to the shop, so it was easy to see the rabbit. Dick's heart pounded as he opened the rickety door. What if it had dug its way out or died of loneliness!

But there it sat on the burlap, its brown eyes twinkling. It gobbled the vegetables like a little pig and Dick could hardly contain his joy until he found that the rabbit was lame and dragged one leg when it hopped.

Dick comforted it cheerily.

"Never you mind, ol' Bunuy," he crooned. "It'll be spring any day now. Then I'll take you to the woods and you can hop around and get well."

The weather did grow warmer after that, but undoubtedly it would have seemed warmer to Dick anyhow for the rabbit thrived wonderfully. It was all he could do to keep from bringing out the pet and exhibiting its wonders.

Several noons he had gone without his dinner to do errands for a penny or two and as the grocers were generous to the lonely little fellow, the rabbit had fared well. It was truly an exceptional rabbit for it followed Dick around the shed, like a dog, and snuggled up to him whenever he sat down.

(Continued next week.)

HOUSEHOLD QUERIES

Nut Bread

Here is another recipe for nut bread which is particularly good:

Three cups flour, 4 teaspoons baking powder, ½ cup sugar, 1½ cups milk, 2 eggs, 1 cup walnuts, 1 scant teaspoon salt. Mix dry ingredients together and add milk, well beaten eggs and nuts. Put in pan and let stand 20 minutes. Bake slowly for 35 minutes.—F. K., Los Angeles.

Grated Potato Cakes

Grate or grind with a very fine cutter eight large, not largest, potatoes. Salt to taste. Break into this from five to seven (we like seven) eggs, and beat with spoon until thoroughly mixed. Do not use any flour. Put two or three tablespoons fat in skillet and when hot put in two or three, depending on size of skillet, large spoonfuls and spread, then cover till ready to turn. If there is not enough fat in skillet, cake will look dry when turned. Serve with bread and butter and black coffee—a whole meal in itself. Mrs. A. W. Leitske, Dinuba.

Dye for Rag Rugs

I have been much interested in the way you have helped many to solve their difficult problems, and now I come to you with mine. I am much interested in making the old fashioned rag rugs which are used so much now but have been able to find no dye that will not fade with the light and washing. Can you tell me how to get fast colors, especially blue? I have wondered how our grandmothers and great grandmothers dyed their threads such beautiful fast colors for weaving cloth.—An Interested Subscriber, San Fernando.

Who can help this inquirer? Do any of our housekeepers know what dye our grandmothers used on the wonderful old blue and white counterpanes, now surely as rich and beautiful in color as the day they were woven?—Ed.

The Cultivator Patterns

BE SURE TO SEND SIZE

3522-3509. Ladies' Costume.—Blouse 3522 cut in 6 sizes; 34, 36, 38, 40, 42 and 44 inches bust measure. Skirt 3509 cut in 7 sizes: 24, 26, 28, 30, 32, 34 and 36 inches waist measure. To make this model for a medium size will require 6⅜ yards of 44 inch material. The width of the skirt at the foot is 2⅝ yards, with plaits extended. Two separate patterns 10 cents for each pattern.

3123. A Dainty Frock.—Cut in 4 sizes; 4, 6, 8 and 10 years. Size 10 will require 4 yards of 27 inch material. Price 10 cents.

3577. Work or Morning Dress. — Cut in 7 sizes; 34, 36, 38, 40, 42, 44 and 46 inches bust measure. For a medium size 6 yards of 36 inch material will be required. The width at the foot is 2¼ yards. Price 10 cents.

"BRIGHT LIGHTS" FOR THE FARM

As a jazzy, tuneful melody, "How You Gonna Keep 'Em Down on the Farm?" has long since been discarded. But as an actual problem it still holds the attention and consideration of many a mother and father of rural America. How is this trend of country boys and girls to the cities being checked? For it is being checked to a noticeable extent, even though the progress is slow.

"By making country life livelier and more attractive," might be a general answer to the problem. But that brings up the question, "How?" And this question is best answered by the findings of investigators of the research division of the Home Economics Society.

In a recently completed survey which covered various rural sections of several states, these investigators found that modern conveniences and labor saving devices in and about the farm home are the most importaant factors in making young men and women more satisfied and contented with rural life. Many of the pleasures and conveniences that they used to go to the cities for are being taken to the farm.

Automobiles, player pianos, talking machines, good magazines, water plants, washing machines, tractors, log saws—a score of other devices all are playing a part in adding pleasure and eliminating discontent on the farm and keeping the boys and girls at home. Yet there is another factor which, according to the survey, is exerting an even greater influence than any of the foregoing in "Keeping 'em down on the farm."

"Bright lights"—that's what is helping to keep them on the farm—instead of luring them away!

Bright, cheerful light for every task in the home, and for every pleasure, reading, playing games, dancing, and for just sitting around the family circle—works for a happier home and a more contented family. And the means of this happiness and contentment is easily within the reach of every rural resident.

THE RIGHT WAY TO BOIL HAM

The discussion of ways to boil ham may seem to some entirely superfluous, yet have you never noticed that some hams retained that rich red color and perfect taste, while others have a brownish color and the meat comes apart? This difference lies in the manner of boiling. A good ham put on in cold water and cooked slowly, or allowed to stand for awhile without cooking, will lose much of its nutrition. The proper way to cook a ham is to put it on in water that is already hot, just beginning to simmer. If it can be kept at this temperature, which is a few degrees below the boiling point, so much the better. At any rate it should not boil vigorously. For every pound of ham let it boil a quarter of an hour. Thus a 16-pound ham would require four hours to properly cook. When put in hot water the outer layers of meat are cooked at once, thus preventing the escape of juices which takes place in cold water. Let stand till cool in water in which it was cooked.

JELLIED MEAT

One cup of beef which has been cooked and put through food chopper, half cup bread crumbs, salt and pepper to taste, mix well. Stir into this two-thirds cup of boiling water which has had one-half an envelope of gelatin dissolved in it. Pack in a tin and set in a cool place, after which it can be sliced.

EAT MORE RICE

Some people do not like rice. This is largely because they do not know how to cook it properly or how to combine it with other foods. When properly prepared there is no better or cheaper food than rice and no other food can equal its combination of deliciousness, economy and high food value.

Rice is quickly cooked and easily digested and is completely utilized by the body. A well cooked dish of rice can safely be given to convalescents and young children. Its nutritive value, its palatable merits and its moderate cost have long made a strong bid for popularity, but for some incomprehensible reason the American housewife has not accorded it deserved recognition.

It will also interest many to learn that in California we grow a type of rice which is the finest cooking rice produced anywhere. The reason it is not more popular is because most of us don't realize that our Golden State short grain is superior to the long grain rices of the Orient and the Southern states. The mellow, sweet California rice meets with instant demand wherever its qualities are understood, and there is no food superior in flavor and wholesomeness.

The Rice Association of California is asking consumers to "Buy a Bag of Rice" because there is a serious marketing crisis this year due to high costs of production and low market conditions. Regardless of this situation, which is serious, we urge housewives to eat more California rice because there is no better or cheaper food to be had anywhere in the world.

PLAN HOME WISELY

The attractiveness of a home isn't dependent on the amount of money spent on it. A small and inexpensive house may be as beautiful in its way as a large and costly mansion. The essential thing isn't the cost. It is the good taste of the designer.

The old lesson is repeated. "With what do you mix your colors?" was the question put to the famous painter. "With brains, sir?" was the retort. The house needs to be designed and planned with brains.

OLD FURNITURE MADE NEW

The bright spring days are the best time for making over old furniture around the house. The modern painted furniture that looks so attractive in the stores owes its appearance to paint. A little grey or white enamel will soon convert an old, dingy piece into a new and stylish adornment. Chairs, tables or other pieces of which the grain of the wood stands out can be touched up and preserved with varnish stain, giving any desired effect. Almost every attic contains some article of furniture which has been discarded because of its appearance or some easily repaired break. At the present cost of things, it is the best economy to repair and repaint, and remember, by "saving the surface" you save all.

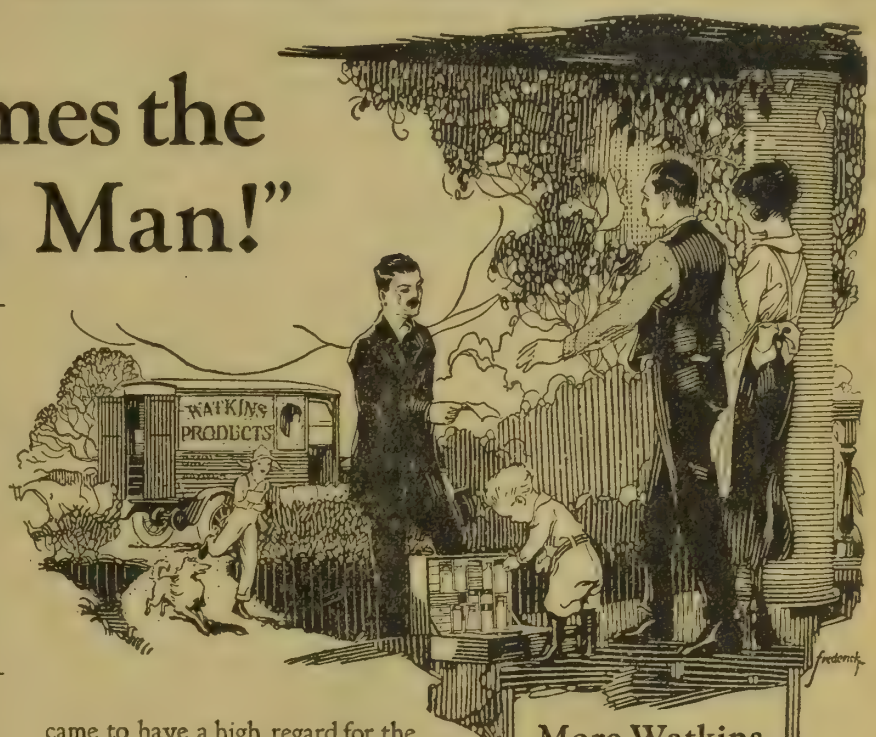
CHICKEN AND OYSTER PIE

Stew two good sized chickens till the meat is ready to fall from the bones. Arrange the meat in layers in a large baking dish, with large oysters between. Boil down the chicken juice till about one pint, add the juice from oysters and thicken with one tablespoon flour. Season and pour over chicken and oysters. Cover with a good crust and bake brown.

When chopping dates, citron, raisins, etc., sprinkle on some of the flour that would be used anyway and the chopper will not be gummed up.

"Here Comes the Watkins Man!"

Do you realize exactly what that means to you? Delivery direct to your door of 137 Watkins products; economical prices; a standard of quality established through more than fifty years in business. Twenty million satisfied users are served by Watkins Men today



MORE than fifty years ago, the first Watkins wagon jogged over the countryside. Farmers along the way were astonished at this novel method of selling goods.

Needless to say, they were pleased at the thought of having home necessities delivered *to their very doors*, thus saving them immeasurable time and trouble. But that was not the only thing they liked about the Watkins plan.

It soon became apparent that in addition to convenience, the Watkins method of selling *direct to the user*, through authorized Watkins Retailers, meant a substantial saving of money to the householder. And in addition to that, it was not long before people came to have a high regard for the reliable quality of Watkins products. The quality never varied—was always the best.

And so the Watkins idea grew. Today twenty million satisfied users, on farms, in small towns and in large cities, are being served by more than 4,000 Watkins Men. The Watkins line has grown until now there are 137 products.

Millions of families find it worth while to hold their orders until the Watkins Man calls at regular intervals. You, too, will profit by Watkins Service, Watkins Saving, Watkins Quality. If a Watkins Man has not called recently, won't you write to us? We'll take pleasure in seeing that you are supplied.

More Watkins Men Needed

to help supply the tremendous demand for Watkins quality products, comprising 137 household and farm necessities sold direct to the home. The experience of over 4,000 successful Watkins Men points the way to a real opportunity for you. Desirable territories, country and city, are open for responsible men who are capable of serving Watkins' customers in the manner which has made this the largest and most successful company of its kind in the world.

Write today for full information regarding how you can become a Watkins Man and what it means to you.

Among the 137 Watkins products are: Livestock and Poultry Preparations; Household Medicines, Liniments, Balsams; Spices, Extracts, Coffee, Baking Powder, Washing Compound, Tube Flavors; Soaps, Shaving Cream, Perfumes, Toilet Waters, Face Creams, Powders, Tooth Paste, Tooth Brushes; Automobile Supplies, Tires, Tubes, Spark Plugs, etc.

SECOND ANNUAL STOCKMEN'S WEEK

(Continued from Page 309.)

the complete plans for the week and outlined the purpose and hopes of his division in arranging the program. B. O. Cowan of Santa Monica, formerly assistant secretary of the American Shorthorn Breeders Association, represented that organization and drew from his great fund of experience much that was interesting and instructive. Mr. Cowan held forth great encouragement to the breeders of registered Shorthorns and stated that it was his opinion that the next few years would see a very wide expansion of the industry due to the economic conditions that are facing the cattlemen of the United States. C. E. Ratchford of the forest service discussed range and forestry problems. Ratchford, while deploring the average quality of the beef cattle running on the ranges of this state, said that there was a very marked and constant tendency on the part of California cattlemen to look to the pure bred bull as a means of increasing the efficiency of their cattle. Dr. Elwood Mead of the University of California told of the policy adopted by the settlers on the Durham and Delhi colonies to incorporate livestock in their activities and of the plan to confine themselves to one breed of each class of livestock. The afternoon of the first day was given over to the annual spring sale held by members of the California Shorthorn Breeders Association. Seventy-eight head of bulls and females were sold for an average of $268.

T. H. Ramsey of Red Bluff, president of the California Cattlemen's Association, presided at the Wednesday sessions. During the morning the annual meeting of the Pacific Coast Hereford Cattle Breeders Association was held. Paul G. Redington of the forest service discussed the stabilization of grazing permits, and T. N. Lorenzen, also of the service, discussed phases of range management. Lorenzen particularly emphasized the question of overstocking and declared that only through a proper adjustment of cattle to range, based on the carrying capacity of the feed, could that capacity be maintained and increased. Lorenzen cited many instances to demonstrate the effects of careful management.

One of the most impressive addresses of the week came from John E. Painter of Roggen, Colorado, who came to the Coast to represent the American Hereford Cattle Breeders Association of which he is an officer. Mr. Painter is regarded as one of the most successful and clear thinking men in the business, and the message that he delivered to the cattlemen of this state was based upon his actual and successful experience. Painter told his hearers of his operations covering more than 30 years and ranging from the handling of the plainest sorts of range cattle to the maintenance of a large herd of registered cattle. He demonstrated in no uncertain terms the value of better blood and cautioned the cattlemen of this state against a policy of ignoring the worth of better cattle. Painter also pointed out the sound features of the pure bred cattle business and stated that he knew of no section that held out greater inducements for the production of high class cattle than he had found in this state. He called attention to the fact that now was a particularly opportune time to engage in that phase of the business, as values were at the low ebb and certain to improve.

Wednesday afternoon 56 head of Herefords, including bulls and females, were sold at auction for an average of $236.50.

A mass meeting was held in the University Farm Auditorium Wednesday evening. Dr. H. C. Gross of Eureka represented the American Jersey Cattle Club and following a motion picture depicting many of the famous animals of the breed, addressed the meeting, and aside from setting forth the many merits of the Jersey breed he took occasion to urge the Jersey breeders of this state to take an increased interest in testing their cows. Dr. Gross pointed out that there were over 200 Jersey breeders in this state but that only 25 were members of the American Jersey Cattle Club. He also stated that about three-fifths of the breed records were held by Oregon cows and that no breed record is held by a California cow.

Walter Mulford, acting dean of the college of agriculture, told of the relation of the college to the animal husbandry industry of the state and briefly outlined many of the problems that are now the basis of investigation. Dean Mulford especially urged the livestock interests to regard the college as their own organization for furthering their work and invited suggestions as to how the college could best serve the industry.

Dr. W. H. Walker, president of the California Farm Bureau Federation and vice-president of the American Farm Bureau Federation, went into the details of that organization and told of many cases in which the federation had been able to serve the agricultural industry in definite manner.

R. N. Wilson, secretary of the agricultural legislative committee, took occasion to tell of the work of his organization and briefly discussed pending legislation that is of interest to agriculture. Wilson called particular attention to several bills before the legislature that the agricultural interests regard as dangerous. Among the bills he referred to were assembly bills Nos. 40, 60, 240 and 450 and senate bills Nos. 440, 744 and 685.

The third day proved to be one of the best of the week. That day was generally designated as "Dairymen's Day." J. M. Henderson Jr., president of the California Milk Producers Association, presided at the morning session, and Sam H. Greene, secretary-manager of the California dairy council, held the chair during the afternoon.

J. E. Dorman, chief federal dairy bureau, Salt Lake City, discussed the general dairy situation of the West and pointed out that from now forward dairymen must give greater attention to improving their cattle in order to widen the margin between cost of production and selling prices.

Sam H. Greene drew attention to the growing use of substitutes for dairy products and urged that legislation be enacted to help meet that competition and stressed the importance of educating the public to the real difference between the real article and the substitute.

C. W. Rubel of the college of agriculture suggested that the time was at hand when this state should line up in the pure bred sire campaign that is being waged by the United States department of agriculture. Rubel said that at present most of the organized work in this state was among poultrymen.

E. L. Westover, western fieldman for the Guernsey Breeders Association, urged the organization of local breed associations.

Professor F. W. Woll, who is in charge of the state dairy cow competition, read a paper on the accomplishments to date. L. W. Wing, formerly professor of dairy husbandry at the Oregon agricultural college, and now in charge of the Elkhorn Ayrshire herd, read a paper on the problems of the dairymen in the coast region. Frank L. Morris of Woodland presented an excellent paper on the development of a high producing herd. (The paper will appear in the Cultivator.) Sam H. Greene told of his efforts to organize a Pacific Coast Dairy Show to be held at Stockton next November and asked for the support of the various breed associations.

The California swine breeders held their annual meeting Friday, February 24, J. I. Thompson, Davis, acting as chairman. Prof. C. W. Rubel gave a very interesting talk on the growth and development of the hog auction sales as conducted by the farm bureau. This system, he declared, has saved thousands of dollars for the pork producers of the state through cooperative marketing. In many localities where the average farmer has only a very few hogs and it would be almost impossible to find a means of disposal, and out of the question for the feeders or shippers to assemble a full car at any one time, this system has encouraged pork production and has made it possible for the man with only five or six fat hogs to sell them as cheaply and profitably as the man producing hogs in carload lots. Prof. Rubel called attention to the fact that this system of marketing had been extended until farm bureau sales were now being held at most of the pork producing centers of the state and would be extended as fast as conditions warrant. He emphasized the need of cooperation by all pork producers to help improve and extend this system.

C. B. Cunningham, Mills, former president of the California Swine Breeders Association, spoke on "Closer Cooperation by the Breeders of Pure Bred Swine." Mr. Cunningham laid

Here! The Famous Sharples Suction-feed Separator Now Priced so Low that Every Farmer Can Own One!

FOR the first time in the history of dairying, farmers can now buy for **less than fifty dollars,** a religable, high-grade, standard cream separator, and the **only one** that skims clean at any speed! The Sharples Separator Company, with the oldest and largest separator factory in America, now offers the average American farmer the most certain profit-maker ever put on the market —the new

Sharples TYPE C SUCTION-FEED CREAM SEPARATOR

$44

(Cash f. o. b. factory)

THIS TYPE C separator has every mechanical feature of the larger capacity types of the Sharples Suction-feed Separator—the most reliable separator in the world and the ***only*** separator that ***skims clean at any speed,*** and delivers cream of even density at any speed. The only difference: Type C is ***smaller***—capacity 200 pounds; weight 40 pounds; 22¾ inches high.

Thousands of dairymen who have been forced to use "cheap" machines, that lose precious butterfat and go to pieces quickly, can now get ***100% profit from their butterfat*** with Type C Sharples.

So great is our confidence in its efficiency, we plan to build 100,000 TYPE C machines this year

and it is on this basis of big and economical production, and of our unbounded faith that it will find a waiting and an enthusiastic market, that we price it at $44. Mass production on a gigantic scale will enable us to do what was never done before—offer a high grade, high class, standard separator at a price any farmer can afford.

The TYPE C Sharples is GUARANTEED to the limit. And a *Sharples* Guarantee means that the great Sharples business is back of the separator as long as it is in use. Durable—the only separator that skims clean at any speed —the only separator with a perfect automatic oiling system —the only separator without discs in the bowl—easiest to clean and keep clean; easy to operate—low cash price (only $44) or, if you wish, easy monthly payments arranged under our special partial payment plan.

This new Sharples has everything in the standard Sharples Suction-feed! ***It's the greatest opportunity you've ever had to get more profit from your dairy.***

You can afford to pay $44 for this wonder-separator. ***You can't afford to be without it.*** It will earn its initial cost so quickly you'll be amazed.

The TYPE C SHARPLES skims clean at any speed

No other separator, ***regardless of price,*** can skim clean at any speed. ***Sharples suction-feed principle is patented.*** And few of the so-called "cheap" separators skim clean ***at any time.*** Yet—$44 will buy you this standard Separator that gets ***all*** the butterfat ***all*** the time, at ***any*** speed! TYPE C SHARPLES will save you money ***now*** when you need every possible cent of profit.

200-LBS. CAPACITY

Large enough to skim all the milk you get in the average farm dairy of a few cows. Small enough to enable us to sell Type C for a price that you can easily pay. And on easy terms if you wish.

WILL OUTLAST ANY OTHER

machine of its kind. The same expert workmanship that stands behind the larger capacity Sharples Separators insures 100% efficiency and life-long durability in Type C Sharples. And this great Company ***absolutely guarantees*** Type C in every way. We experimented several years to prove Type C perfect. ***We will stand squarely behind every machine we sell.***

EASY PAYMENTS

You can either pay the entire cash price now, or you can arrange to pay under our easy partial payment plan with a small cash deposit and balance in easy monthly payments.

GET THE FACTS—Write Today

Learn how this wonderful new-type Sharples Separator will save its low purchase price over and over again by saving valuable butterfat that the ordinary separator invariably loses. Better still, send us check or money order for $44, tell us the name of your dealer, and we'll ship you profit-maker TYPE C Separator without delay, f. o. b. West Chester, Pa.

All Sharples Suction-feeds Reduced in Price!

Now's the time to buy your new separator. Altho manufacturing costs, prices of materials and labor costs have not as yet materially decreased, Sharples have anticipated lower prices for farm machinery after this readjustment period is over. Hence, prices of all standard Sharples Suction-feed Cream Separators are ***reduced over 20%.*** Prices are back to practically prewar level. Sharples share readjustment losses with the farmer. Remember—you can now buy the standard Sharples Suction-feed cream separator —at lower prices than for years past. And Sharples Suction-feed is the ***only*** separator that skims clean at any speed. ***Get in touch at once with your Sharples dealer—or write us for literature.***

GUERNSEY BULLS

BETTER MILKING

N. J. Daysh, inventor of the De Laval milker, is now on the Pacific Coast and is giving first hand instruction in the operation of the milker. Mr. Daysh only recently came from the headquarters of the big concern in New York and will remain some time on the coast working in connection

N. J. Daysh

with the salesmen. He has made a life study of dairying and especially of milking machines. His first work in the dairy field was in New Zealand and for the past ten years he has been engaged in perfecting the milking machine. This particular one has only recently been put upon the market. It is declared to be 100 per cent efficient and it is to secure its full efficiency that Mr. Daysh is making this trip.

MEXICO BUYING CATTLE FROM ARIZONA

Mexico, which for a great many years has supplied beef cattle to the United States in large quantities, has of late become an important market for American meat animals, including cattle, sheep and hogs, says the Arizona Cattleman and Farmer.

Many shipments to the packing houses of Mexico City and Tampico have been reported during the past few weeks from Kansas City and Fort Worth, while a carload of steers from Southern Arizona was delivered at the Mexican national capital recently.

This change of situation, in which Mexico has become a consumer instead of a producer, is attributed by local cattlemen to the fact that the range country south of the Rio Grande has become practically impoverished of livestock, due to the years of revolution, when many large stock raisers were forced to quit because of unsafe conditions away from thickly populated centers, and because thousands of beef cattle and sheep were stolen by bandits.

Recent information reports several additional carloads of fat steers, sheep and hogs shipped from Kansas City within the past few days to Tampico and the Mexican capital.

SOLDERING

Farmers have a great deal of soldering to do. Oftentimes when it is desired to mend something it is found that the supply of soldering flux has been used up. It is very easy to make a good flux by dissolving pieces of zinc in hydrochloric acid. The reaction forms a solution of zinc chloride. The formula? Just keep adding zinc to the acid until no more chemical action is observed. The solution can be kept in a glass bottle and applied in the usual way.

Decline of three per cent in retail food prices in January as compared with December is reported by the bureau of labor statistics of the department of labor. The greatest decrease, six per cent, was reported for Los Angeles and Manchester, New Hampshire.

BICKMORE'S GALL CURE

ON COWS

Sore teats mean less milk. Rub ointment into teat and wipe away all excess with a cloth. Teats healed and softened over night. Excellent for caked udder, wire cuts, cracked hoof, etc. Write to The Bickmore Co., Box 343 Old Town, Me.

ANOTHER GREAT HOLSTEIN RECORD

Another California Holstein cow has completed one of the greatest yearly records of milk and butter production the breed has yet recorded. Adirondac Wietske Dairy Maid, owned by Bridgford Holstein Company, Patterson, finished her year on February 12 with the tremendous production of 31,900 pounds milk and 1,296.5 pounds butter, the third highest milk record in the United States. The records made by this great cow have been consistent throughout her lifetime to date. As a senior three year old she made 20.03 pounds butter from 487.7 pounds milk in seven days. As a four year old she made 27.73 pounds butter from 560 pounds milk in seven days. As a five year old she made 30.38 pounds butter from 624.3 pounds milk in seven days. As a six year old she made 41.02 pounds butter from 831.7 pounds milk in seven days. This year she completed her first yearly record with the great production given above, and is due to calve again in April.

Adirondac Wietske Dairy Maid

Adirondac Wietske Dairy Maid is unquestionably one of the really great cows of the breed. In flesh she weighs over 2,000 pounds, has a tremendous girth and middle, with a well balanced udder of good texture. She is the sort of cow that the eye would credit with any reasonable production. She has two sons in service to date, one, King Abbekerk Johanna Segis, sold as a yearling at public sale to W. F. Mitchell, Visalia, for $5,000, and is in active service in Mr. Mitchell's herd. The other son, Sir Johanna De Kol Rag Apple, by Sir Pledge De Kol Korndyke, heads the herd of H. E. Cornwell, Modesto. She also has two splendid young daughters, both under milking age, both of which are in the Bridgford Holstein Company herd.

TRUTH IN FABRIC

American textile manufacturers have been so persistent in the use of reworked rags in "all wool" cloth that they have caused a reduction of 3,800,000 in our sheep population in the last two years and of 8,566,000 in a decade. If a way is not soon found to get the public demand for virgin (new) wool cloth back into touch with the wool growers, the continued reduction in the flocks will eventually produce a clothing situation worse than any experienced as a result of the World War.

The French-Capper Truth in Fabric bill does not provide that textile manufacturers shall use only virgin wool in clothing. It simply requires that they shall stamp their cloth with its content of virgin wool and of shoddy, cotton or silk. Of course, we expect that the labeling will tend to increase the demand for pure virgin wool cloth and increase the price of wool to a sum allowing shepherds a living profit, but more than that we neither seek nor expect, especially with nearly a billion pounds of virgin wool available for manufacture in American storehouses.

HIGHEST PRODUCING JERSEY

We mentioned in last week's Cultivator the fact that Raleigh's Gertie's Tulip now holds the record as the highest producing Jersey for age in California, but failed to mention the fact that this fine youngster is the property of Dr. H. G. Gross of Eureka, Humboldt County.

Making Ends Meet

CONDITIONS are changing very rapidly in the farming business. Lower costs of production are becoming absolutely necessary, for production costs at the present time are far out of proportion to selling prices. There is little possibility of material advances in the prices of food products for some time to come. There are the same laws operating with respect to these as to all other products which are today on the decline, and it is human nature for purchasers to refrain from buying largely on a falling market.

There was profit to the farmer in grain, fruit and cattle at pre-war prices simply because the production cost was then in proportion. If the prices of labor and supplies which the farmer has to buy decline proportionately with those of what he has to sell we shall again reach an equilibrium, but from all present indications this will be only partially accomplished. The probability is that the farmer who follows the methods of 1910 will labor under increasing difficulties in making both ends meet.

Nearly every line of producing business in the United States is up against the very same condition. The large manufacturers realize that no matter what reduction in labor takes place it will not be sufficient to offset the decrease in the selling prices, and the result is that most manufacturers are now spending large sums of money equipping their plants with new machinery and adopting methods that will result in a greater output of products with a smaller amount of manual labor. This is the only method they know of coping with the present conditions.

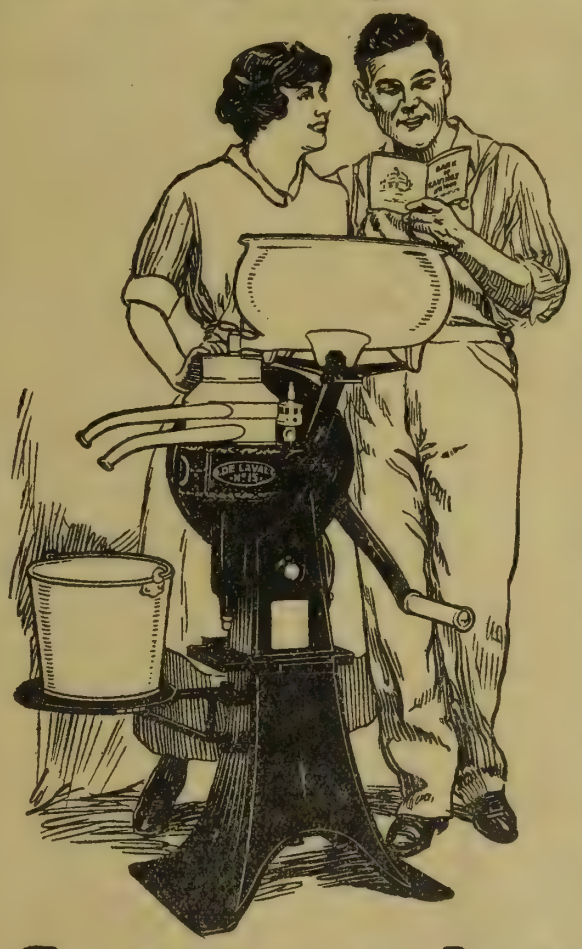
If such improved equipment is advantageous to the large manufacturer it should work similar results for the farmer and stock raiser. The time has come when it is necessary for farmers and stock raisers to get away from the methods that are of the past and to put their money into equipment that will enable them to increase their output at a decreased expense. A successful manufacturer figures that when he can get a machine that will increase the output of any of his products to such an extent that the increased returns over his present methods will pay for a new machine in five years, it is a good investment, especially when he figures that the life of the new machine is ten years. He doesn't figure that the discarding of the old machine he has been using is an expense — he counts it an investment; and experience has proven many times that it is a wise investment.

It is unfortunate that the average farmer and stock raiser has never thought very strongly along these lines; but conditions are going to make it necessary in the future. Up to date business methods are just as applicable to the farmer as to any other line of business.

For instance, a hog raiser realizes that to get the best results from his hogs in the way of putting on fat it is necessary to feed and water at specified hours each day. To do this by the usual methods means that a man must get up at a certain hour each morning, go to the hog lot and put in from half an hour to an hour, depending upon the number of hogs; and the same thing is necessary at a regular hour near the end of the day. Even with all this labor expended in hand feeding and watering, it has been proven by agricultural colleges that a proper type of self feeder will put on the same amount of flesh in from 20 to 30 days less time.

The best type of automatic feeder will cost about $35 and should last five years with active use. Now if the feeder will do what the agricultural experts say it will do, that is, save 20 to 30 days in bringing the pigs to market weight and condition, it will certainly show itself a good investment on that score alone, to say nothing of the great savings effected in labor. This being so the farmer should ask himself whether the money

Dairying is most profitable



PRICES for dairy products have held firmly, while the cost of feed has been greatly reduced. Because of this there is relatively more profit than ever in dairying, and many farmers are turning low-priced feed into high-priced butter-fat. An eminent dairy authority says that you can make corn worth $2 to $3 a bushel by feeding it to good cows.

Times like these prove the value of dairying. It is the backbone of the nation's agriculture—the most profitable, surest and safest of all branches of farming. Dairying is not suffering from overproduction, is not overcrowded or overdone.

And De Laval Cream Separators have done more than any other factor to place the dairy industry on such a firm and profitable basis. They save cream, time and money twice a day, every day in the year. They produce a steady cash income. They have made the market accessible, even though you live 500 miles from a creamery. They keep the skim-milk on the farm to produce another crop of calves, hogs and poultry. They are made so well that 20 to 30 years' service from a De Laval is not unusual. Over 2,500,000 are in use in all parts of the world.

You need a De Laval more than ever.
There is a De Laval agent near you—see him.

Sooner or later you will use a De Laval Cream Separator or Milker

The 1921 Guaranty Sale

"The Pacific Coast Holstein Classic"

50 Registered Holstein Tops. State Fair Grounds, Sacramento, Cal. Thursday, March 17, 1921

CONTRIBUTORS TO SALE:

AGEE BROS., Rivera, Calif.
ANITA BALDWIN, Santa Anita, Cal.
DEAN BEEMAN, Woodland, Calif.
BRIDGFORD HOLSTEIN CO., Patterson, Calif.
BURR FARM, Los Angeles, Calif.
CARNATION STOCK FARMS, Seattle, Wash.
ROBT. N. CLAPP, Nuevo, Calif.
R. L. HOLMES, Modesto, Calif.
FRED W. KIESEL, Sacramento, Calif.
A. W. MORRIS & SONS CORP., Woodland, Calif.
R. C. STURGEON, Tulare, Calif.
TOYON FARM ASSOCIATION, San Francisco, Calif.
ALEX WHALEY, Tulare, Calif.

Cattle for this sale were selected from herds owned by members of California Holstein-Friesian Association only, in California, by a Committee of four, working under the most stringent instructions to date.
No open heifers will be offered, the females including 8 fresh cows, 20 cows and heifers due to calve in March, April, and May; 6 due to calve in June and July; 9 due to calve in September and October.
Study the wonderful breeding and tremendous production represented, then add to it the services of the outstanding bulls to which these females are bred, then consider the excellent type of the offering, and the good health guarantees, and some appreciation will be had of the great worth of this offering as real foundation stock.

THE FEMALES INCLUDE:

KARLRAY ORMSBY ALCARTRA, the world's record junior 2 year old for 305 days combined milk and butter. Due to calve April 26 to the three times Grand Champion, King Segis Alcartra Prilly.
A 23 POUND JUNIOR 2 YEAR OLD half sister to the above heifer, due May 6 to King Segis Alcartra Prilly.
A DAUGHTER OF KING SEGIS ALCARTRA PRILLY, out of a 33 lb. granddaughter of King of the Pontiacs. Safe in calf to King Segis Alcartra Abbekerk, sire of the two heifers listed above.
A 2 YEAR OLD DAUGHTER OF KING SEGIS PONTIAC, bred to a 30 lb. son of King Segis Pontiac Jannek.
A 2 YEAR OLD DAUGHTER OF JOHANNA McKINLEY SEGIS, with 701.85 lbs. butter from 18,230 lbs. milk in 365 days as a junior 2 year old. Her dam a half sister to the dam of the world's record milk cow Pietertje Segis Prospect. Due to calve March 15 to Matador Segis Walker.
A GREAT YOUNG COW with 922.31 lbs. butter from 20,504.3 lbs. milk in one year, sired by a full brother to the 1146 lb. cow Johanna Piebe White. Her three nearest dams are all yearly record cows and she is due March 20 to Matador Segis Walker.
A GRANDDAUGHTER OF OLLIE JOHANNA SIR FAYNE, with 645.5 lbs. butter in 305 days as a senior 3 year old. Her dam with 515.95 lbs. butter in one year as a junior 2 year old, second dam a 26 lb. 4 year old with 667.4 lbs. butter in one year as a junior 2 year old.
A 20 POUND JUNIOR 3 YEAR OLD daughter of Forward Prince Segis, out of a 21 lb. 3 year old. A show heifer, due to calve June 14 to Carnation King Sylvia, the $106,000 son of May Echo Sylvia.
A 2 YEAR OLD DAUGHTER OF SEGIS PONTIAC ACME, out of a 22 lb. daughter of a 22 lb. cow. Due to calve May 22 to Matador Segis Walker.
A BEAUTIFUL 22.89 POUND 3 YEAR OLD DAUGHTER OF HOLLYWOOD LILITH PALMYRA, out of a 30 lb. dam that made 818.95 lbs. butter in a year as a junior 4 year old. Second dam a 35 lb. granddaughter of Pontiac Korndyke. Safe in calf to Matador Segis Walker.
A DAUGHTER OF CHIMACUM SPRING FARM KING PONTIAC, with 709.47 lbs. butter from 16,483 lbs. milk in 305 days as a junior 2 year old. Her dam a 31 lb. cow that was first prize 3 year old at National Dairy Show, and made 872.85 lbs. butter in 305 days as a 4 year old. Second dam a 30 lb. granddaughter of Colantha Johanna Lad with 1129.2 lbs. butter in one year. Due June 30 to Sir Pietertje Ormsby Mercedes 43d.
A DAUGHTER OF PAUL AAGGIE OAKHURST, the only sire with two 1100 lb. 3 year old daughters. She has 808.3 lbs. butter from 19,106.2 lbs. milk in 365 days as a junior 3 year old, and is out of the same dam as the heifer listed above. Due to calve June 13 to Sir Pietertje Ormsby Mercedes 43d.
A DAUGHTER OF SIR KORNDYKE PIETERTJE HARTOG, with 570.27 lbs. butter in 295 days as a junior 2 year old. Her dam a 30 lb. granddaughter of Colantha Johanna Lad with 1129.2 lbs. butter in one year. Due to calve March 22 to Sir Aaggie Mead.
A 2 YEAR OLD DAUGHTER OF CHIMACUM SPRING FARM KING PONTIAC, out of the same dam as the heifer above. Due to calve April 7 to Sir Pietertje Ormsby Canary.
A 20 POUND JUNIOR 2 YEAR OLD daughter of Johanna Bonheur Champion, out of a 25 lb. daughter of Homestead Fayne De Kol. Fresh and sells open.
A 1069 POUND YEARLY RECORD granddaughter of Colantha Johanna Lad, out of a 27.59 lb. granddaughter of Lilith Pauline De Kol's son. Due to calve April 6 to Sir Pietertje Ormsby Canary.
A 1036 POUND YEARLY RECORD daughter of Sir Ormsby Burke Segis, out of a 29.46 lb. daughter of Mutual Piebe Paul. Due March 20 to Sir Pietertje Ormsby Canary.
MONA FOBES, the great 30 pound show daughter of Mutual Fobes Longfield De Kol, with 863.95 lbs. butter in 305 days. Selling open.
A 2 YEAR OLD DAUGHTER OF SIR VEEMAN KORNDYKE PONTIAC, out of the 30 lb. cow Melba Hengerveld. Due to calve July 22 to Sir Aaggie De Kol Acme 2nd.
A 2 YEAR OLD DAUGHTER OF KING MOROCO ALCARTRA, out of an 18 lb. 3 year old granddaughter of Aralia De Kol, second dam a yearly record daughter of King Mead of Riverside, third dam a yearly record daughter of Juliana King of Riverside. Safe in calf to Sir Aaggie De Kol Acme 2nd.
A 24 POUND SHOW COW, safe in calf to Sir Aaggie De Kol Acme 2nd.
A 16 POUND JUNIOR 2 YEAR OLD DAUGHTER OF SEGIS PONTIAC ACME out of a dam that made over 30 lbs. butter in 7 days at 10 years of age, over 30 lbs. in 7 days at 11 years, and 788 lbs. butter from 18,859 lbs. milk in 365 days at 13 years of age. Safe in calf to King Korndyke Pontiac 20th, the $12,000 son of Miss Valley Mead De Kol Walker.
A DAUGHTER OF CHIMACUM SPRING FARM KING PONTIAC with 773.12 lbs. butter from 22,637.9 lbs. milk in 365 days as a junior 3 year old. Due to calve March 18 to King Korndyke Pontiac 20th.
A 2 YEAR OLD GRANDDAUGHTER of the 1039.6 lb. yearly record cow Iowana Witte, out of a dam now on yearly test. Due May 27 to King Korndyke Pontiac 20th.
A GREAT 27 POUND COW, safe in calf to King Korndyke Pontiac 20th.
THE SECOND PRIZE SENIOR YEARLING AT CALIFORNIA STATE FAIR, now fresh as a junior 2 year old and milking over 75 lbs. per day. Selling open.
A 2 YEAR OLD GRANDDAUGHTER OF KING VALDESSA, due to calve May 4 to King Pontiac Tola Ormsby, son of Y P Tola, the 36 lb. daughter of King of the Pontiacs now making 1000 lbs. butter this year.
A 2 YEAR OLD GRANDDAUGHTER OF KING VALDESSA, due to calve April 29 to King Pontiac Tola Ormsby.
A 25 POUND DAUGHTER OF COUNT SEGIS, fresh and selling open.
A 28.56 POUND COW, record made at 3 years 4 months, out of a 24 lb. 4 year old granddaughter of Colantha Johanna Lad. Safe in calf to King Pontiac Tola Ormsby.
A SPLENDID 29.21 POUND COW, by a grandson of King of the Pontiacs, out of a 21 lb. 3 year old. Fresh and selling open.
A 27.94 POUND 3 YEAR OLD, sired by a 30 lb. son of Dutchland Colantha Belle Boy. Fresh and selling open.
A 25 POUND 3 YEAR OLD DAUGHTER OF PRINCE GELSCHE WALKER KORNDYKE, out of an 18 lb. granddaughter of Pontiac Korndyke, second dam a 21 lb. 4 year old daughter of Pietertje Hengerveld Segis. Fresh and selling open.
AN OUTSTANDING 2 YEAR OLD, by a son of the Grand Champion bull Merci Lad Korndyke Burke. Her dam a 22 lb. junior 4 year old granddaughter of Tilly Alcartra, second dam a 27 lb. daughter of Johanna McKinley Segis, now making a big yearly record. Due to calve April 21 to the $41,000 bull King Korndyke Pontiac Acme.
A 28 POUND JUNIOR 4 YEAR OLD daughter of Merci Lad Korndyke Burke, out of a 26 lb. 2 year old granddaughter of King of the Pontiacs. Fresh and selling open.
A 19 POUND JUNIOR 3 YEAR OLD daughter of Merci Lad Korndyke Burke, out of a 22 lb. dam. Due to calve April 22 to Prince Walker Cornucopia, 36 lb. son of Prince Gelsche Walker.
A GREAT 2 YEAR OLD DAUGHTER OF PRINCE WALKER CORNUCOPIA, out of a 20 lb. 3 year old daughter of Merci Lad Korndyke Burke, second dam a granddaughter of King of the Pontiacs with 738.82 lbs. butter in 305 days as a junior 4 year old. Due to calve May 10 to the $41,000 bull King Korndyke Pontiac Acme.
THREE DAUGHTERS OF SEGIS PONTIAC ABBEKERK, 35 pound son of Segis Pontiac De Kol Burke. All bred to Sir Aaggie De Kol Acme 2nd.
A BEAUTIFUL 2 YEAR OLD DAUGHTER OF KING KORNDYKE PONTIAC 20TH, out of an 877 lb. yearly record daughter of Ignaro De Kol. Heavy with calf to Sir Aaggie De Kol Mead, son of Sir Aaggie De Kol Acme and Miss Valley Mead De Kol Walker.
A 2 YEAR OLD DAUGHTER OF KING MORCO ALCARTRA, out of a 17 lb. 2 year old daughter of Prince Gelsche Walker. Heavy with calf to Sir Aaggie De Kol Mead.

THE SEVEN BULLS:

CHIEF ABBEKERK PAUL 309002, born Apr. 24, 1920. Sire, King Abbekerk Johanna Segis, the $5000.00 son of Adirondac Wietske Dairy Maid. Dam, Fairmont Pauline De Kol 2nd, 39.12 lbs. butter from 711 lbs. milk in 7 days as a junior 4 year old, now on yearly test and will make well over 1100 lbs. butter. His dam and sire's dam average 40.07 lbs. butter and 770 lbs. milk in 7 days; 149.48 lbs. butter and 3195.4 lbs. milk in 30 days; and will average close to 1200 lbs. butter and over 28,000 lbs. milk in one year. He is a splendid individual.
CARNATION KING TILLIE DENVER 328160, born Nov. 9, 1920. Sire, Carnation King Sylvia, the $106,000 son of May Echo Sylvia. Dam, Jollie Tillie Denver, a 28.90 lb. granddaughter of Sir Korndyke Hengerveld De Kol. A splendid individual, and except the calf that goes to the Brentwood National, he is the highest record son of his sire at Carnation Stock Farms.
A SON OF SIR AAGGIE DE KOL MEAD, out of a dam that made 768.28 lbs. butter from 17,429 lbs. milk in one year as a four year old, second dam with 1025.97 lbs. butter from 24,660.4 lbs. milk in one year, third dam with 1008.2 lbs. butter from 20,740.3 lbs. milk in one year. Six of his seven nearest dams average 1043.26 lbs. butter in one year, and he is a show bull.
PRINCE WALKER CORNUCOPIA 15TH, 295749, born Nov. 26, 1919. Sire, Prince Walker Cornucopia, 36 lb. son of Prince Gelsche Walker. Dam, Sundrie Sunbeam Girl, with 1033.74 lbs. butter from 28,905.9 lbs. milk in one year after dropping triplets. This bull is one of the triplets, is a vigorous, growthy fellow, and a number of females are already safe in calf to him.
TOYON COUNT COLANTHA 309071, born Dec. 17, 1919. Sire, Dutchland Colantha Emperor, a 30 lb. son of Colantha Johanna Lad. Dam, a 30 lb. granddaughter of Colantha Johanna Lad with 1069.9 lbs. butter from 23,261.2 lbs. milk in one year, second dam a 27.59 lb. granddaughter of Lilith Pauline De Kol's Son. A high class individual.
KING PONTIAC TOLA ORMSBY, born May 17, 1919. Sire, It, son of Pontiac Clothilde De Kol 2nd, the first cow to make over 37 lbs. butter in 7 days and over 1200 lbs. in one year. Dam, K P Tola, 36.16 lbs. butter in 7 days, now on yearly test and almost certain to make over 1000 lbs. butter this year. She is by King of the Pontiacs and out of a granddaughter of the great foundation cow Prilly. A high class individual ready for service.
DEAN TULE SEGIS 320932, born Dec. 30, 1919. Sire, Dean Fayne Segis, a son of King Wachusett Valdessa and a 27 lb. daughter of King Fayne Segis. Dam, a 31.79 lb. daughter of a 28 lb. cow. His five nearest dams average over 30 lbs. butter in 7 days, and he is a show bull, standing second in a class of 19 at California State Fair 1920.

The Bulls To Which the 35 Bred Females in this Sale Are Safe in Calf.

KING KORNDYKE PONTIAC ACME, the $41,000.00 son of King Korndyke Pontiac 20th and Miss Aaggie Acme Burke.
KING KORNDYKE PONTIAC 20TH, the $12000.00 son of Miss Valley Mead De Kol Walker.
MATADOR SEGIS WALKER, sire of the new world's record junior 2 year old for yearly milk production; half brother to the world's record milk producer Segis Pietertje Prospect; sire of outstanding show ring winners.
CARNATION KING SYLVIA, the $106,000.00 son of May Echo Sylvia.
SIR PIETERTJE ORMSBY MERCEDES 43D, a great long distance son of Sir Pietertje Ormsby Mercedes.
SIR PIETERTJE ORMSBY CANARY, another great long distance son of Sir Pietertje Ormsby Mercedes.
SIR AAGGIE MEAD, son of Sir Aaggie De Kol Acme and the 1215 strictly official yearly record cow Aralia De Kol Mead.
SIR AAGGIE DE KOL ACME 2ND, son of Sir Aaggie De Kol Acme and the 1100 lb. yearly record cow Aralia De Kol 3d.
KING SEGIS ALCARTRA PRILLY, three times Grand Champion at California State Fair. His daughters now making wonderful records at first calving.
KING SEGIS ALCARTRA ABBEKERK, whose first daughters to freshen average over 22 lbs. butter in 7 days.
K. S. P. J. COUNT, a 30 lb. son of King Segis Pontiac Jannek, the great sire of show ring winners.
SIR AAGGIE DE KOL MEAD, son of Miss Valley Mead De Kol Walker and Sir Aaggie De Kol Acme.
PRINCE WALKER CORNUCOPIA, 36 pound son of Prince Gelsche Walker.

Auctioneer: Col. Ben A. Rhoades, Los Angeles. Bell and Davis in the Ring.

spent for the feeder is an expense or an investment.

The feeder requires filling only once in several days instead of once in several hours. Just stop and figure the number of hours of a man's time that would be saved by this method in 12 months and multiply it by the average pay a man gets, and see if the saving in one year wouldn't pay for the feeder. If the feeder will last five years, which one properly constructed will do, how many times will it pay for itself in that length of time, saying nothing of the convenience to the farmer of being able to get away for a day or two with his family on a picnic or to the state fair, knowing that his hogs are helping themselves to the feed in a better manner than if he were feeding them by hand?

The same thing is true with automatic hog watering devices. In fact, the probability is that the use of self feeders and self waterers is capable of reducing the labor of hog raising by as much as 50 per cent. These are only two items, but there are many others which represent the application of Yankee ingenuity to the farmer's problems. Automatic farm gates in place of the lumbering old contrivances save time and tugging; the little orchard tractors, made to take the place of one or two horses, are very efficient; they never get tired and they eat nothing when not at work. Many a farmer who makes his head save not only his heels but his pocketbook, is counting on producing as much or more salable produce this year with his own labor and that of his sons, supplemented by modern labor saving devices, as he used to produce on the same acreage with the aid of two or three hired men.

STOCKMEN'S WEEK

(Continued from Page 324.)

especial emphasis on the fact that the men engaged in the production of the various breeds were all working toward one end and should work more in harmony to encourage the use of better sires and the need of closer cooperation by all concerned so that both producer and consumer might be brought closer together to their mutual advantage. He also urged a more careful system of feeding to cheapen costs of production, the more general use of pastures and the necessity of the breeder producing more of his feeds and using the hog as a medium of converting farm crops into cash.

J. P. Bennett of the Cultivator spoke on "Commercializing the Pure Bred Hog Business," laying especial stress on the need of each breeder putting his breeding operations on the strictly business basis, the necessity of cutting down costs of production, eliminating unnecessary overhead expense and the working out of an effective selling system to the farmers and pork producers. He also emphasized the production of as much of the feed as possible at home, either as forage or grain crops, thus cutting down the cash outlay that has caused many pork producers to suffer heavy losses during the two previous years; also the need of improving the standards of excellence, thus increasing the efficiency of the pure bred over the scrub and the necessity of having some idea of production costs so this efficiency in production can be demonstrated.

Dr. C. M. Haring gave a short talk on swine feeding experiments. He spoke of the need of adequate equipment at the university farm to carry on this work. Dr. F. M. Hayes of the veterinary department told those present of the results of the research work and experiments for the control of contagious abortion in swine. Much information of interest to the swine breeders will soon be available both as to the cause and control of this disease that caused such heavy losses throughout the state a year ago.

Prof. E. H. Hughes gave a short talk on the feeding of hogs and the use of various feeds and pasture crops.

A business meeting was then held and the following officers elected for the ensuing year: J. I. Thompson, Davis, president; C. B. Cunningham, Mills, and R. M. Filcher, Corcoran, vice-presidents; E. H. Hughes, Davis, secretary-treasurer; V. F. Dolcini, Davis, H. M. Berglund, Dixon, J. Francis O'Connor, Santa Rosa, F. B. Anderson, Sacramento, M. Bassett, Hanford, Francis T. Underhill, Santa Barbara, were elected directors.

California Shorthorns Average $268

The fifth annual sale held under the auspices of the California Shorthorn Breeders Association at the university farm, Davis, Tuesday, February 22, resulted in a general average of $268 on the 78 head sold. While the values established were regarded as extremely conservative, the consignors recognized before the sale that too many entries had been accepted, especially of the younger bulls. The buyers, knowing the large number to be sold, felt sure of their position and refused to manifest undue interest in the offering and bided their time to pick their bargains. A disappointing feature of the sale was the lack of appreciation shown for the more fashionably bred sorts over the less popular kind. The top ends of both bull and female divisions was up to the usual high standard of the association sales and were entitled to more liberal support from the buyers. Anyway the sale is figured it was a buyers rather than a sellers event, but the latter, even though they may feel that some of their entries failed to bring all that they should, can gather some consolation in knowing that they furnished a class of cattle to many new breeders that will serve to bring future patronage to their herds.

The sale, which was managed by D. J. Stollery, secretary of the state association, was opened by an address by B. O. Cowan, formerly assistant secretary of the American Shorthorn Breeders Association, and Ried Carpenter, noted Shorthorn breeder of Ohio.

The top of the sale was made with the senior yearling heifer, Violet Opal 4th, consigned by W. M. Carruthers of Liveoak and purchased by W. S. Short of Arthur, Nevada, for $800. The top bull came from the consignment of the Blackhawk Ranch, Diablo, Blackhawk Archer, and was purchased by H. C. Muddux & Son, Sacramento, for $690.

Clyde N. Moore of San Francisco was the auctioneer and he was assisted in the ring by Cols. John A. Davis of Manteca and Tim Anspach of Sacramento.

A representative list of sales follows:

Consigned by W. M. Carruthers, Live Oak

1, Riverside Grace 3rd, Feb., 1919, W. J. Fulgham & Son, Visalia, $550.
12, Riverside Grace 4th, May, 1920, W. J. Fulgham & Son, $220.
14, Violet Opal 2nd, Dec., 1918, W. J. Fulgham & Son, $725.
16, Live Oak Grace, Sept., 1919, H. C. Muddux & Son, Sacramento, $285.

HE'LL IMPROVE YOUR HERD

In the ad appearing on page 291 of last week's issue of the California Cultivator, carrying the above head, there was error in arrangement of phrases which made an entirely erroneous statement. The ad should have read "Andon Prince Cornucopia, No. 321092, 20 months old, light colored, a sure and quick breeder." The next paragraph in the ad should have begun "Sire: Segis Pontiac De Kol Burke Gerben, a blue ribbon winner whose two nearest dams average 31 lbs. butter, etc." However, our attention has been called to the rearrangement of the phrases which made it appear that the sire of Andon Prince Cornucopia was only 20 months old. Mrs. Donders has a magnificent young animal in Andon Prince Cornucopia, as is shown in the two paragraphs giving records of sire and dam in the ad in this week's issue.

H. H. Sisson of Sunnybrook Farm, Willits, writes: "Our heifer, Princess Boweda Alcartra, granddaugter of the famous Boweda, has completed her 30 day strictly official test and made 83.82 pounds butter and 2102.7 pounds milk. This heifer is a junior two year old and made 21.029 pounds butter and 538.5 pounds milk in seven days. This milk record both for seven days and 30 days places her among the leading two year olds of the state."

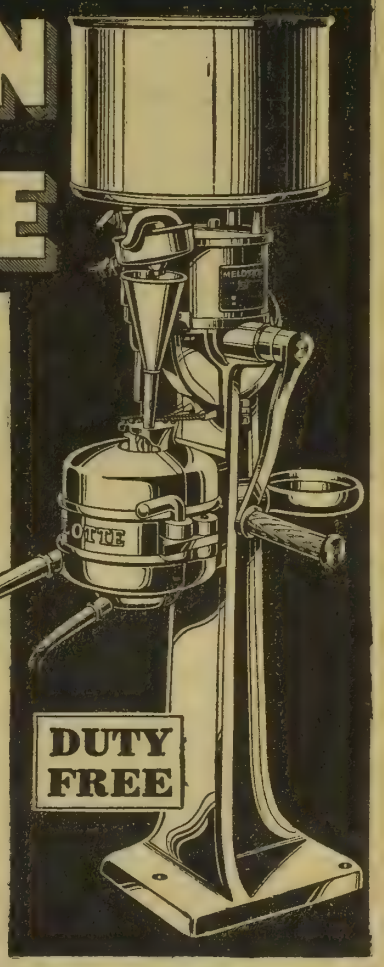
BELGIAN IMPORTED MELOTTE



No Money Down

Jules Melotte—*"The Edison of Europe"*—is placing his **Great Belgian Melotte Cream Separator** on the American market on a wonderful—**no money down—30 days' free trial—easy payment offer.**

You, who have wanted the world's greatest separator, write for catalog right away. Find out why 500,000 Melotte Separators are in use today. Before buying any separator find out how the Melotte has won 264 Grand and International Prizes and every important European contest. Mail the coupon now for our great offer.

$7.50 = After 30 Days' Free Trial!

You are not to send a cent until you have used this Great Belgian Melotte for 30 days on your own farm and thoroughly made up your mind that it is the separator you want to buy.

Easy Payments

After 30 days, when you are completely satisfied that the Belgian Imported Melotte is, by far, the best cream separator to be found any place in the world, then send only the small sum of $7.50. Settle the balance in small monthly payments. Mail coupon NOW—today.

Send this Coupon!

Fill out and mail the coupon for new Melotte catalog containing full description of this wonderful cream separator and the story of M. Jules Melotte, its inventor. Don't buy *any* separator until you have found out all you can about the Melotte and details of our 15-year guarantee. Sending coupon below does not place you under any obligation whatsoever. It brings you new Melotte catalog and full description and details of our Great Special Offer. Don't do another thing today until you have mailed coupon.

The Melotte Separator, *H. B. Babson, U. S. Mgr.*
Dept. 3023, 2843 West 19th Street, Chicago, Ill.

Self Balancing Bowl

Can't vibrate or get out of balance. Bowl chamber is porcelain lined. Easy to clean as a china plate. Can't rust. One half less tinware to clean. Bowl spins 25 minutes after you stop cranking unless you apply brake. No other separator needs a brake. Send for catalog showing details of the Melotte self-balancing bowl; also many other features.

The Melotte Separator, H. B. BABSON, U. S. Manager
Dept. 3023, 2843 W. 19th St., Chicago

Without cost to me or obligation in any way, please send me the Melotte Catalog which tells the full story of this wonderful separator and M. Jules Melotte, its inventor.

O. U. R. Hampshire Sale

Everyone recognizes the Underhill Ranch at Santa Barbara as a leader in Hampshire circles in this state and everyone turned out to the big sale on the 8th.

Mr. Underhill had chosen a lot of fine stock and Supt. Dinsmore had them in fine shape. The sows were nearly all heavy with pig and sold rapidly and well. The top was the fine big sow Tipton Missie, one of the foundation sows of the herd, who sold to Harry Gantz of Montecito for $425. Mr. Gantz has watched this herd for a long time and knew the individuals almost as well as the owner did. He also bought Scottish Girl, a daughter of Hawkeye Lad, for $375, and a number of the others.

The Doheney Land Company bought Lady May, another daughter of Hawkeye Lad, for $325.

Mr. Underhill has used these sows to breed with his chosen boars and develop his own foundation animals. He is just now ready to go ahead and develop the Hampshire along lines he desires. He is a close student of the blood lines of the breed and has done some excellent work in developing it.

A number of the animals were sold for shipment to Oregon and the Eastern states.

Tipton Missie, Harry Gantz, $425.
Scottish Girl 19th, Harry Gantz, $375.
O. U. R. Cresta Tipton, W. B. Lindsay, $125.

Beatrice 3rd, Roy Rickard, $65.

THE CALIFORNIA POLAND CHINA BREEDERS SALE

The sale of bred sows and gilts held by the California Poland China Breeders' Association at the University Farm, Davis, Friday, February 25, was very successful in every way. Not only was the average of $97 per head very gratifying, but the fact that with the exception of a very few head, the entire offering went into the hands of new men either to start new herds or to grade up commercial herds. The offering was a high class one and demonstrates the fact that the public is ready to buy high class stock when given the opportunity. Much credit is due A. J. Elliott, Tulare, for the high class maner in which the sale was conducted as well as the hard work he accomplished to make the sale a success.

The top of the sale was Tulare's Best, consigned from the Elliott herd and purchased at $250 by Stralock Farm, Davis. The next top was an outstanding fall gilt from the Eastman Ranch herd, San Fernando, purchased at $165 by L. E. De Forest, Susanville. H. V. Traynham, Davis; George Vogelsang and William La Grange were all heavy buyers.

Col. George Bell on the block, assisted by John Davis, Manteca, and Fred Gatewood, Fresno, was in good form. Following are part of the sales:

1, W. F. La Grange, Inverness, $75.
3, H. V. Traynham, Davis, $75.
4, Stralock Farm, Davis, $250.
5, T. S. Glide, Davis, $110.
6, B. G. McClelland, Litchfield, $80.
7, H. V. Traynham, $90.
8, J. E. Bronson, Doyle, $70.
10, W. F. La Grange, $110.
15, Geo. Vogelsang, Chico, $150.
16, J. S. Roberts, Sheridan, $155.
17, Bassett Bros., Hanford, $75.
18, L. E. DeForest, Susanville, $165.
20, Bassett Bros, $75.

THE WESTERN BERKSHIRE CONGRESS SALE

The Western Berkshire Congress annual sale of bred sows and gilts at the University Farm, Davis, Thursday, February 24, was not so successful as we had hoped it would be. The offering was worthy of better prices than the $60 average received. The sale was conducted in a high class manner, but for some reason the large crowd present did not respond as they should have done. The entire offering sold at very uniform prices, prices any farmer could pay with the assurance of making a good profit out of the cheap feed available at the present time. The top of the sale was Rookwood Lady Double, consigned by J. Francis O'Connor, Santa Rosa, purchased by Italian Vineyard Co., Guasti, at $125. The next top was Champion Star Lady, consigned by H. C. Muddux & Son, Sacramento, purchased by D. J. Bastanchury of La Habra at $100. The Italian Vineyard Co., Guasti; Wm. Carruthers, Live Oak; Sierra Vista Vineyard Co., Minturn, and W. F. La Grange, Inverness, were all heavy buyers of the better lots.

Col. George Bell, Tulare, sold the offering in his usual satisfactory manner.

1, Italian Vineyard Co., Guasti, $55.
5, H. C. Muddox & Son, Sacramento, $75.
7, Fred Hall, Perris, $50.
9, Wm. Carruthers, Live Oak, $70.
11, C. M. Talmadge, Salem, Ore., $55.
12, Sierra Vista Vineyard Co., Minturn, $45.
13, D. J. Bastanchury, La Habra, $100.
14, Italian Vineyard Co., $80.
15, Italian Vineyard Co., $60.
16, Italian Vineyard Co., $125.
17, R. W. White, Woodland, $50.
18, W. F. La Grange, Inverness, $45.
23, Miller & Lux, $65.
24, Sierra Vista Vineyard Co., $55.
25, Wm. Carruthers, Live Oak, $70.
26, Wm. Carruthers, $70.

WASHINGTON BERKSHIRES AVERAGE $150

The sale of Berkshires by D. C. Bunn, Prosser, Washington, was held February 19. The 50 head sold consisted of three herd boars, 18 bred sows and gils and 29 pigs of fall farrow. An average of $150 for mature animals and $35 for the pigs was secured. The top of the sale was one of the herd boars, Ames' Rival 158th, the sire of the grand champion boar at the last International, Chicago, going to Ralph King, Cleveland, Ohio, for $430. Royal Dominator and Bunty's Longfellow, the other two herd boars, sold for $325 each to Oregon agricultural college and Green, Goodwin and Bull, Yakima Valley, respectively. The sale was held under the management of Chas. M. Talmadge, Salem, Oregon.

NO SPECIAL FAVORS

"I'm bothered with rats," said Mrs. Casey, owner of the boarding house, as she talked over the back fence with her neighbor.

"Did yez buy any of thim rat biscuits for thim?" suggested Mrs. Kelly.

"Now, Mrs. Kelly, what kind av a house do you think I'm runnin'? Sure, if the bastes can't ate what the rest of us do, they kin go hungry."

Kodak on the Farm

On the farm Kodak serves a double purpose. Like the auto it is ready for business or for pleasure.

It is always ready for pictures in and about the home. The children, the family pets, the grange picnic, the thousand and one familiar scenes around the farm—all these contribute delightfully to the family Kodak album.

And there's a worth-while business use for the Kodak on every farm. It keeps a record of crop and orchard growths, the progress of building, the condition of the "line fence." It sells live stock.

And picture taking by the Kodak method is simpler and less expensive than you think. A catalogue of Kodaks and Brownies free by mail or at your dealer's.

EASTMAN KODAK COMPANY, Rochester, N. Y.

For the Prevention of

ANTHRAX

Of all livestock diseases, anthrax is one of the most fatal.
For the preventive and curative treatment of anthrax we offer

ANTHRAXOIDS
(Spore Vaccine)

For immunizing cattle, horses, sheep and mules.

Anthraxoids are Anthrax Spore Vaccine in pill form. Each Anthraxoid is a dose ready to be injected under the skin of the animal.

Antianthrax Serum

A serum to be used when animals show symptoms of anthrax.

Anthraxoids-Antianthrax Serum
(Simultaneous Treatment)

Double vaccination with serum and vaccine. Used when anthrax is established or suspected to be in a herd.

Write for free booklet on the Prevention of Anthrax.

SEEK TO NULLIFY OLEO AND IMITATION MILK LAWS

Sam H. Greene, secretary-manager of the California Dairy Council, calls to the attention of dairymen the efforts being made before the legislature to challenge existing regulatory dairy laws.

Greene says: "In the closing hours of the first session of the legislature in January, two bills were introduced in the senate that are a serious menace to the health and well being of the citizens of California.

"Senator Breed of Alameda County introduced S. B. No. 440, amending the present oleomargarine law. The intent of the bill is to relieve hotels, boarding houses and restaurants of advertising by signs and printed statements on bills of fare the fact that they serve oleomargarine. It would also nullify the regulation requiring retail dealers to display signs advertising the fact that they sell oleomargarine. Furthermore, it would permit the manufacture of colored oleomargarine for export.

"Senator Crowley of San Francisco County introduced S. B. No. 744. This bill is intended to amend the present imitation milk law by reducing the retailer's license fee from $5 to $1 per annum. It would also eliminate the provision in the license which now makes it unlawful for the holder of a license to manufacture, sell, or deal in imitation milk and similar substances if they resemble in appearance pure whole cow's milk, or the condensed and evaporated product made therefrom.

"If these bills should be enacted into law great harm would certainly ensue. The oleomargarine and milk laws of California are recognized throughout the United States as being models of this class of protective legislation.

"In the light of the knowledge that we have received in recent years, from the research and experimentation work of such scientists as McCollum, Funk, Hopkins, Osborne and Mendel, and the experience of Hoover, realization has been brought home to us all that it is imperatively necessary to protect the general public against imitations of these essential foods.

"The manipulation of animal fat or vegetable oils with milk from which the butterfat has been extracted yields products that are distinctly inferior in food value. By reason of the fact that their original cost is so very much lower than the cost of pure dairy products there exists a great incentive on the part of manufacturers of these products to exert every effort to remove every possible restriction upon their manufacture and sale. It is impossible to truthfully claim that any of these products are equal in food value to the pure dairy products which they are made to resemble.

"We have then, a clear cut situation in the case of these two bills: The present laws are reasonable and necessary for the protection of the development of children and the health and well being of the adult citizens of our state. Since no claim of superiority in food value can be substantiated, there can be but one reason for desiring to eliminate the present legal restrictions—the desire to extend the sale (for profit) of these inferior food products.

"If bill No. 440 should become a law butter would disappear from the tables of all the hotels, boarding houses and restaurants of the state, except in a few of the highest order.

"If bill No. 744 should become a law the present imitation milk law would be practically nullified."

INCORRIGIBLE OPTIMIST

The dear old thing, with her usual stock of questions, was visiting the circus. "Keeper," she said, "what do you consider to be the most remarkable animal in this collection?" "Well, ma'am," replied the keeper thoughtfully, "I should say that there laughing hyena gets the prize." "Indeed, my good man! What makes you think that?" "Well, he only has a sleep once a week, a meal once a month, and a drink once a year," said the keeper, moving on. "So what he has to laugh at sure beats me."

BUSY MAN'S MOTTO

If you have a half hour to spend don't spend it with some one who hasn't.—Columbia Record.

"I Can Well Afford to Feed It"

says Mr. A. L. McCulloch, of Alpaugh, Cal.

Mr. McCulloch is a far sighted feeder. He has noticed that Pure Cane Molasses has a tonic property and tones up the system of the stock. They are hungry all the time and clean up every stem in the mangers. A food that will have this effect, and can be fed as cheaply as Molasses can, is worth considering. It is not a question of how expensive–but how cheaply?

Find out about Pure Hawaiian Cane Molasses. All the information you need is in the booklet we have prepared for stockmen. Your copy is here–waiting for your letter. Send for it today.

FARM LAND FOR SALE

TEN PER CENT CASH
FOR SMALL FARMS

Ten, twenty and forty acre farms, $375 to $450 an acre, with water, on terms of ten per cent cash and easy annual installments. There's double profit here, from products and the rapid increase in values. These lands sell for $2,000 and up with matured orchards.

EARLIER and BETTER crops because of soil, water and climatic conditions. Three and a half tons of peaches from three year old trees. Seven and a half tons of apricots from five year trees. No land in California gives better results, at any price.

Carloads of trees now being planted by last year's buyers, all practical fruit growers.

INCOME INSURANCE

Close to a prosperous town, on the borders of a splendid lake. State highway and railroad pass through property. Seventy miles from Los Angeles. Many experts believe this will be the highest priced land in Southern California in ten years. The acreage in the district is limited.

Write for descriptive information prepared by the Elsinore Chamber of Commerce under supervision of Elsinore Farm Center, or come to our office. Best crops are Peaches, Apricots, Oranges, Grapefruit, Walnuts, Almonds, Olives, Grapes and Alfalfa.

J. B. Stearns Uede Jacobs

Legal Queries

Louis B. Stanton, attorney, 243 Wilcox Building, Los Angeles, will answer legal queries in this department.

Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Easements on Homestead

I own property upon which the original owners made declaration of homestead as the heads of family, which is duly recorded. After this declaration, deeds giving easements over the property were executed by the husband, in which, however, the wife did not join. The husband also executed a trust deed to a third party, in which the wife did not join. Under this trust deed, a third party granted to others the rights to develop water with riparian rights, which would seriously interfere with the use of the property. None of these rights have been exercised since the dates of the grants, now over 20 years old. Would the fact that the wife failed to join in the trust deed or in the easements invalidate them? Would the fact that the easements have not been exercised for over 20 years be ground for not permitting the parties to enter the property or to exercise such rights? What action should be taken to prevent such exercise, should exercise be attempted?—Subscriber, Los Angeles.

It is expressly provided by the code that the homestead of a married person cannot be conveyed or encumbered unless the instrument by which it is conveyed or encumbered is recorded and acknowledged by the concurrent act of both husband and wife. As the instruments mentioned would constitute either conveyances or encumbrances of the property, and the wife failed to join therein, they would undoubtedly be invalid as there has been no exercise of the rights thereunder. It would also doubtless be considered that the parties to whom the rights were granted had abandoned their interests, but as these instruments are of record, that would constitute a cloud upon the title of the property, which should be cleared by means of an action to quiet title brought against the various grantees.

Trespassing Hogs

A neighbor runs hogs and cattle. I run cattle in my fields and there is a good fence to turn cattle but it will not turn hogs. His hogs pasture largely upon my place. I have several times confined them in a corral and he has always come and got them. He pays no attention to my request to keep them off. Is it necessary that I put up a hog-tight fence? What can I do? —Subscriber, Dry Town.

As the land is all pasture land it would seem that under the general acts concerning estrays and trespassing animals there would be little relief, as these acts refer to lands which are planted to growing crops. It is possible, however, that a careful examination of the statutes pertaining to the individual county within which you are situated might give you relief, as these statutes vary. Otherwise, you are confined to merely taking the animals up and taking the lien provided in the estray act.

Private Telephone Line

Some time ago I gave permission to a neighbor to run a proper telephone line over my pasture upon the condition that he raise the line so that it would not interfere with the man rounding cattle in the field. He has failed to do this and the line is but a few feet off the ground and is very dangerous.—Subscriber, Dry Town.

Apparently this was a mere license made upon a condition which has not been fulfilled. The proper method to take would be to notify the delinquent party that unless the line was properly constructed within a certain time that at the expiration of that period you would take measures to cut the line off. Thereafter, if the condition was not performed, you could cut the line at the edge of your fields.

Damages From Runaway Team

A team ran away and collided with my fence, causing damage to the netting and posts. Can action be brought and damages collected against the owner of the team? — Subscriber, Ripon.

It would certainly seem that you would be entitled to recover the value of the property damaged. The action

(Continued on Page 339.)

Poultry Queries

Conducted by J. A. Koethen

Trapnest Door

Can you give design for easily constructed catch for setting and releasing door of trapnest?—Subscriber, Artesia.

I have mailed you Circular 142 of the California agricultural experiment station, which fully describes the California trapnest. Its door is hinged at the top, being swung inward and held at the bottom by a wire hook at just the right height so that when a hen enters the nest and walks under the door her back will raise it enough to release the hook and close the door quietly behind her. As the door swings shut against the outside door top (a three inch straight screw hook) the inside door top (a bent piece of No. 6 wire) drops down and locks it from the inside.

Swellhead

Some of my chickens have a large swelling in front of the eyes that comes to a head. They do not seem to have a cold, and the swelling appears on but one side. Others have eyes swollen and pale around the edges, with a watery discharge.—Subscriber, Rialto.

Both the swellings and the swollen watery eyes indicate roup. The simplest treatment is with potassium permanganate, but you cannot permanently get rid of the disease till you have gotten rid of the cause, which is almost always dampness in the roosting house, due sometimes to lack of ventilation, sometimes to rain coming through leaky roofs or under the foundation, sometimes to lack of drainage. Roosting houses should be open in front and should front south, so that the sun on winter days penetrates to the farthest corner. They should also, if possible, be in the highest part of the yard so that the damp night air may fall away from them instead of into them. It may be you have too many hens in one house, and they are so overheated at night that they chill when they come out in the morning. Possibly there are knotholes or cracks in the wall and a draft blows on the heads of the birds. Whatever the trouble, you will have to find and remedy it in order to stamp out roup. Before using the permanganate open the swellings under the eyes and cleanse with boric acid, hydrogen peroxide or some other antiseptic. Massage the nostril, rubbing upward toward the eyes, to loosen the mucous. Then drop a few permanganate crystals in a lard pail or quart measure of warmish water, just enough to give a pinkish tint. Dip the head of the bird in this solution and hold it there while you count ten, or longer if the bird can stand it. Repeat morning and night, using a fresh solution each time, till the disease disappears.

Indigestion

My hens have occasional diarrhoea and sometimes a whitish discharge from the vent. I feed clean grain, mostly milo maize, wet bran, soaked alfalfa, cooked potato peelings and some cooked fresh meat.—Mrs. C. H. B., Casa Grande.

An unbalanced ration and lack of green feed is causing indigestion. Your hens should have either one of the commercial mashes, which may be procured at any feed store, or a mash which you can mix yourself from a few simple ingredients. Equal parts bran and shorts with from 15 to 20 per cent beef scrap added, or 3 parts bran, 1 part shorts and 1 part corn meal with the same amount of beef scrap makes a good home made mash. If you care to mix a mash containing more variety try this, which is recommended in the last feed letter from the university farm (Feed Letter 12, Poultry Division, University Farm, Davis, Cal.): 50 pounds wheat bran, 50 pounds shorts, 50 pounds ground barley or oats, 20 pounds vegetable meals (soybean, cocoanut, linseed or cottonseed), 30 pounds meatscrap or fishscrap, 5 pounds finely granulated charcoal, 1 pound finely sifted dairy salt.

The dry mash should be before them all the time and the grain fed morning and night or only at night. It is better to feed two grains than one alone. You might use either wheat or barley with the milo. Then at noon give all the greens the hens will eat. Wet alfalfa does not take the place of succulent green feed. The cooked meat is all right for an occasional meal, and the potato peelings might be made into a moist mash with bran to be fed once a day as an appetizer.

Another Roup Cure

W. S. Kates of San Jose writes that he has found soda nuxine an excellent remedy for roup. This is a new remedy to me, and I am sure many readers will be interested, though I still believe that no cure can be permanent till the cause of the disease is removed.

Chicken Pox

We have a turkey gobbler that has scabs all over his head. Some of the hens are also getting them.—Subscriber, Orland.

Here is a remedy for chicken pox in turkeys which was given me only last week by a successful breeder: Rub all affected parts with carbolated vaseline. Mix and grind 2½ pounds each of nitrate of soda, copperas and Epsom salts. Add 2½ pounds powdered sulphur, 3¾ pounds dairy salt, 2 pounds carbonate of soda, ½ pound ground ginger, ½ pound carbonate of magnesia, 12½ pounds dry bone meal and 12½ pounds fine charcoal. Mix well and add 5 pounds of the mixture to 50 pounds mash for 100 turkeys. When this has been eaten mix 15 pounds of the mixture with the same quantity of mash and then a third time add from 6 to 10 pounds of the tonic to the 50 pounds of mash. The lady who gave me this prescription says she has found it a sure cure.

Bloody Shells

Why are my pullets laying bloody shelled eggs? I have been giving some special stimulants to induce laying. Do you think I have overstimulated them? I feed a warm wet mash of bran, ground milo maize, ground barley, meat scrap, cracked corn and tonic in the morning, and wheat, milo and occasionally rolled barley at night. Their allowance of greens is short.—Subscriber, Compton.

Yes, the blood on the eggs shows that the egg organs have been overstimulated. It is better to keep a dry mash before the hens constantly and to feed a moist mash only when they need a little coaxing. Please note reply to Casa Grande subscriber. The mashes suggested there should fit your need. Omit the tonic. Your hard grain ration is all right, but do not feed too much grain. A quart a day to from 12 to 15 hens is plenty. You can give a little in the morning and the rest an hour before sunset, or throw their breakfast in the litter the last thing at night so it will be ready as soon as they are off the roosts. Greens are very important. If you have nothing else, try mustard, wild radish, bur clover and other wild growth. Sprouted barley or oats once

Harvester Company Brands Story False

DURING the past month, reports have come to us that at farmers' meetings charges have been made, sometimes directly and sometimes indirectly, that this Company has adopted a policy of refusing to supply repair parts for old machines in order to compel the purchase of new ones. This statement is absolutely false. Such a policy has never been considered by this Company nor suggested to it.

Ordinarily we ignore such reports, because we have learned that any large company, no matter how fair and high principled, is subject at all times to unjust criticism. The facts are this Company has always recognized the importance of repair service and has used every effort to make IHC service the best. We believe we can truthfully say that the repair service furnished wherever this Company's goods are sold is equal if not superior to that furnished on any manufactured line.

We call attention to the fact that machinery "Fix-up Weeks," instead of being something new and originated by the farmers in 1921, as some seem to think, were really an outgrowth of the movement started by manufacturers and dealers' associations in connection with the Council of National Defense as a war conservation measure. Perhaps no other agency has done so much to promote "National Repair Weeks" as this Company.

The farmer needs machines which will be efficient and economical. If his old machines can be repaired so as to render efficient and economical service, he would be foolish to purchase new ones. Whether the farmer utilizes and repairs his old machines or buys new ones is a question for him to determine. But in making his decision, we give to every farmer who owns any IHC machines the assurance that a full stock of repair parts will always be provided by this Company.

Today, our repair stocks on the territory available for the farmers are 21 per cent greater than ever before at this time of the year. An average of a quarter million pounds of repairs are shipped from IHC factories for every working day in the year. Thirty million dollars' worth of repair parts are now ready, as insurance for the farmer when he needs this service.

In every International Harvester Works manufacturing orders call for repair parts first and even when furnishing them has meant cutting down production of new machines for which we had orders, repairs have always had preference.

At every one of our 91 branch houses trained men are on duty to see that all orders are filled and shipped promptly. Thousands of dealers scattered everywhere with an assortment of repairs in stock are always ready and willing to render every assistance.

This service which this Company has rendered through the years to those who have purchased its machines has been a matter of great pride to the Company, and is the foundation of the cordial good-will existing between it and its customers.

We feel it is due the Company and those who have purchased its machines that we give the widest publicity to the fact that this service of repairs will be maintained and improved, and that any charges to the contrary are untrue.

SICK BABY CHICKS?

There's no excuse for losses beyond 10% to full maturity. Baby chicks are tender and susceptible to diseases—just as an infant—but it's natural for them to live and thrive. Give them the proper protection and care and they will grow into money for you.

I'll tell you how. I've helped thousands of poultry raisers during the last twenty years and have thousands of letters thanking me. I'll show you how to raise at least 90% of your hatch, get more eggs, make money. Here's my proposition:

MONEY BACK IF NOT SATISFIED

My Germozone, on the market a quarter of a century and used continually by many during all that time, is both preventive and curative—a remedy for roup, colds, canker, diarrhoea, swelled head, chicken pox, bowel trouble and all such ailments of poultry and pet stock. With this I give ABSOLUTELY FREE my books, "Care of Baby Chicks" and "Lee's Poultry Book." These books tell how to avoid the pitfalls and mistakes that cause so many to fail in poultry work. Tells how to house and feed and care for chickens, how to detect diseases, how to prevent sickness and how to overcome ailments already present. Every bit of advice is based on common sense and actual experience.

Get a package of Germozone tablets—25c and 75c sizes—from your dealer or direct from me. Use Germozone and follow my directions for 60 days. If you are not entirely satisfied return the empty carton, with this advertisement, to the place where you purchased the Germozone and your money will be returned to you immediately.

I make this remarkable offer because I know you will get far better results. Start today. Thousands of others are having big success with my remedy and my system. You can make your poultry pay.

At your drug or seed dealer, or direct, C. O. D. if desired, from

a day is a great help in inducing laying. Sprout the grain four or five days and feed when the sprouts are about one-eighth inch long.

For Growing Chicks

I have some chicks coming off in a couple of weeks. How shall I feed them for early development?—Subscriber, Compton.

Start them on rolled oats, with grit, water and, if you have it, sour milk before them. The second day put chick feed before them and the third add bran to the chick feed. By the end of a week they should have a chick mash before them part of the day, and after three or four days it may be left before them constantly. Good chick mashes may be had at all feed stores but it is a good plan to add rolled oats to the mash for a while. The oats make frame. By the end of a week you can begin to add whole wheat and cracked corn or gyp corn or milo to the chick feed, just a little at first. The sooner you can get the chicks off the fine chick grain and onto whole grain the better. After three or four weeks drop the chick mash and keep a growing mash before them. Give all green feed and all exercise possible. If you can give free range so much the better. Exercise is just as important in producing early maturity as is feed. After 2½ to 3 months you can change from the growing mash to the laying mash, but do not force the pullets. They must make frame and muscle before they can become steady producers.

Squab Book

Where can I get reliable directions for raising and care of squabs?—Subscriber, Escondido.

The National Standard Squab Book, by Elmer C. Rice, P. O. Box 175, Boston, Massachusetts, contains complete directions for squab culture.

POULTRY PRODUCERS WANT MEMBERS

The Poultry Producers of Southern California are out for members and they are going to get them. There are now 540 shippers, members of the association. This is the largest number since the formation of the association, but it is not enough, for there are sufficient eggs outside, used by independent dealers in complicating market conditions so that association eggs cannot be sold to best advantage. Furthermore, a campaign is being made with members for a cleaner, higher grade product. In a circular letter to members, Cornele Ross, chairman of the executive committee, writes:

"We would suggest to all our members that they take immediate steps to clean up their houses and nests so that the number of soiled eggs may be reduced to a minimum. This would materially increase our returns, for dirty eggs are always a source of added expense and annoyance, especially when some of them cannot be promptly disposed of, but must be placed in storage. Greater care should be taken in grading and packing if we are to handle the increased receipts with a minimum of help and expense at the receiving station."

HEMET POULTRY CLUB

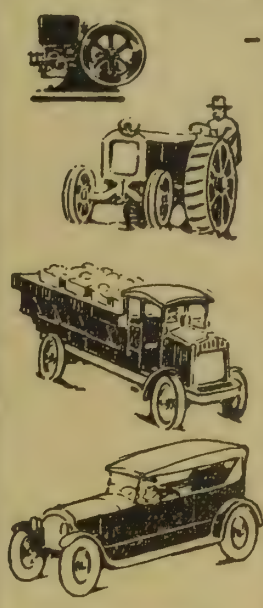
Assistant Farm Adviser John F. Osborn is making arrangements for the formation of a poultry club for the boys and girls of Hemet Valley, through the poultry association.

The members of the junior club will organize with the usual officers and they will hold meetings once a month. All school boys and girls who can do the required work are eligible for membership. Meetings will be held once a month and once a month the club will be visited by W. R. Rallston, leader of club work for Southern California.

POULTRY EXPERT WANTED

A movement has been started among the Poultry Producers of Southern California to get a poultry extension expert for Southern California and arrange to install an egg laying contest in Southern California under the direction and auspices of the farm bureau.

Worn and leaky piston rings waste motor power and fuel



—install rings that won't leak!

Leaky piston rings are too costly, no matter how little you pay for them. If they are not designed right and if they aren't carefully manufactured from the finest metal—they will let enough oil and gas waste past them to cause many oil and carbon troubles, a great loss of engine power, and a tremendous waste of gasoline and lubricating oil.

What little extra money the best rings cost you is made up many times over in economical and satisfactory gas engine operation.

McQuay-Norris Equipment—the Superoyl Ring to keep oil out of the combustion chamber—and the genuine Leak-Proof Ring to prevent the leakage of fuel—will increase your gas engine power—save gas and oil—and decrease carbon troubles. These rings represent 10 years of successful experience in piston ring manufacture. Your dealer can supply you in any size or over-size for any make or model of engine.

Always install the combination

PISTON RINGS

Wonderful New Hay Crop
SUDAN GRASS

First Introduced into the U. S. in 1909 from the Sudan in Africa. Tests by the department of agriculture have proved it to be of the greatest value in the Southern and Western states, where rainfall is deficient.

Culture—Sudan Grass is strictly an annual. It may be drilled or broadcasted. If drilled 8 to 12 lbs. per acre is ample; for broadcasting 15 to 25 lbs. should be used. It grows 8 to 10 feet high and yields from 3 to 8 tons per acre. You are sure of two cuttings, and if irrigated three or four cuttings.

Sudan Grass for Pasture—During the months of August, September and October all other grasses are dry, then is the time Sudan is most valuable for fall pasture, and by having it fenced in small fields it will yield food for six times as much stock as any other forage will without irrigation. For milk cows and hogs, there is no better and more abundant pasture than Sudan Grass. It will solve the hay proposition as nothing else can or will do in this climate. A good silage and balanced ration. This seed was grown on our own farm, and is free from Johnson Grass.

Milo: Cal. Red, 1.95@2.00; Eastern 1.60@1.70.
Kafir: Eastern, 1.60@1.70.

HAY

Alfalfa Growers of California report under date of March 1:

Receipts during week were 650 tons.

No. 1 Dairy Alfalfa	21.00
Standard	19.00

Under date of February 26, A. W. Scott Co. says:

Arrivals past week 650 tons. The hay trade continues to be extremely slow and the markets all over the state have been weak. Although offerings have been a little more free through the interior districts demand has been light and there has been apparently no particular need for hay in amounts that would influence or strengthen the market in any degree. While there is a feeling that hay has approached its normal level and will probably not decline much more there is an uncertainty as to future values that still prevents active trading.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, fancy	20.00@21.00
Wheat Hay, light 5-wire bales	17.00@20.00
Tame Oat Hay, fair to choice	17.00@19.00
Wild Oat Hay	12.00@15.00
Barley Hay	12.00@15.00
Alfalfa Hay	17.00@20.00
Stock Hay	10.00@14.00

Citrus Markets

Los Angeles, March 2, 1921.

The blizzard which swept over the East restricted sales for a time but moderating weather is now coming and fruit is moving with increasing demand. Quotations f. o. b. California are running around $3.00 with larger sizes commanding premium, for instance, 136's sell readily at $3.75. There are a great number, however, of extremely small sizes which are being cut seriously. The warm weather of last Friday and Saturday was not helpful to the keeping qquality of the fruit already fully ripened. The temperature in some of the orchard sections reached almost 90 degrees. Eastern auctions are showing good average prices.

Lemons are at practically the same quotations as last week with rather more foreigns on hand and available for sale within the next 30 days.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 8,238 cars; lemons, 1,982; total, 10,220. To same date last season: Oranges, 8,271; lemons, 1,938; total, 10,209. From Central California to date, this season: Oranges, 4,035; lemons, 95; total 4,134. To same date last season: Oranges 3,456; lemons, 233; total, 3,689. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total, 283.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Diseased Ovaries

I have a mare that is vicious when she comes in heat and kicks so I cannot work her at all. She seems to stay in heat most of the winter. At other times she is a very good horse. Is there anything I can give or inject that will keep her quiet? She has been bred but without success. Could she be spayed and if so what would be the cost?—Subscriber, Summit Valley.

Yes, she can be spayed and that is about the only treatment that will be effectual. She probably has one or both ovaries diseased, and when they are removed she will be as kind and good as ever. The operation is not extremely difficult but is seldom performed because there are few occasions for it. Only a few veterinarians are familiar with the operation so you might have some difficulty finding one to do it. The risk is not very great but there are some chances that you might lose her. The price depends entirely on the man. The operation should be performed through the vagina, then there will be the least danger of infection and no scars to show. Both ovaries should be removed whether both appear diseased or not. Should you not be able to have her spayed you might help her some by giving one-fourth ounce of bromide of potash in the drinking water once a day for a week. If this helps for a time then when the symptoms return repeat the bromide.

Horse Rubbing Tail

I have an eight year old horse that habitually backs up against a post and rubs the base of her tail against it so that much of the hair is kept worn off. Can you suggest probable cause and cure?—Subscriber, Thermal.

This may be due to pin worms or a mite in the skin. For pin worms inject tobacco water. Use a paper of scrap tobacco and boil it for 20 minutes in three gallons of water. Strain, and when cooled to blood temperature, inject it all at one time into the rectum. Repeat this in one week. For mites in the skin: Scrub the tail with tobacco water made as above. Do this once a day for a week.

Sick Hogs

What is wrong with our hogs? One by one they become sick and droop. They stand in a humped position or lie for hours, but not always asleep. They eat barley and drink water but do not care much for milk and mash. The worst one has difficulty in breathing and is swollen about the head, the nostrils being nearly closed. They were sick before we noticed it because they are thinner than the rest now, etc. What would you advise?—Subscriber, Greenfield.

Better consult a veterinarian as it may be hog cholera and in that case will go through the herd. One can not tell without seeing them. The most you can do without help is to separate the sick ones from the rest and clean up the place. Then sprinkle plenty of dry lime about, making the place white with the lime.

Period of Gestation of the Cow

I have a cow that was bred June 20, 1920. When could one expect the calf?—Subscriber, Petaluma.

The period of gestation of the cow is 285 to 290 days so in your case you may expect the cow to come fresh soon after April 1.

Sweeny

I have a horse that is sweenied in both shoulders. Is there a cure for it?—Subscriber, Mt. View.

Sweeny, or atrophy of the muscles of the shoulder, is due to a strain. The sooner it is treated the better. External irritants such as liniment or blisters are of little account. An old fashioned remedy is to run a tape under the skin the whole length of the muscle and leave it there until the muscle fills up to its normal size. The tape should be moved up and down every day and some oxide of zinc ointment rubbed on the tape. This remedy is not used much now. A better remedy is to inject the muscle with an hypodermic syringe, using equal parts of turpentine and alcohol. A few drops of medicine should be injected deep into the muscle in several places. This may have to be repeated once in about two weeks but one treatment usually is sufficient. Only a veterinarian should do this as others do not know how to clean the parts or use the syringe.

ARIZONA POULTRYMEN GET BUSY

Maricopa County, Arizona, has an enthusiastic and active bunch of poultrymen cooperating in an association which holds monthly meetings at Phoenix: W. J. Fetterly, president; Mrs. O. F. Temple, vice-president; Arthur G. Freeland, secretary-treasurer.

A committee has been conferring with the state university authorities at Tucson with the object of developing and enlarging the activities of the poultry department. Also egg laying contests and breeding experiments are believed desirable in order to try out all phases of poultry keeping under Arizona conditions of feeding, breeding, incubation and housing.

STORAGE SEASON HERE

The management af the Poultry Producers of Southern California is sending out this notice:

"Market conditions today make it necessary that packing for storage begin at once, and you will therefore discontinue washing or cleaning any eggs from this date.

"Pack all dirty eggs separately and mark plainly."

SWELLHEAD IN TURKEYS

Swellhead in turkeys is cured by opening and cleaning out the swellings under the eyes. Then nostrils, cleft of mouth and opened swellings are sprayed once a day with this mixture: 2 teaspoons castor oil, 1 teaspoon turpentine, 1 teaspoon coal oil. When young turkeys develop leg weakness painting the legs with iodine is found helpful.

The San Juan Union High School at Fairoaks, Sacramento County, has installed a butter fat testing machine.

TOP-DRESSING TALK
No. 8

Don't Waste Time and Labor!

Can you afford to be bothered by a wet lumpy fertilizer that must be crushed and screened before it can be applied?

There is a better fertilizer—one which will greatly reduce your labor of hauling and application.

Arcadian Sulphate of Ammonia has proved itself to be the most economical fertilizer on the market.

Its crop-producing power per pound nitrogen is equal to any other nitrogenous fertilizer.

It contains one-third more nitrogen than any other top-dressing material.

Ammonia 25¼% guaranteed.

It is all soluble and quickly available but is not readily leached from the soil.

Being a by-product of the American coke ovens it is the lowest priced ammoniate obtainable.

From Bag to Fertilizer Distributor

It is the fertilizer for your orchard, meadows, grain and for your truck crops.

Write Desk No. 5 for our free instructive booklet. Ask your local dealer to secure stock or order direct from the larger dealers.

National Grain Marketing Plan

THE farmers grain marketing committee of seventeen on February 16 voted unanimously to recommend to the farmers of America a grain marketing plan based essentially on the incorporation of a grain growers cooperative national sales agency. It is proposed to incorporate the national sales agency in the form of a non-stock, non-profit grain growers cooperative membership organization which will provide for the marketing of grain by virtue of contracts with farmers cooperative elevators or with local grain growers cooperative associations.

The growers of grain will take membership in the national sales agency. They will then effect an agreement with their local cooperative elevator or with their local grain growers association to deliver their grain on the basis of either a sales contract or a pooling contract. The local elevator or grain growers association will contract with the national sales agency to handle the grain.

It is contemplated that the national sales agency will control, through ownership of the voting stock, terminal agencies, warehouses, finance and export corporations and service departments.

Branch sales offices will be provided at important grain markets to handle the grain for each natural grain district. Wherever possible use will probably be made of all farmers cooperative machinery such as now exists. Effort will be made to open boards of trade to farmers cooperative agencies desiring to operate through seats on the exchanges.

In connection with the branch sales offices it will be necessary to provide government licensed warehouses, from which warehouse receipts will be issued and used as a basis of credit. These warehouse facilities will be acquired through lease, purchase, or erection.

A finance corporation is contemplated in order to provide adequate farmer controlled credit facilities whereby country elevators may properly finance the moving of the crop in an orderly fashion. The capital stock of the finance corporation will be subscribed when growers are asked to sign up their memberships in the national sales agency. The finance corporation is designed only to supplement existing financial machinery.

The farmer controlled export corporation will provide proper facilities for marketing exportable surplus of grain.

The service departments are designed to furnish accurate information on local, regional, national and world wide conditions which affect the grain trade. Transportation, legal, statistical and other departments will be included.

The membership subscriptions of the growers will provide the national sales agency with the initial working capital necessary for the acquisition of facilities for the immediate handling of grain on consignment. Later the running expenses will be secured by assessing a handling charge on the grain marketed through its offices.

When the plan is finished it will be submitted to a convention of the various farmers organizations interested in approving it as a means of improving the grain marketing of the nation. Meantime the farmer is afforded this opportunity to study the plan and to decide concerning its application to his own business of producing grain and of marketing it in the most efficient manner.

PROTECTION OF AMERICAN AGRICULTURE IS A NATIONAL DUTY

In presenting before the United States Senate the following resolution:

We request of Congress the enactment of a tariff law at once which will give to the farmers of America that measure of protection which may be necessary to equalize the difference between the cost of production of farm products in this country and the cost of competing nations where land is cheap and living conditions far below the standard which prevails in the United States,

Senator Arthur Capper made extended address from which we quote the following four paragraphs:

"Under the policy of protection we have become a mighty industrial nation. Why should protection, with these achievements to its credit, be withheld in the case of the greatest of all our economic activities? Why should agriculture be denied the aid already given to manufacturing and denied it at the time when it is most needed? This question is being asked today not only in the great Middle West, but on the Pacific Coast, on the farms of Pennsylvania, and even in the South.

"The past year, wheat, meats, hides, wool, butter, and many other farm products were dumped into this country through our adherence to free trade. The pages of our departmental reports are full of notes of instances of the ruin that free trade is bringing to American agriculture. It is of first American importance now that we correct these evils. For the sake of common justice and humanity this emergency tariff is all too little for the farmer to ask of his government.

"Practically every line of agricultural industry is today suffering acutely because of the absence of protection offered by this emergency tariff bill. The American farmer stands alone today of all the producers in the world. Other governments, notably those of Great Britain, France, Germany, Italy, and Japan, are helping their farmers, protecting and supporting them, but our farmers must go it alone in competition with all the world. They must sell their grain in markets dominated by the most powerful government commissions. Practically all of Europe today is buying its grain through government commissions, that are working together and that have all the resources, all the ingenuity, and all the brain power possible to hammer down the prices and buy cheaply.

"They say that if we give our farmers the protection which they deserve Europe can not pay its $10,000,000,000 of government debts. I shall say frankly that if the price which we have to pay for the payment of our foreign debts is the destruction of American agriculture, it were better that these debts were never paid."

USES FOR RIPE OLIVES

Even the olive growers have been surprised to find the number of ways in which the olive can be used. It has been found that ripe olives are a perfect substitute for mushrooms and that ripe olives make a delicious ingredient for stews and meat sauces; minced olives make delicious sandwiches while olives served with any kind of meat or salad add immensely to the dish.

California Ripe Olive Day Association has prepared a large number of recipes showing how ripe olives may be utilized. This pamphlet will be sent upon request. Address the association at its headquarters in Oroville.

Horticultural Commissioner Ryan of Los Angeles County reports to date fumigation in that county of 21,999 acres. Careful inspection and recording of various conditions have been made this year by officials connected with the horticultural department. The decreasing power of fumigation, or rather the increasing resistance of black scale to the fumes of hydrocyanic acid gas, is creating a serious situation for the citrus grower.

The ninth annual meeting of the Arizona farm bureau was held at the college of agriculture, Tucson, recently. One of the main topics discussed was the work of the American Farm Bureau Federation.

LEGAL QUERIES

(Continued from Page 333.)

would be based upon the negligence of the party driving the team.

Buying on Contract

A party owns two adjoining pieces of property, one of which he sells upon contract. After the vendee has paid nearly the total amount of his contract he discovers that there is a mortgae upon the property which he is purchasing. Does the existence of such a mortgae prevent the vendor from conveying clear title? If clear title canot be conveyed what is the vendee to do? Is it a criminal action to sell property under a contract like this and be unable to deliver clear title when the whole payment is made? The contract has been recorded and there is still another year's payment. The buyer has had possession during the whole period of time.—Subscriber, Arbuckle.

It is entirely lawful in this state to enter into a contract to sell property, title to which the vendor does not even possess. The vendee, if given possession of the property in which he continues during the period of the contract may be required to perform the covenants to be performed by him or his interest in the contract forfeited. If the vendor cannot deliver clear title (this means a title without any encumbrance such as mortgage, taxes, or other lien), the vendee may bring action against the vendor for the recovery of the moneys paid or, at his option, sufficient to discharge the encumbrance upon the property. The vendor is under no obligation, especially in such a state of facts as that here presented, to clear the mortgage on the property until the date of giving the deed. The reason that lies back of this rule is that the mortgage is recorded and the party purchasing property is presumed to look up the title of the property as it then stands. If the mortgage was not recorded it is worthless as far as such vendee is concerned.

Fig Trees Over Line

A row of fig trees has been found by recent survey to be about four feet from the property line. Large roots are found in my field 35 feet from the line. The limbs extend several feet over my line. To whom do the figs belong? Has the man upon whose land the trees stand the right to cut off the limbs extending over the line?—Subscriber, Kerman.

You have the right to cut the limbs and roots at the line. The figs growing upon the branches extending over your property belong to you. The trees, however, belong to the party upon whose property they stand. He would have no right to cut off any limbs projecting over your property, as such limbs would fall upon your property and thereby constitute a trespass. The right to cut these limbs is solely in you.

Water Rate

Has a city operating a water system the right to force a present owner to pay a water bill which was incurred by a former owner or the tenants of such owner? For that reason could the city attach the property or shut off the water of any present owner?—Subscriber, Santa Cruz.

An exactly similar case has been decided by the appellate court against the city of Los Angeles, wherein the city of Los Angeles had the following regulation: "All water rates shall be charged against the owner thereof, and if sums owing for water become delinquent, the water shall be shut off and not turned on for the same property until the delinquent bills have been paid in full. No change of ownership or occupation shall affect the regulation." The court then held that such regulation was unreasonable and contrary to statutory authority, in that it made one person liable for the debts of another and contravened the duty of the city to serve all inhabitants with water without discrimination. The city was thereupon ordered to furnish water to the new occupant.

Water Right

About eight years ago I purchased land, including a water right. The water is conveyed by means of a pipe line out of a reservoir upon lands in the hills. This pipe line crosses under ground through the orchards of several other persons before it comes to my land. At times it becomes clogged with roots and debris and it is necessary to go into the other orchards to dig down to the pipe and clear it. One of these other parties objects to my going upon his land. What are my rights in the matter?—Subscriber, Hollywood.

The owner of a dominant estate may do whatever is necessary to the enjoyment of the easement and to keep it in proper state of repair, provided it is done without imposing unnecessary inconvenience on the owner of the servient estate and the extent of the easement is not thereby enlarged. He has no right to make repairs in such manner as needlessly to increase the burden on the servient tenement, but the right to repair includes a right of entry upon the servient tenement for the purpose of making repairs whenever such repairs are necessary, and he may thereon do all that which is necessary to fully maintain the operation of his easement. Even though such right of entry is not expressly granted it is necessarily implied as an accessory to the grant of the easement.

Copyright

What are the necessary proceedings to take in order to obtain a copyright; also what is the cost?—Subscriber, Orosi.

The author, or employer of such author, where the work is made for hire, shall publish the work which he desires copyrighted, which shall contain therein a notice of copyright. This notice consists either of the word copyright or the abbreviation "copr.," accompanied by the name of the copyright proprietor. If the work to be published be a literary, musical or dramatic work, the notice shall also include the year in which the copyright was secured by publication. This notice, in case of a book or other publication, shall be placed upon the title page or page immediately following; if a musical work, either upon the title page or first page of music. Thereafter, he shall promptly deposit in the Copyright Office or in the mail addressed to the Register of Copyrights at Washington, D. C., two copies of the best edition published. All copies shall have been produced and mechanical work of printing performed within the limits of the United States. The postmaster to whom the copies are deposited, if requested, must give receipt therefor and mail to Washington without cost to the copyright claimant. In the case of a bank, the copies shall be accompanied by an affidavit made by the claimant or printer, stating therein that the copies have been printed in type set within the limits of the United States or from plates made from types set therein and shall also state the place where and the establishment in which the mechanical work has been performed. The copyrights secured by the act extend for 28 years from the date of the first publication. The register of copyrights shall receive as his fee for the registration of any work subject to copyright $1.00, which includes the certificate of registration under seal.

School Atendance

I am about to move on a ranch between which and the school for three months in winter time high water renders passage impossible. Is it compulsory that the children attend school? What provision is there for getting them across the river? The building of a bridge would be too expensive. Would the county be compelled to build it?—Subscriber, Los Angeles.

This matter should be taken up either with the county superintendent of schools or the trutees of the school district. The trustees are empowered with the written approval of the superintendent of schools to provide for the transportation of pupils to and from school whenever in their judgment such transportation is advisable and good reasons exist therefor, and to contract and pay for such transportation. The compulsory education law provides that in case children reside more than two miles from the school by the nearest traveled road they may be exempted from the school attendance upon written approval of the county superintendent of schools, notice of which approval is filed with the board of trustees of the school district.

The Guide to Better Farming Tools

No other person on earth knows better how wonderfully good Keen Kutter Tools really are, than the man on the farm who has for years used them himself.

This test of time brings out best their rugged, lasting quality, more convincingly than any other way.

They are the tools that serve best when the farm work is hardest, for Keen Kutter Tools are built so strong they even stand abuse.

This is true, not alone of Hoes, Rakes and Forks, but of Spades, Shovels and all other tools in the worthy Keen Kutter line.

Finely tempered steel blades, hand picked handles of enduring air dried ash and hickory, are not their only merits. In addition is the famous Keen Kutter zig zag tang, which so splendidly welds metal to handle that Keen Kutter handles can never become loose.

Be a business farmer—demand Keen Kutter Tools.

SIMMONS HARDWARE COMPANY

KEEN KUTTER

5 from 12 to

FROM five to twelve weeks—that's the time the profit-pendulum swings right or wrong, so far as growing chicks are concerned. That's the time they need momentum to help them "over the top" of their critical period.

What do these lively, hungry little fellows need most—from the time they are five weeks old until they are twelve weeks old? Do they need fat? Not so much! They need bone and muscle. They need a strong, sturdy framework on which to build your future profits. They need a good "boost" uphill.

And SUREGROW gives it to them! It contains the essential food units growing chicks must have if they are to mature into healthy, profitable chickens. It gives them the uphill lift they need—supplies the health and vigor they must have to become good layers or good breeders. It's surprising, too, how many chick troubles (such as indigestion, moping, slow growth) disappear once you get growing chicks going on this balanced ration.

This explains why more and more SUREGROW is being called into play by successful poultrymen. They have found that, just because growing chicks will eat anything, you must be doubly careful about the feed you *do* give them. Our booklet, "Makes Hens Happy," treats this feeding question in detail—gives you the advice of practical poultry experts. Your copy is waiting for you and it's free—simply cut out and mail the coupon now!

Purebred Bulls Pay

Pure Bred Bulls Increase Milk and Butter Fat Production

RESULTS WITH

5 Scrub Cows in 23 Lactation Periods
5 1st Cross Daughters in 21 Lactation Periods and
5 2nd Cross Granddaughters in 6 Lactation Periods

Offspring by PURE BRED BULLS of Three Breeds

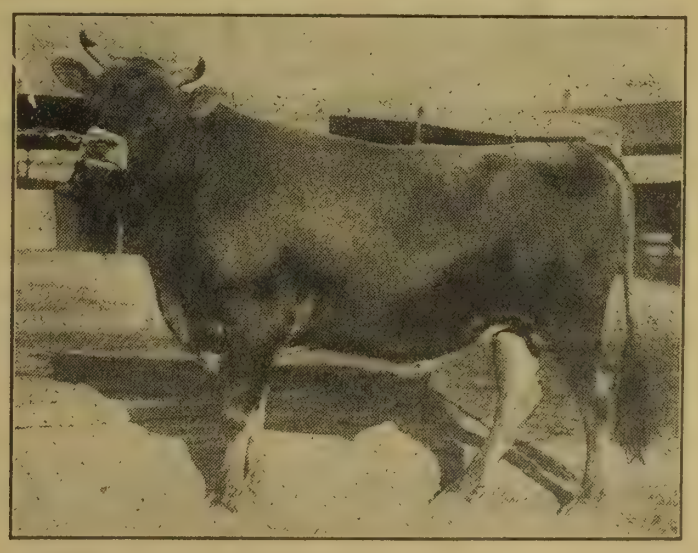
Production Records:

	Dams	Daughters	Granddaughters
Milk:	3660.2 lbs.	5998.7 lbs	8401.9 lbs
Fat:	171.57 lbs.	261.25 lbs.	358.17 lbs.

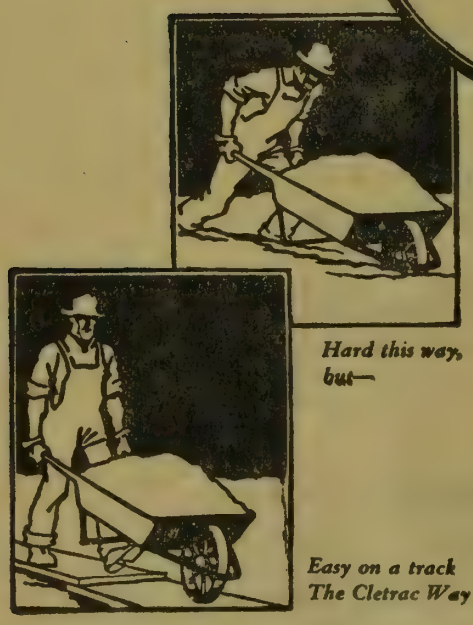
Increased Production due to Pure Bred Sires:

Daughters: Milk, 2338.5 lbs. or 64%
Fat, 89.68 lbs. or 52%

Granddaughters: Milk, 4741.7 lbs. or 129%
Fat, 186.6 lbs. or 109%



Cletrac
TANK-TYPE TRACTOR



Hard this way, but—

Easy on a track The Cletrac Way

Specifications

Horsepower: 12 at drawbar, 20 at belt pulley.
Length: 96 inches.
Width: 50 inches.
Height: 52 inches.
Weight: 3420 pounds.
Turning Circle: 12 feet.
Traction Surface: About 800 square inches.
Center to Center of Tracks: 38 inches.
Belt Pulley: Dia. 8 inches; face, 6 inches.

More Work and Shorter Hours —with the Cletrac

Guarantee yourself a bigger crop and more profit—give yourself more time for other work by plowing and discing this spring with a Cletrac. Rugged and powerful enough for any kind of work—steady and dependable—the Cletrac cuts the cost and time of doing it. Its sturdy motor and strong parts keep it on the job straight through the year—and 24 hours a day if you get behind.

Cletrac makes short shift of plowing, and gets right back on the field again with the discs. With its weight distributed over 800 square inches of track surface—only 4½ pounds per square inch, or half the pressure a man exerts—Cletrac treads lightly over mellow earth without slipping, digging in or wallowing. Cletrac always delivers the full rated drawbar pull of its heavy-duty motor—and never packs the soil.

Turns short—a turn of the wheel does it. On open land Cletrac swings quickly back to the furrow, without loss of time or power. And in the orchard its low build lets you weave in close to the tree trunks.

Cletrac is the *one* tractor adapted to *all* conditions—wet or dry, flat or hilly—that will pull your implements, harvest as well as cultivate, and run your belt machinery cheaply, too. Read the whole story in that interesting booklet, "Selecting Your Tractor." Write today—it's free.

Vol. LVI, No. 11 | Los Angeles, March 12, 1921 | One Dollar Yearly

A Community Livestock Association That Pays

By Elwood Mead

COMMUNITY cooperation for the buying, breeding and selling of livestock pays. This has been demonstrated by the members of the state land settlement colony at Durham now entering into the third year of its existence. What the Durham community has done, other communities can do.

The land settlement board decided early in its career that livestock raising should be encouraged in the colony for several reasons. The raising of poultry and hogs afforded one of the quickest means of producing an abundance of home grown food as well as an early cash crop. Dairying, once the proper shelter could be provided and good stock secured, afforded a certain and profitable income. Livestock on every allotment made possible the maintenance of soil fertility and gave additional outlets for some of the field crops and assured proper utilization of what would otherwise have been waste vegetable matter such as is grown on every farm. The board in encouraging the raising of livestock had in mind the settlers' welfare, but it was not altogether unselfish in its action, for quick returns and actual profits for the colonists meant that they could meet their installments with more certainty and be able therefore to pay back their obligation to the state.

Realizing that it would be difficult, if not impossible, for many of the settlers to procure good stock at reasonable prices, if having to buy independently, the board encouraged the formation of a community livestock breeders' association, the constitution and by-laws of which were copied after those of the most successful cooperative associations in Denmark. Every settler was required to become a member of the association.

Before the association was formed the board had written to the animal husbandmen in the leading agricultural colleges of the country asking them what they thought of the idea of the colonists raising but one breed each of dairy cattle, beef cattle, swine and sheep. The replies were all in favor of the plan, and after the formation of the association the members used the advice of the experts in reaching a decision regarding the breeds they should raise. After some discussion, Holsteins for dairying, Shorthorns for beef, Duroc-Jerseys for pork, Romney Marsh for mutton, and Rambouillets for wool, were chosen.

It was a big day in the history of the settlement when its members agreed to concentrate their efforts on a single breed. The reasons for adopting such a policy are, of course, obvious. Buyers of pure bred stock gravitate to those centers where the animals of the breed of their choice can be found in the greatest numbers. Having but one breed in a community makes it easier to maintain a cooperative marketing association. Likewise it makes possible cooperative buying, for by pooling their resources the members of an association can obtain better animals at more reasonable prices because of their wholesale purchasing power. Finally, but not least, having but one breed in a community makes possible the cooperative purchase and use of better sires and the higher prices that necessarily have to be paid for such animals can be met by the community purse.

The Durham Stock Breeders Association naturally had to function through an executive committee and upon this group of five men devolved the responsibility of purchasing the livestock desired by the colony.

The committee's first purchase was a herd of 27 cows and heifers from a tuberculin tested herd. These animals were distributed among the farmers at Durham and it is interesting to note that not a single one of the animals later showed any symptoms of disease. Soon other farmers were desiring cows in numbers large enough to at least supply family needs. The committee was not always in a position to supply animals when they were wanted immediately for they made it a rule to group their purchases and to bring in a herd at a time in order to reduce the expense of buying and transportation and thus to be able to offer the animals to the settlers at the lowest possible cost.

Many of the settlers, in their haste to get established in the dairy business, had bought cows from nearby farmers without having them tested for tuberculosis. Of the 42 animals purchased outside of the association, 35 reacted and their condemnation and forced sale meant serious loss to their owners. The association came to the rescue, however, agreeing to dispose of the diseased animals and to assume, on behalf of the whole community that composed its membership, one-half of the loss incurred. Only communities and states and nations as well, that are similarly organized, can hope to meet threatened dangers and calamities so promptly and effectively. By keeping out all diseased animals and by eliminating those that later prove to be reactors the association hopes to keep the colony free from tuberculosis. Cooperative effort in the enforcement of sanitary measures is much more democratic than having to rely on the police power of the state.

As was mentioned above, one of the first practical benefits of cooperation was the elimination of competitive buying among the members of the colony, the unnecessary running up of prices which would have ensued had each man been acting for himself alone. The committee closely watched the Holstein sales throughout the state and in some instances was able to get practically all of the animals in certain herds. The cows were shipped to Durham, where a home auction was held, each animal being sold to the highest bidder. As the colonists were eager to get the best animals, the bidding was often keen, and practically all of the animals brought more than the original purchase price. A refund was therefore made, and when a $500 cow sold for $625, for instance, the purchaser only had to pay 80 per cent of the price he bid. Through the efforts of the association the settlers

Gypsum

By R. R. Snowden

GYPSUM, or commercial sulphate of lime, contains 18.6 per cent sulphur and 23.25 per cent calcium in combination as follows: Calcium sulphate, 79.1 per cent; combined water (called water of hydration), 20.9 per cent; or,

Lime (calcium oxide, quick lime), 32.6 per cent; sulphur trioxide, 46.5 per cent; water of hydration, 20.9 per cent.

This is typical, or 100 per cent, gypsum. In gypsum of any lower grade the percentage of these components may be found in the following simple way:

Multiply the per cent of gypsum in the material by .186 for the percentage of sulphur; by .23¼ for the percentage of calcium; by .791 for the percentage of calcium sulphate; by .209 for the percentage of water of hydration; by .326 for the percentage of lime; by .465 for the percentage of sulphur trioxide.

High grade gypsum is of somewhat meager occurrence in California but exists in extensive deposits in Arizona and New Mexico.

The agricultural world is experiencing a vivid awakening to the need of sulphur in many, if not most, soils, which need has been too long overlooked.

Sulphur is just as necessary a component of the proteids, and hence just as indispensable to plant development as phosphorus. It is, therefore, a true plant food element, and its compounds —especially the sulphate—are just as surely fertilizers as potassium, phosphorus and nitrogen materials. It is as potent a limiting factor as any of the three necessary elements of a so-called complete fertilizer, since no crop can be grown without sulphur any more than it can be without potassium, phosphorus or nitrogen.

Some crops, such as the legumes and the mustard family, require more sulphur than others, yet all must have it. Gypsum is, therefore, a most important fertilizer for its sulphur content as well as for its lime and its beneficial effects in a number of other respects.

The mechanical effect of gypsum on certain soils is scarcely less important to agriculture than its physiological effects on plants, for besides the latter, gypsum has the valuable property of flocculating the clay particles of stiff clays and adobes, changing entirely the structure of these soils and rendering them more pervious to air and water and much more amenable to tillage. By neutralizing black alkali it is useful in reclaiming alkali land, often rendering it productive where nothing would grow before and raising the surface to the normal level of the adjacent lands.

It increases the availability of most of the plant foods in the soil, and especially potash. Besides this action in releasing potash for the use of plants, it supplies lime, which conserves the use of this expensive plant food, since plants well supplied with lime take up less potash than where lime is deficient, as shown by analysis of the ash of the leaves. Gypsum in several ways facilitates oxidation in the soil, and this Schreiner, Sullivan and Reid find to be closely allied to fertility.

The practical results from the use of gypsum are shown in the following observations:

A navel orange grove in Tulare County, the soil of which was found by analysis to be deficient in sulphur, was reported to have produced a 65 per cent crop after receiving two tons of gypsum per acre, while the neighboring groves produced only a 15 per cent crop.

In field experiments conducted by the Oregon agricultural experiment station, the yield of alfalfa was increased from 300 to 1000 per cent by applications of sulphates including gypsum in soils showing by analysis a deficiency of sulphur. During the last 10 years the writer has recognized this need of sulphur in many California soils.

That harm to vegetation may result from the free use of gypsum is negatived by the fact that to the writer's personal knowledge there was a fine orange grove and the wild vegetation of a Florida forest flourishing on a 60 per cent gypsum deposit in Citrus County, Florida, and the former continued to produce the finest of fruit up to the time of being killed by the freeze of 1895.

To sum up: All vegetation must have sulphur. Gypsum is the best form of sulphur to apply to the soil. No soil is injured, while certain ones are greatly benefited by applications of gypsum. No harm to vegetation can come from its use in any quantity. Gypsum indeed appears to be the good Samaritan of agriculture.

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

A study of the statements appearing on the cover page will, we hope, prove convincing as to the value of the pure bred, and by pure bred we are referring not only to cattle and horses and hogs and sheep, but, so far as possible to apply the principles of breeding to plant life, to all plants and crops which mean California's prosperity and advancement. In plant growth we prefer the term, bud or seed or stock selection, but the principle is all the same, for it is simply the selection of that which will serve man's purpose best. The one big lesson is, select. That can only be done satisfactorily by more general use of that portion of us above the shoulders.

* * *

There never was a time when the rights of the producer to cooperate in the marketing of his product were assailed so viciously as during the past few months. The attacks on the cooperative movement, in addition to freight rates at times prohibitive, are certainly giving to producers one discouraging time. The raisin growers, the prune growers, even the rice growers and the spinach canners are being put upon the rack. The rice growers have secured at least temporary relief from being declared "an illegal monopoly." Certain banks were enjoined from even lending money to the rice growers because of their use of the funds to carry themselves until they could secure a livable return from their last season's production. Besides, the effort was made to dissolve the rice growers association as "an illegal monopoly," but while this effort to destroy the cooperators has resulted in temporary defeat, the plaintiff, an exporting firm, has been given ten days to amend the complaint. One feature of the court's ruling was: "The mere elimination of the middleman through the actions of this association is not illegal," the court said, "because the growers may make an agreement with the ultimate consumer."

* * *

The King bill has been passed by the senate and the assembly and has been signed by Governor Stephens. It was passed without a vote to spare for the fight which was put up against it was the strongest which has been made in this state for many years. If the bill had not been passed we believe it would have been nothing short of disaster for California is advancing as never before and its needs are vastly greater. Notwithstanding that, we believe the remaining days of the state legislature will see very strong efforts made toward material reduction in the demands upon the state treasury. Efficient government calls for efficient and capable men to handle its affairs, but so far as possible let the number of these be reduced.

* * *

The Allied army has taken possession of three additional German cities, announced as one of the steps necessary to make collection of the fund assessed against the Germans in partial reparation for the awful losses to Belgium and France. American troops have not participated in this advance but the eyes of the world are on Secretary Hughes, anxious to learn as to American participation. As a rule the American press expresses gratification because of the firmness of the Allies in demanding that Germany live up to the terms which she signed at Versailles.

PANAMA SAVES THE DAY

As we are going to press, 30 carloads of lemons are being lowered into the great hold of a ship in Los Angeles harbor, ready for a trip to New York by the way of Panama.

It seems impossible to get this fruit or other products to the harbor under economical handling, hence the fruit is going directly from orchard to ship by a great fleet of trucks. This handling by truck and ship means a saving of $240 on each carload lowered into the hold.

California has been bitterly disappointed because of the lack of use of the Panama Canal, but indications during the past few months are that the winter of our discontent is becoming glorious summer. Besides the direct saving it is certainly to be hoped that present examples of economical shipment may result in a livable railway freight tariff. This shipment is being made on the Liberator, a 20 thousand ton vessel, the largest that ever entered the harbor.

Referring to the saving in freight Lemon Sales Agent Powell of the Fruit Growers Exchange says that it totals $7500 on the cargo, or an approximate saving on the f.o.b. value of 25 per cent under existing rail freight rates."

The Liberator will land five carloads

Arizona Thurberia Weevil

In its issue of January 1, 1921 the California Cultivator gave place to an article on "The Boll Weevil in Arizona," written by Dr. A. W. Morrill. Later a letter came from Dean D. W. Working of the University of Arizona College of Agriculture, requesting publication of a letter written by Dr. Charles T. Vorhies, professor of entomology of the University of Arizona. As the letter was quite long it was not given entire, but very liberal extracts were made from it.

In Dean Working's letter to the editor of the Cultivator was a statement which we construed in an introductory note as follows: "Dr. Morrill was connected with the board of agriculture and horticulture at the time the present line of work was initiated and his association joined in requesting the federal horticultural board to make an effort to study the Arizona situation and plan a campaign of eradication." This Dr. Morrill says is not correct. He says:

"The inference drawn by the editor of the Cultivator from Dean Working's letter to the effect that there is a contention between the federal and Arizona authorities on one side and myself on the other is incorrect. Furthermore, I had absolutely nothing to do with the planning of the eradication work as conducted in the fall of 1919. This was planned more than a month after I severed my official connections in Arizona. Both Dean Working and Dr. Vorhies are well aware of this fact."

Having given Dr. Morrill's statement and one by Dr. Vorhies of the Arizona station, we believe it fair to both parties to give a statement taken from a report of the California state department of agriculture, also read at the recent meeting of the Cotton League of the Southwest, by D. B. Mackie, chief quarantine officer of the California department of agriculture. We regret Mr. Mackie's article is entirely too long to give entire.

IN DECEMBER I addressed a communication to Don C. Mote, state entomologist of Arizona, pointing out the fact that the state of California could not help but view with concern the reported appearance of the so-called Thurberia weevil in the fields of cultivated cotton in the district adjacent to Tucson and requested that he meet with me at some convenient date in Tucson in order that California might observe first hand what was being done to control and prevent the further dissemination of the weevil. I arrived at Tucson January 6 in company with Mr. Mote and Mr. Russell and visited the districts where the weevil had been found. . . . The territory in question is located in the Tucson Valley in Pima County. . . . (Mr. Mackie gave in his address very complete topographic description of infested area, rainfall and other weather conditions.)

The Thurberia, or so-called wild cotton (Thurberia thespesoides) is a malvaceous plant belonging in the same family as the cotton. It is a perennial shrub with a light grayish bark and attains a height of upwards of ten or more feet in older plants and a trunk of four or more inches in diameter. The leaves are rather small and palmate. The flowers are white and conspicuous and are borne terminally. These give place to the small bolls about one-half inch long which are generally divided into three capsules though four divisions are sometimes noted. Each capsule normally contains four small blackish seeds resembling in shape and color somewhat those of the common morning glory. As the bolls ripen they burst, allowing the seeds to be scattered. These bolls, on casual observation, seem practically devoid of any lint, though there appears in the boll a small amount which can be seen with a glass.

The plant ordinarily blooms during the humid midsummer rains, thus with the ripening and bursting of the bolls the seeds are picked up and deposited anywhere along the line of flow, being carried long or short distances according to the extent of the flood. As often happens in seasons of heavy rainfall, seeds are carried far down the wash, in fact some are carried down so far that with the following dry season, either due to insufficient moisture to sustain them, or to the low relative humidity, they lead a precarious existence and finally perish.

This land is all practically adjoining, or is immediately adjacent to either the Rillito or Pantano Washes, . . . to which the cotton areas are in close proximity, . . . within three to five miles (as a crow flies) of the permanent habitat of the Thurberia plants.

This territory, while in general good land and capable of growing cotton, has not heretofore been planted to this crop; however, with the abnormal season of 1920 and the high price of cotton in the early part of the season planting was greatly stimulated, thus areas which had never heretofore been planted in cotton were brought under this crop.

In the district above referred to this area is about 250 acres. Seemingly, however, the crop did not thrive, as I am informed by the general superintendent of the Tucson Farms Gin that the crop did not average one-fourth a bale to the acre, which is considered a low yield.

The following records the inspection and clean-up work done under the direction of the state entomologist: In the year 1919 the commission of agriculture and horticulture of Arizona undertook a survey of the location of Thurberia in the lower canyons and washes of the Santa Catalina and Rincon Mountains, acting, I believe, in collaboration with the federal horticultural board to ascertain the prevalence of this plant. This survey work was carried out in the Santa Catalina, Tanque Verde, Rincon, Santa Rita Mountains, also in the Superstition Mountains. In this latter case the work was, I believe, done entirely by a federal horticultural board scout. The Superstition Mountains are closer to the Salt River project than to Tuscon. According to report the plant was not found to exist in that range. This was later supplemented by a campaign, the object of which was to destroy the scattered plants and seedlings growing in the mouths of the washes to prevent them acting as stepping stones to the cotton lands.

As the plants were located crews were put in the districts and started the campaign of cleaning up by digging out the young seedlings and such older plants as had been able to survive in that territory. Clean-up work was conducted in the washes on the south and west slopes of the Santa Catalina and the washes of the Santa Rita Mountains which drain towards the Canoa land grant at Continental.

In June, 1920, an inspection service was initiated to determine, if possible, if the pink boll worm, or the boll weevil occurred within the state. According to State Entomologist Mote's figures, the work aggregated 605 man days and covered the following: Salt River Valley, 180,000 acres; Graham County, 3000; San Simon District, 250; Yuma District, 27,000; Pinal County, 4000; Pima County, 8000; total, 222,250 acres.

By this inspection the above mentioned infestation of cultivated cotton was found in the Rillito district. Five such infestations were discovered.

In order to suppress, if possible, this infestation, a clean-up was started. The picking of the crop was allowed, such seed cotton being held in the fields, however, which were in quarantine.

Immediately after picking was completed the plants were cut down and the fields thoroughly raked to clean up all bolls that had fallen, all of this being burned.

On January 7 when I visited the entire area the field work was practically completed. The work was thorough and there was little evidence of bolls being left. At this time the seed cotton was still in the fields in heaps waiting to go to the gin.

In the handling of this cotton it was first the intention of the entomologist to have the same brought to the gin house where the cotton is stored, there to be heated to a point sufficient to kill possible weevils, and then gin same. Such procedure had been discussed with Mr. Marlatt of the federal horticultural board and I am informed the plan met with his approval.

On January 7 a conference was had with Superintendent Turner of the Tucson Farms Gin, relative to the handling and disposition of this cotton.

After a consideration of the problem from different angles it was finally agreed that after all other cotton had been ginned the quarantined cotton should be brought in and ginned separately, the seed kept separate and the lint baled, all seed to be crushed and returned to the owners to be fed locally to livestock, the premises to be placed in quarantine meantime. The gin was to be taken apart and cleaned throughout, including receiving house, screens and all apparatus. All such cleanings are to be burned, the entire work being done under the supervision of an agent of the state entomologist.

The above, in brief, represents the status quo of the infested cotton fields and their crop at the time of my inspection.

Opportunity was taken to confer with Dean D. W. Working of the college of agriculture in order to ascertain if the station entomologist, Mr. Vorhies, had collected any data pertinent to this pest. . . . Among the extended data assembled by Mr. Vorhies it is reported by him that during his investigation following the cutting and burning of the plants in the clean-up area a sucker growth appeared which in 1920 produced a crop of bolls. In these it was expected to find a large number of bolls showing infestation. Investigation proved the opposite to be the case. In this regard it is stated that every discoverable plant in the two washes where the clean-up work was carried on has been examined and not yet has been found a single boll infested with the weevil. In this connection, in company with Mr. Mote, the districts at the mouth of the Ventana Canyon were visited and a limited amount of observation work conducted in the examination of Thurberia plants. While there seemed to be a liberal crop of bolls matured in no case was any trace of infestation found.

In this connection Mr. Vorhies points to the fact that the season of 1920 was exceptionally dry, the rains of July and August being abnormally late with a corresponding light precipitation. No flood from the Santa Catalinas reached the Rillito or other districts where the infestation was found.

From observations conducted on the Thurberia it is reported that the blossoming season was abnormally delayed, the weevils not having even the buds (squares) to oviposit on, much less the bolls which they prefer. This resulted in delaying the formation of bolls until late September, it being a rare thing to see even a blossom before August 31. From his observations Mr. Vorhies inclines to the opinion that these abnormal seasonal conditions forced a flight of adult weevils which would not otherwise have occurred, resulting in the appearance of the weevils in the adjacent cotton fields.

While the above gives in brief some of Mr. Vorhies' findings, his conclusions together with other information will be presented to Dean Working in a special report.

The following day was spent at Phoenix and Tempe, and in company with Mr. Mote, we called upon E. W. Hudson. Mr. Hudson is chairman of the Arizona commission on agriculture and horticulture, being also a large cotton grower and the president of the Arizona Cotton Growers Association, and a powerful figure in the cotton industry of the state. Mr. Hudson was formerly of the United States department of agriculture, in cotton investigation under Mr. Cook.

In the course of our conference the fact was brought out that California could not but view with concern the appearance of the so-called Thurberia weevil in the cultivated cotton fields, and that while it was not proposed to take any precipitate action in the matter, our course would in a large measure be determined by the ability of Arizona to furnish assurance that a sufficient personnel was obtained by the commission of agriculture and horticulture to enforce any regulation relative to the proclamation of non-cotton zones.

Mr. Hudson pointed out the powers of the Cotton Growers Association together with his position as head of both the governmental and commercial cotton interests, and the fact that, aside from the forces of the law and a strong public sentiment, a powerful pressure could be brought to bear through the banks of the district to withhold loans from persons who might undertake to test out the state's regulations in the declared non-cotton territory. This, however, was not expected as the conditions in the cotton industry pointed to greatly curtailed cotton plantings, and that the Salt River Valley acreage planting would be less than one-third of that of 1920.

. . . The proposed non-cotton zones in the Tucson district . . . follow no fixed points but include all agricultural lands along the Santa Cruz River subject to wash from the Santa Rita Mountains where they intersect a line drawn west from Twin Buttes.

The above represents, in brief, the findings and observations made in connection with my investigation of the subject, the work of which was greatly facilitated by the action of the Arizona authorities, who did everything in their power to assist in this matter, withholding nothing and earnest in their desire that California be fully advised as to existing conditions. In connection with the cotton industry of California it should be noted that under the existing regulation cotton seed does not move into California from any part of Arizona except Yuma and Maricopa Counties.

The purpose of this investigation was to afford an opportunity to a representative of California to view first hand the conditions as they existed and to convey to the Arizona officials the interest and concern with which California looks upon this question.

In this connection it is plainly evident that the Arizona authorities are not unmindful of the possibilities of the uncontrolled spread of the weevil to cotton fields. The only question at stake is whether they will be able to carry out the provisions of the order prohibiting the planting of cotton in the proposed non-cotton zones.

As matters stand I do not feel that California is in a position to offer at present any suggestion that will assure any guarantee greater than the movement already inaugurated to this end.

Agricultural News Notes of the Pacific Coast

Northern California

Tehama County farm bureau is planning to build a grain elevator.

Central Contra Costa County conducted a squirrel drive March 7.

Loma Rica Ranch in Grass Valley is planting an additional 100 acres to Bartlett pears.

Hop men of the state association have decided to curtail acreage 25 to 50 per cent this year.

A cooperative cannery is to be constructed at Marysville by Sutter County peach growers.

Farmers of the Livermore Valley of Alameda County have complained of damage from crane flies.

The Tehama County farm bureau has decided to discontinue publishing the farm bureau monthly.

The Tehama County farm bureau has incorporated a marketing exchange, with F. T. Robson president.

In the membership campaign in Plumas County the Nuestro center takes the premium with an increase of 60 per cent.

The Nevada County farm bureau plans to hold a Nevada County products show some time in September at Glenbrook Park.

More than 100,000 acres is represented in the Colusa County unit of the Federation of American Farmers, it is stated by Secretary Roy Turner.

The Sebastopol Apple Growers Union did a $1,000,000 business for the year just closed. Over 306,000 boxes of apples were shipped out.

The Sebastopol Apple Growers Union is building a new apple packing house at Garbo Station and a 40 by 60 addition to the Graton house.

The Sebastopol Apple Growers Union recently held its annual meeting and elected E. C. Merritt, president; H. R. Harbine, vice-president; A. Frie, secretary.

The Livermore center of the Alameda County farm bureau at its recent annual meeting elected G. L. Monahan, president; Carl Jorgensen, vice-president; Mrs. C. H. McCoy, secretary.

D. J. Stollery of San Francisco has resigned from the secretaryship of the California Cattlemen's Association. Roy M. Hagen, for some time connected with the university extension service, will take up this work.

A meeting of stockmen was held at Clear Creek, Grass Valley, recently to organize a community grazing department of the farm bureau to acquire grazing privileges in the Tahoe national forest for small ranchers.

Grape growers of the Lodi district of San Joaquin County are planning to organize the Lodi Growers and Shippers League. The committee appointed to plan details is composed of W. H. Thompson, Norman D. Swim, J. V. Bare, James Prentice and W. C. Brown.

Land owners of the Providence, Princeton-Codora and Maxwell irrigation districts are planning to purchase water the coming season from the Glenn-Colusa district instead of providing their own supply. Definite action will not be taken until it is learned from the railroad commission whether a district loses its water right by waiving its use for one or more seasons.

Central California

Effort is being made to build a farmers cooperative elevator at Waterford, Stanislaus County.

Directors of the Stanislaus County fair association have decided to give up holding a county fair this fall.

The first carload of eggs shipped out of Stanislaus County was sent from Modesto to New York the last of February.

Raisin grape plantings have been heavy in the Livingston district of Merced County during the past two years.

Construction has begun on a new creamery for Modesto. It is expected to have it ready for production early in May.

A mass meeting of the Farmers Union was held at Modesto, February 22, to discuss legislation now before the state.

Lockeford, San Joaquin County, will celebrate its annual community picnic on Saturday, May 14, at Lockeford Grove.

The irrigating season has started in the Turlock district, water being turned into the La Grange dam February 20.

Horticultural Commissioner Rutherford of Stanislaus County reports planting of a half million grape vines this season.

The California Hop Growers Association has agreed to curtail its planting this year because much of the 1920 crop is still unsold.

The committee of ten on the marketing and handling of citrus fruits is planning a number of mass meetings throughout the valley.

Sentiment is being aroused through the San Joaquin Valley in favor of restricting number of advertising signs along scenic highways.

March 14 is named as the day for reopening trial of the suit of the Tulare irrigation district against the Lindsay-Strathmore district.

Sites for raisin packing houses have been purchased by the Associated at Livingston, Merced County; Chowchilla, Madera County; Tulare and Bayo, Tulare County.

Commercial secretaries of the San Joaquin Valley have organized an association which will hold monthly meetings in various cities over the valley in order to coordinate their work.

A. W. Tate, Jr., has been appointed county horticultural commissioner of San Mateo County. Mr. Tate was formerly an apple inspector under the state department in the Pajaro Valley.

The California Associated Raisin Company has bought a site for a raisin packing plant at Livingston in Merced County and is planning to construct the house in time to handle this year's crop.

The Waterford-Hickman center of the Stanislaus County farm bureau held an enthusiastic meeting on the evening of February 16 with over 200 members present. Bulk handling of grain was the subject of discussion.

Secretary Lammiman of Stanislaus County branch of the Federation of American Farmers charges that in the recent investigation of the railroad commission sufficient notice was not given the farmers to allow them to prepare their complaints.

Southern California

San Diego County claims to have 2,000 milk goats.

Ventura County last year produced 4,000 tons of walnuts.

Riverside County's honey crop of 1920 was 820 tons, selling for $328,000.

The state university offers a correspondence course in care and repair of autos.

The Riverside district is shipping out approximately 100 carloads of oranges a week.

The Brawley farm center has decided to get expert advice on means of exterminating blackbirds.

Commercial producers of eggs in Orange County are urging a protective tariff against cheap Chinese eggs.

The California Lima Bean Growers Association has sold more than two-thirds of its regular stock of Limas.

The first shipment of strawberries from Imperial Valley was sent to Phoenix, February 1, by a Brawley shipper.

The state highway between Banning and Whitewater is to be finished as soon as possible. Bids will be opened the first of June.

Residents of Palo Verde Valley, Riverside County, are getting ready for a fight against mosquitoes. The campaign last year cost $6,000.

Garden Grove, Orange County, shipped out 413 carloads of pimentos during the last season and 225 carloads of oranges and lemons.

Lemon growers of Orange County are jubilant over news of a cut in water freight rate on lemons from Los Angeles to New York from $1.05 to 70 cents.

Figures given out by County Horticultural Commissioner Call of Ventura show that six times as much sugar beets as beans are grown in that county.

Ranch workers are in ample supply in Los Angeles County, according to a statement by E. H. Hancock, district superintendent of the public employment bureau.

The first week of the membership drive by the San Bernardino County farm bureau showed a gain of 671 members. Chino was the banner district, with a gain of 152.

The largest market for Lima beans is among the Jewish and Polish people. The California Lima Bean Growers Association expects to extend the market through judicious advertising.

A meeting of cattlemen and land owners was held in San Bernardino, February 17, to discuss provisions of a bill now before the state legislature pertaining to the fence law and cattle grazing.

Orange County will take drastic steps to enforce the law governing overloaded trucks on highways. Every truck that has the appearance of being overloaded will be ordered to the nearest scale and weighed. Traffic officers will be supplied with keys to all public scales.

The South Coast Honey Producers Cooperative Exchange met in annual session in Ventura recently and elected Fred A. Parker of Lompoc, president, and Charles C. Orr of Lodi, secretary-treasurer. The exchange is composed of members from San Luis Obispo, Santa Barbara and Ventura.

The Coast and General

Three new saw mills have been put into operation near Riddle, Oregon.

A cow testing association has been organized in Deschutes County, Oregon.

Dry farming sections of Arizona report good yields of hay from Sudan grass.

The Oregon Growers Cooperative Association has placed prune bread on the market in Salem.

Official testing of dairy herds in Washington has increased more than 50 per cent during the last year.

The United States bureau of animal industry has placed sheep inspectors at Lake View and Bend, Oregon.

The March meeting of the Maricopa County Poultry Association, Arizona, will be held at Phoenix, March 12.

Celery growers in the Sanford district of Florida are asking for establishment of federal grading rules for celery.

Attendance at the farm and home week at the University of Arizona at Tucson was greater this year than ever before.

The state division of markets of Wisconsin has presented to the legislature a bill requiring potato dealers to hold state licenses.

Cattle growers of Arizona held their annual state convention at Phoenix, February 8-10, electing E. H. Crabb of Flagstaff, president.

The Texas legislature has passed a bill restricting aliens ineligible to citizenship from buying, leasing or controlling land in that state.

The Maricopa County Poultry Association, Arizona, has forwarded resolution to Arizona congressmen and senators at Washington favoring protective tariff against Chinese eggs.

Maricopa County, Arizona, has a poultry association which is doing some live work. It is now conducting a campaign to increase membership. Arthur G. Freeland, Phoenix, is secretary-treasurer.

Washington claims honors in the butter fat production contest between cow testing associations in Washington, Oregon and Idaho. The tests were carried on under direction of the western office of the dairy division at Salt Lake City.

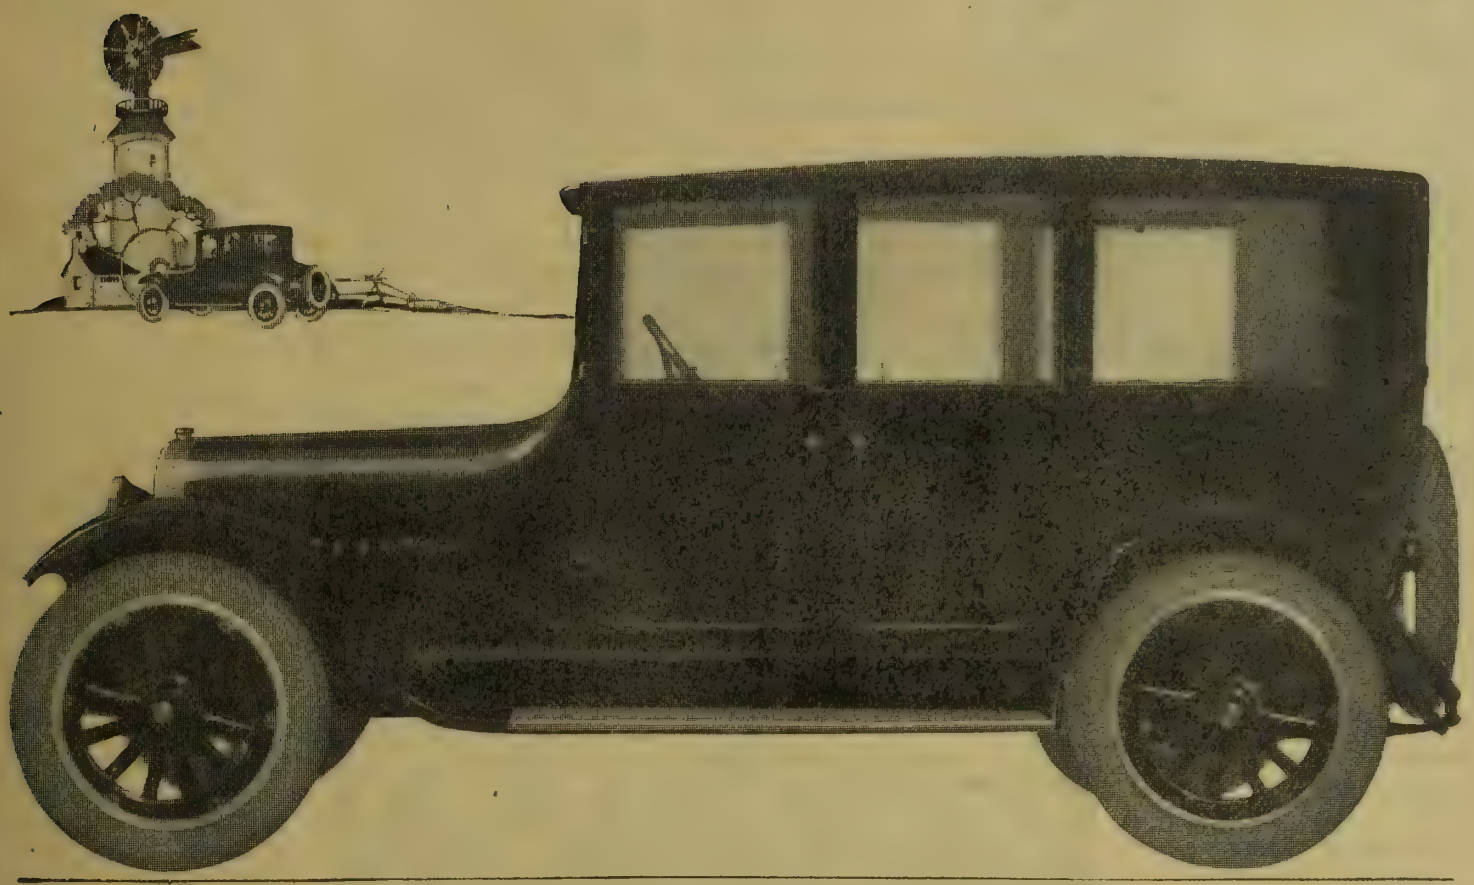
The Oregon Interstate Fair Association has elected officers for the ensuing year. The directors are M. R. Biggs, Ralph Breese, C. C. Berkeley, George Russell and Ed Slayton; officers are: President M. R. Biggs; secretary-treasurer, John B. Shipp.

At the recent annual meeting of the Arizona Cattle Growers Association a resolution was passed opposing any legislation against the packers at this time. Secretary Heinemann of the Institute of the American Meat Packers at Chicago was one of the speakers on the resolution. Former President Dwight B. Heard of Phoenix opposed.

An effort to solve the problem of developing the agricultural resources of the state has resulted in the organization in Seattle, Washington, of a state land settlement association. This is cooperating with the grange, the farm bureau and similar organizations. R. K. Tiffany of Spokane is president and Howard A. Hanson of Seattle is secretary.

Oakland

OAKLAND OWNERS REPORT RETURNS OF FROM
18 TO 25 MILES PER GALLON OF GASOLINE
AND FROM 8,000 TO 12,000 MILES ON TIRES



THIS OAKLAND SENSIBLE SIX SEDAN IS POWERED WITH THE FAMOUS 44-HORSEPOWER, OVERHEAD-VALVE OAKLAND ENGINE

THE Oakland Sensible Six engine is of overhead-valve design—a design clearly demonstrated as superior by its use in all racing car and airplane engines. The cylinders of this engine afford the nearest possible commercial approach to the ideal combustion chamber. As a result of this and other Oakland features, the Oakland owner enjoys more miles from the gallon of gasoline, more power per pound of car weight, quicker getaway, easier hill-climbing and greater flexibility, than are available in any other car at anywhere near the Oakland price.

OPEN CAR, $1395; ROADSTER, $1395; FOUR DOOR SEDAN, $2065; COUPE, $2065

PANAMA SAVES THE DAY

(Continued from Page 344.)

of lemons at Philadelphia and the rest on the docks at New York, where the fruit will be sold at auction.

GEORGE D. KELLOGG

One of California's best known pioneer fruit growers and packers died at his home in Newcastle, Placer County, last week at the age of 77. Mr. Kellogg was a Civil War veteran and has been engaged in growing fruit in Placer County since 1876. In paying tribute to him, Secretary Hecke of the state department of agriculture said: "In his passing California has lost one of its foremost figures in the development of horticultural interests, and one of the staunchest supporters of horticultural advancement. In the development of the horticultural interests of California Kellogg stands as one of the leading figures."

The fruit packing and shipping business of George D. Kellogg and Son will be continued by the son.

CALIFORNIA GOOD ROADS

Californians are highly gratified by the report issued by experts of the United States department of agriculture, bureau of public roads, on the recent study of California's highway system. The gratification is all the greater because of the fact that an effort has been made by certain engineers to discredit the work of the state highway commission. These engineers set up an idea impossible of attainment for many years to come, and because the ideal was not reached, but instead a practical system worked out by the highway commission fulfilling promises made at time the vote was cast for the issue of road bonds, the engineers issued a rather caustic report condemning the accomplishment which had saved California many millions of dollars. Almost the first paragraph in the report of the national bureau of public roads states: "an annual travel of 400,000,000 vehicle miles a year on the state highway system and a return of at least $20.000,000 in 1920 from the $42,000,000 that California has invested in its roads. * * * The total of this revenue has probably paid for all construction costs to date and would have been correspondingly decreased with less mileage." The highway commission has given the greatest possible mileage for the least possible outlay.

REDUCED FREIGHT RATE

Some of California's prune packers, those who are known as independents, have placed themselves in a not very enviable light before their fellow citizens in their endeavor to have the special rate on prunes in sack increased, or rather that it shall not be availed of. The California Prune and Apricot Growers found that it could secure more satisfactory return to the producers of California by sending the dried prunes in sacks to New York and there, equipping a small plant, have them processed, boxed or put in cartons, and hand over to the trade freshly packed fruit at lower cost than was possible to process in California and ship across the continent.

Some of the independents felt that this was an invasion of their rights and claimed that it would work loss to California labor interests, box shook interests, freight handlers and others, so they appealed to all the "loyal" to resist the efforts of the grower to secure a little money.

The effort was made necessary by the enormous increase in freight rates which made it impossible to ship at present prices California processed prunes and leave any return to the grower. Prunes which have been dipped and packed in 25 pound boxes will not stand the long shipment required via Panama, but the dried prunes direct from the trays or sweat boxes arrive in excellent condition, hence the growers, forced into a corner by the railway companies, devised the scheme of processing at the consuming point. Rather than permit this, of course the industry should be crushed. The packing houses and equipment of the cooperative association represent an equipment of $2,000,000, and through these houses pass nearly 80 per cent of California's prune crop. Those who are objecting to this great association's having justice seem to be willing that this $2,000,000 worth of equipment should be scrapped in order to save their own comparatively small equipment.

On his return from the East Manager Coykendall drew attention to some of the above facts and added: "The packers claim that 20,000 girls and thousands of men will be thrown out of employment. Only a few girls are used in packing houses since 'facing' has been done away with in packing prunes.

"The packers claim that California will lose its shook industry. The California Prune and Apricot Growers, Inc., has announced it will send every bit of its shook from California, right along with the prunes. The association, therefore, fails to see where it is cheating California out of any industry.

"If it is a crime to lower freight rates on any commodity, then the California Prune and Apricot Growers, Inc., certainly pleads guilty. We are doing, and shall in the future,. do everything in our power to assist the prune industry in every way we possibly can."

THE NEW ADMINISTRATION

The best of it all is that the new administration of the affairs of the federal government starts with the hearty good will and trust of all the people. This is true not only of President Harding and Vice-President Coolidge, but of the official family of the president. The following are the members of the cabinet for the next four years:

Secretary of state, Charles E. Hughes of New York, former governor, justice of the supreme court, and republican nominee for the presidency.

Secretary of the treasury, Andrew W. Mellon of Pensylvania, banker and financier, member of a family reputed to be among the wealthiest in this country.

Secretary of war, John W. Weeks of Massachusetts, former senator, and in 1916 a candidate for the presidential nomination.

Attorney-General, Harry M. Daugherty of Ohio, who managed Mr. Harding's pre-convention campaign.

Postmaster-General, Will H. Hays of Indiana, chairman of the republican national committee.

Secretary of the navy, Edwin Denby of Michigan, former member of congress, who has served as an enlisted man in both the navy and marine corps.

Secretary of the interior, Albert B. Fall of New Mexico, now a senator.

Secretary of agriculture, Henry Wallace of Iowa, editor of farm publications.

Secretary of commerce, Herbert Hoover of California, former food administrator and leader in various movements for European relief.

Secretary of labor, James J. Davis of Pennsylvania and Illinois, a former union steel worker who has become the highest official in the Moose fraternity.

PRUNE PRICES

Thinking that the following information may be of advantage to prune and apricot growers throughout the state I submit the following: Since Prune and Apricot Growers, Inc., started the reorganization drive independent packers have become active and offer the following prices for spot fruit in hands of independent growers of this vicinity: Prunes 20-30's, 15 cents flat; 30-40's, 9 cent basis; 40-50's, 7 cent basis; 50-60's, 6 cent basis; 60-70's, 5 cent basis; 70-80's, 4 cent basis; 80-90's, 3½ cent basis; 90-100's and up 3 cent basis; apricots that will average fancy Moorpark of good color, 17 cents per pound. These above prices would average about 7 cents per pound for Santa Clara Valley prunes.—P. F. McKinney, San Jose.

Butte County has 2600 acres planted to olives.

WORLD COTTON CONFERENCE

The second world cotton conference will be held in Liverpool and Manchester, England, June 13-22. The American delegates will sail from New York on June 1.

Whoever does less than his share makes it necessary for someone to do more than his.

New Date Palm for America

ONE of the romances which mark the history of the United States department of agriculture's plant exploration work has resulted in bringing to this country 2800 date palm offshoots of the choicest varieties of the Nile valley and Libyan desert.

These offshoots, mainly from the Saidy, or Wahi, and the Sewi varieties, were shipped from Alexandria to New York by Prof. S. C. Mason, arboriculturist of the bureau of plant industry, who first discovered their sources in 1913, and are now at the bureau's date garden at Indio. This is the headquarters for the date work in the Salton basin, comprising the Coachella Valley north of the Salton Sea and the Imperial Valley on the south, the one region in the United States combining the climatic features necessary to the successful cultivation of the choicest old world varieties of dates.

Search Lasted 20 Years.

For nearly 20 years the department of agriculture has been seeking offshoots of a large fine date known to commerce as the Wahi. These were regarded as the choicest dates obtained in Egypt, ranking next to the famous Deglet Noor of Algeria and Tunis, and with this difference, that while the Deglet Noor produces few offshoots from which young trees can be grown, the Wahi is prolific in this respect, producing from 20 to 30 offshoots in the lifetime of a tree.

Fruit of this variety had been obtained by David G. Fairchild, the department's agricultural explorer, on a visit to the Oasis of Fayum in 1901. It was known that the Wahi came from one of the oases of Western Egypt, but inquiry by Mr. Fairchild and three subsequent expensive expeditions failed to solve the problem as to the source of supply. In the autumn of 1913 and the following winter Professor Mason spent his time in Egypt and the Sudan making a careful study of the leading date varieties and the climatic conditions for their success, covering 1000 miles of the Nile Valley from Rosetta to Khartoum and the two most important Libyan oases, Kharga and Dakhla.

A journey by Professor Mason by rail to Kharga Oasis in October, 1913, and by camel train to Dakhla, found the desert people in the midst of their date harvest, a train of 40 or 50 camels starting from each district for the river every night. The visitor from the "great and friendly country," the United States, was received with true Oriental hospitality, and Abu Bakr, Omda and chief man of Rashida village, with his brother and cousin, became his host. He was the first representative of the United States department of agriculture to visit this historic "inner oasis." When asked about the dates they were sending out in such quantity, for Dahkla has nearly 200,000 date palms, the host explained: "This is the one commodity we have for export in all five of these oases. We can raise rice and wheat enough for our bread, but we must have something to sell to buy tea and sugar and cloth and get some money to pay our taxes. This date packs so well that we can send it on the long journey to the valley." Professor Mason interestedly asked the name and a moment later experienced one of those "thrills that come once in a lifetime," for his simple inquiry solved the problem that had vexed the department for 12 years.

"We desert people call the date by the same name, the Saidy," said the sheik, "but when these Bedouin traders get over to the valley with it, they call it the Wahi." To this friendly sheik was due the discovery of the true name of this valuable variety of date, and the whereabouts of a quarter of a million trees in their home in the fastnesses of the Libyan desert. Here is the key to the mystery: "Wahi" in Arabic means simply coming from "el Waha," the oasis, and the fact that the fruit was sold in the markets under this trade name, while known to the oasis growers only as the Saidy, had kept the Bedouin camel men's secret all these years.

Previous Sources Scanty

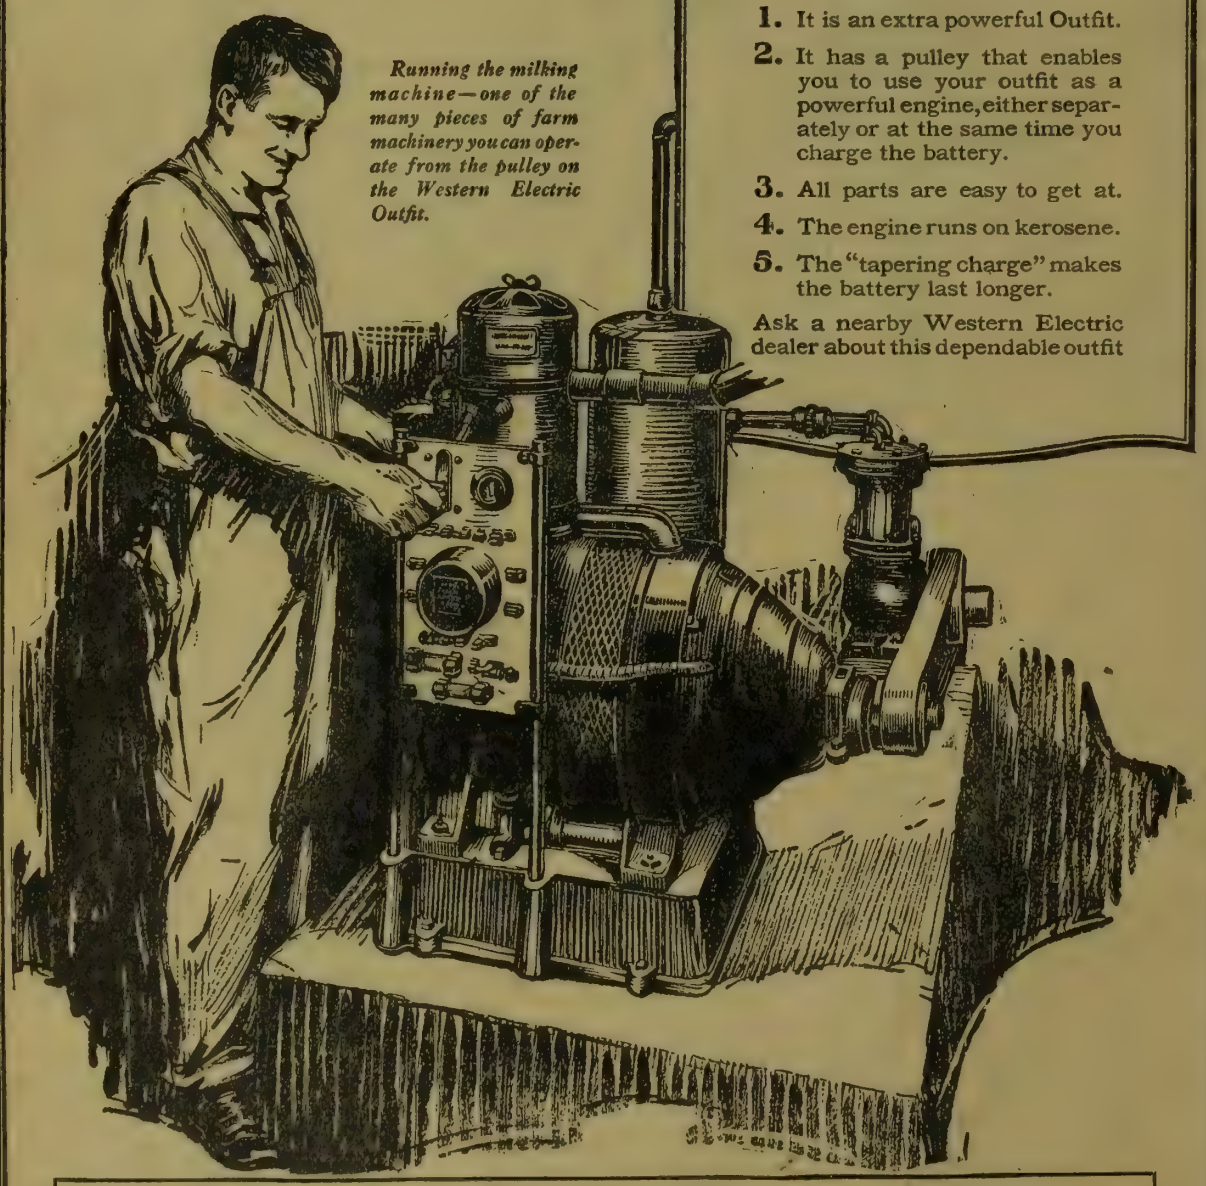
Professor Mason was able to obtain only 108 Saidy offshoots on his expedition in 1913, and these, with a very few obtained from an unknown origin by H. A. Rankin a few years previously, were the only sources for the introduction of the variety in the United States up to the time of the recent visit.

After purchasing samples of the fruit and an introductory supply of the offshoots, Professor Mason returned to Cairo where he gave close technical study to the so-called Sewi variety, the chief date of Giza province in the Nile bottom lands above the Great Pyramids and covering the site of the ancient city of Memphis.

This, the favorite packing date of this valley district, proved upon close comparative study to be so nearly like

Western Electric Power & Light

Makes The Battery Last Longer



Running the milking machine—one of the many pieces of farm machinery you can operate from the pulley on the Western Electric Outfit.

Why you should buy *Western Electric* Power & Light

1. It is an extra powerful Outfit.
2. It has a pulley that enables you to use your outfit as a powerful engine, either separately or at the same time you charge the battery.
3. All parts are easy to get at.
4. The engine runs on kerosene.
5. The "tapering charge" makes the battery last longer.

the Saidy of the Libyan oases that for commercial purposes both may be classed as one variety. This knowledge proved of the utmost importance in introducing the variety into America, as it showed the presence of a large number of trees of offshoot bearing age convenient to railroad transportation and within a short haul from the port of Alexandria. Thus, with the varietal and climatic problems worked out, and the sources of supply of offshoots determined, the journey of 1913-14 prepared the way and made possible this successful trip of 1920.

Professor Mason sailed from New York on March 8, 1920 and landed at Alexandria from Marseilles, April 5, and was soon in touch with the officials of the Egyptian ministry of agriculture at Cairo, to whose generous assistance and hearty cooperation much of the success of the trip, it is said, was due.

With an expert Egyptian gardener from the horticultural experiment station at Giza as intermediary and interpreter, contracts were made in the best localities for 1,000 offshoots of the Sewi date from upper Giza, to be delivered at the horticultural packing sheds. Another contract was made with a reliable Arab sheik whose friendship had been won on the former journey, at Kharga Oasis, for 1,000 offshoots of the Saidy variety to be placed on the cars of the narrow gauge branch railway running from the Nile over the plateau to that oasis.

Native Crate Making

Taking another leaf from the journal of 1913, the packing of these offshoots for their long journey form Cairo to Indio, California, was made in material produced by the date palm trees. Owing to the scarcity of forest timber the Egyptian natives make a great variety of ingeniously constructed crates from the strong midribs, or "gerideh," of the date palm leaves. A supply of such dates was contracted for, to be made extra strong, and of suitable sizes for packing the offshoots, which weighed from 10 to 50 pounds each.

For packing material the strong brown fiber from the base of the palm leaves, the "leef" of the Arabs, was bought by the ton. This new material proved to be ideal for the purpose, as it is at once elastic, moisture-holding and permits a measure of ventilation. During the last week of June, six railway trucks carried the first 2,000 crated shoots to the Alexandria docks, where they were placed on board an American steamship for New York. They were unloaded at San Pedro, California, September 7, and a few days later reached the Indio date garden in the best of condition.

As this variety produces offshoots prolifically, this shipment guarantees to the California date growers, in the near future, a rapid production of offshoots of a type of date not heretofore known to the commercial world, but ranking in desirable qualities second only to the world famous Deglet Noor.

RIPE OLIVE RULING

I would like to have your opinion or that of any other person on the ruling of the state board of health on the home cured olives. So far I have never heard of a case of poisoning from home cured olives. If there has been no poisoning by home cured olives I have formed the following opinion of the new ruling: The new ruling favors the canners and importers by eliminating competition of the home cured olives.

I have my doubts as to the effectiveness of the high temperature required unless good containers are used. The high temperature favors the canners because they can get a better color on the olive. I would like to know whether the temperature regulations cover the imported olives? If it does not they are adulterated the same as the home cured olives.—J. V. Dewhurst, Ojai.

The Cultivator has repeatedly expressed its opinion that it hopes the state board of health will see perfect safety in allowing sale of olives cured on the ranch where they are grown and always kept in open containers.

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Cabbage for Silos

Will you tell me if cabbage is a suitable crop for silage? I have several acres and no demand. What is the food value for hogs? Will they eat it?—Subscriber, Halcyon.

This question of making silage out of cabbage is a new one. Will ask any subscribers who have had experience along that line to give us of their information. It certainly would be making sauerkraut on an immense scale, but why make into the form of silage? Cabbages are good keepers and certainly are a good succulent for hogs. Of course one would not find them of much value as a fattener but they would be good for keeping stock in good healthy condition. They analyze a little higher in protein than mangels or other root crops; also somewhat higher in fat formers. The total dry matter in cabbage averages only about 8.9 per cent, protein 1.9, carbohydrates 5.6, fat 0.2. Henry's "Feeds and Feeding" says: "Cabbage is highly prized by shepherds when preparing stock for exhibition and is also used for feeding milk cows, Gill of England considering it superior to rutabagas. Like other plants of the mustard family it should be fed after milking to avoid tainting the milk. When cabbage is raised for market, the small heads and the leaves may be fed to stock."

Sign Your Name

If subscriber at El Cajon will send stamped envelope we will be glad to mail clipping from former Cultivator giving method of measuring hay in the stack. This question has been answered three times in the last few months and it is hardly fair to subscribers to repeat so often. This is referred to in this place to call attention to the signing of name and address in sending in questions. Many such communications go to the wastebasket because they are simply signed "Subscriber." We do not need the name for publication but there are many cases like the present one where the question can be answered immediately from former issues of the Cultivator.

Peas for Cover Crop

What kind of peas is best to plant for summer cover crop in sandy soil? My soil is full of nematodes. Can I raise peas on account of the nematodes and when is the best time to plant?—Subscriber.

The best "pea" to plant at this time of the year is the cowpea. This is, however, nothing more nor less than a bean. See article in the California Cultivator of July 3, 1920, where the methods followed on the Ed L. Dreher place near Claremont are described. Mr. Dreher plants largely to Whippoorwill cowpeas, planted soon after application of comercial fertilizer at the rate of 25 pounds per tree. Mr. Dreher persists in growing year after year cowpeas for summer and horse beans during winter. Other articles appearing in the Cultivator during the last year may be found on page 218 of August 21, 1920; page 270, September 4; page 438, October 2; page 480, October 9; page 563, October 30.

Sweet Potatoes

I am intending to plant about two acres of sweet potatoes this season. My soil is a sandy loam and I have had good success with small lots. I would like to know how many potatoes are necessary per acre for seed, what time should bed be started for early May planting, are first, second and third sprouts all suitable for planting?—Subscriber, Chowchilla.

This question is fully answered in an article which appeared on page 244 of the Cultivator of February 19.

Estray Animals

I have a neighbor who insists on turning his cattle in the road. This morning 11 head of horses came strolling my way and I saw them fussing over the fence at a pair of fine colts I have. I went over to drive them away and here was one of mine in the wire with her foot cut nearly half off; of course she got caught kicking at one on the outside. I want to know if

I can make the owner pay damages. The wire cut will damage her sale at least $25 to $50. Is there not a law that will constrain him from pasturing his stock continually on our main traveled roads? I have ample proof that his horses, cattle, hogs and goats roam where they please.—Subscriber.

These animals should be taken up as estrays and impounded. See answer to a similar question written by Attorney Stanton in issue of the Cultivator of February 26, page 279. If the owner of the trespassing stock is so situated that a judgment would be of value, and if the damage was really caused by the trespassing stock, there is no question but he would be responsible for the injury done. One should first consider the facts, however, which can actually be established and then place in hands of responsible collector or attorney.

Rabbits Eat Wood

Will you kindly tell me what makes New Zealand Red rabbits eat up parts of their boxes and pens and also tell me how to prevent them from doing it?—Subscriber, Spreckels.

Lack of salt or barks from trees is generally the cause. Feed salt in mash, making it as salty as if for human consumption or put lumps of rock salt in feed crock or use salt spools made for that purpose. Apple tree limbs are a fine tonic. Pieces a foot long are sufficient, say twice a week. Any wood must be protected by scrap iron if one would entirely prevent it, especially if it is a stick or edge of a board which they can get at. Would suggest getting a good book on rabbits which gives full instruction on hutches and feeding.—W. D. W.

Planting Eucalyptus

What is the best time for transplanting eucalyptus trees? — Subscriber.

Think perhaps the best time for transplanting these trees is any time from now until April. At least we have reset them in March and succeeded well with fairly good sized trees. As a rule the seed is planted in midsummer and protected by lath or otherwise from direct sun heat and then they are reset this time of the year.

Shaffer Raspberry

Thirty years ago there was a dark red raspberry called "Shafer's Colossal." Can you tell me if it is still grown and where plants may be procured?—Subscriber, Highland.

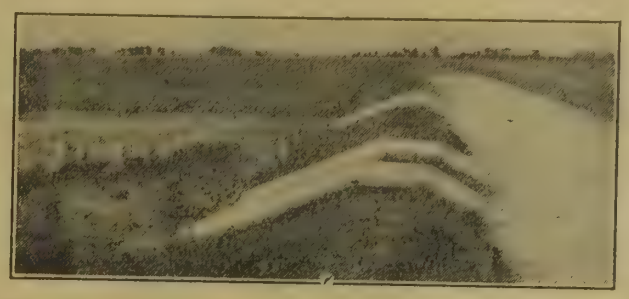
A perusal of Pacific Coast plant catalogs fails to reveal such name. Bailey's Cyclopedia of Horticulture states the Shaffer (two f's) is a purple caned variety still grown, so we presume eastern dealers list it.—E. B.

Roses in Gravelly Soil

Will you please tell me what kind of fertilizer to use for roses? I have raised many nice roses in California but the soil was heavier than here. Since coming up here I have had no success whatever. The soil is gravelly and not rich at all. We have used quite a bit of poultry manure on them and perhaps that is not good as they neither grow nor bloom to amount to anything. I keep them cultivated and watered.

Roses revel in the heavier, richer soils. We have seen them grow magnificently in 'dobe. Where one can get some heavier soil and fill in around the roots when they are planted better results will be obtained than where they stand in coarse gravelly soil. In case that is impossible fertilize heavily, mulch so as to keep the ground cool and irrigate by the basin system, thoroughly soaking the ground every week or at most every two weeks. We may add that where one is unable to get richer soil for such plants as roses, that are very particular as to their conditions, an excellent substitute is had in the compost heap. All leaves, weeds and rakings or vegetable matter may be thrown on this heap in which is mixed a portion of the best soil obtainable. Into the same mass should go the garbage from the kitchen, poultry manure, when obtainable, a bit of air slaked lime occasionally, and, in fact, everything which will add to the fertility. It will take a year or two to really make this mass into valuable material which should be at hand at all times to put around all plants or to use as a dressing for the ground. Its value may be made still greater by making a part of the heap of bone meal or even dried blood. During the summer it should be forked over and wetted occasionally In addition to soil conditions bear in mind that roses need sunshine and will not grow in a shaded place.

DO YOU IRRIGATE? Irrigating-Siphons Eliminate the Need of Gates in Ditches.



The water goes over the bank. Siphons are quickly primed—easily moved. They save water, time, expense.

Time to Plant

Fruit growing in California is the most profitable industry of the State.

Your planting a commercial orchard today will absolutely insure your financial independence five years hence, while the calamity howler of today will then be spending his time explaining why he went broke.

Your future depends upon your constructive action of today.

Plant Prunes, Pears, Plums Clingstone Peaches, Walnuts and Grapes

—all profitable according to their adaptability to your location.

These will insure your income for the future.

We have grown and marketed a million trees each year; these are now producing happiness and affluence in many thousand orchard homes.

Do not employ your fertile lands in the production of crops that do not pay, but profit by the experience and prosperity of your orchardist neighbor.

Whether planting for commercial purposes or home orchard submit us today a list of your tree wants while our foothill grown trees can still be supplied you.

Growing Cypress from Seed

How may I grow cypress trees from seed? Will cypress trees grow out again after being cut for posts?—Subscriber, Hemet.

Cypress trees are easily grown from seeds. Nurserymen usually sow in August and September, but for the reason that young trees of merchantable size may be ready, in boxes of 100 each, for winter's sales. You may plant seeds now with every prospect of success, in any well drained soil and with ordinary care. Cypress trees will not sprout again if cut for fence posts.

Olive Varieties

Will olive trees be damaged by a temperature of from 15 degrees to 25 degrees Fahrenheit? What varieties of olives are best to plant for pickling? At what age do they begin bearing?—Subscriber, Hemet.

Bearing olive trees will not be injured at the temperatures you note. Mission olives are best for pickling, Manzanillos second best, and if large sizes are desired, the Ascolano. Six years of age is as early as olives can be depended on to bear a crop.

Bitter Almonds

Where can I obtain bitter almond seed to raise seedlings for grafting?—Subscriber, Hemet.

It would be hard to find bitter almond pits for planting; better apply to nurserymen advertising in the Cultivator.

Grafting Walnuts

Is it advisable to graft walnuts or bud them, and why? — Subscriber, Hemet.

Grafting and budding both are practiced by nurserymen but the majority graft (walnuts). It is claimed quicker growth is obtained and a firmer, safer union made by cleft grafting.

Blackberries

I am thinking of putting out two acres of Cory's and Burbank Thornless blackberries, and some tell me they do not bear well and do not have much of a flower and we will not be able to sell them. Will you kindly give me some information regarding them?—Subscriber, San Bernardino.

We have no information as to the Burbank for your section, but a Tulare County subscriber, F. A. Stiles, writes: "In answer to Subscriber of Klink P. O. would say the Cory berries are great bearers if well watered and fertilized on the white ash land south of Fresno. Two crops of plants may be obtained each year. Bury every tip about October 15. These will be rooted by January 10. Cut each cane as near the rooting as possible and bury each end about four inches. By May 1 these will be rooted. Cut these loose from cane and have two good rootings for each cane.

Non-bearing Satsumas

Would you kindly advise me what is best treatment for Satsuma plum trees that bloom heavily but do not set fruit? The soil is a rich sandy loam and the trees are eight years old and very thrifty. — Subscriber, Whittier.

Satsuma plum trees are notoriously self-sterile and need polination from some other variety blooming at same time. The Climax, Burbank and Wickson are the best varieties for the purpose, in the order named. If any one of these proves better than the two others in your district, use it, but Climax is usually the best. In commercial orchards every fourth or fifth row is set to the pollinator. With two or three dooryard trees it may be better to bud a branch of Climax into the top of the central Satsuma.—E. B.

Budding Avocados

What is the best time to bud avocado seedlings? What kind of bud is best and how much wood is left on the back of the bud? Which is best, budding twine or waxed cloth? Subscriber, Oxnard.

Avocados may be budded at any time sap is flowing, but the preferred time runs from the present through June. The bud in no wise differs from that of citrus trees except that avocado buds are larger, as are all parts of the tree. Waxed cloth is used in preference to twine by all the best growers we know. Many prepare their own, dipping in pure melted beeswax.—E. B.

Italian Chestnuts

Please tell me as to soil and water requirements of chestnuts grown in Southern California. I have seen large trees in Orange County. Will they grow well in the Corona district of Riverside County, at 1,500 foot elevation, soil heavy black sandy loam, close to mountains, soil moisture good but cannot irrigate? — Subscriber, Corona.

Chestnuts thrive only in dry sandy or, preferably, gravelly or rocky soils on hillsides. They will not thrive in clays or other stiff soils. Our climate in general is a little too dry in summer. This is found to be true in Italy, Spain and southern Europe generally. Therefore plant on northern slopes or the south side of canyons. If you have such a situation chestnuts will do well and doubtless prove profitable as the nuts bring good prices.—E. B.

Avocado Not Bearing

Will you please let me know through the columns of your paper what I shall do with an alligator pear tree that has blossomed for the past three seasons but has never borne fruit? It blossoms and the blossoms stay on for a time and then fall off. Is there anything that I can do to remedy this? What do you think is the cause of it? The tree seems to be very healthy and is growing well. The soil is a sandy loam. Any information that you can give me will be appreciated. — Subscriber, Willowbrook.

You do not state if your avocado is a seedling or a budded and named variety. Budded varieties are very generally, perhaps universally, self-fertile. Many seedlings are notoriously self-sterile, and examples are known of large trees 20 or 30 years old that have never borne a fruit. Several methods of treatment have brought forth fruit, but success is more certain if all are tried, though even all may not succeed. First, stimulate tree with a small dose of nitrate of soda while in blossom; this will aid in causing the floral parts to function more fully. Second, procure flowering branch from another avocado tree and shake over the flowering branches and then toss branch up in top of tree and leave for a few days—bees and other insects may assist in cross-pollination. Third, ring-bark or girdle a few large branches near the base of each or fairly close to tree trunk. Take out a complete ring of bark, down to the wood, a quarter of an inch wide. One other method remains before a drastic surgical operation or removal of tree, and that is to plant another tree not more than 50 feet distant. If the two flower at same time both may fruit; neither may. If all these means fail have the tree top-worked; that is, grafted or budded to one or more good named varieties. The latter treatment is recommended without recourse to the others, and the work may be done any time during the next three months.—E. B.

SUGAR BEET GROWERS ORGANIZING

By James P. Britt, State Market Commission.

Considerable impetus was given to the affairs of the proposed beet growers association at a meeting of the organization committee held in Santa Ana, when Fred Bixby, a large land owner, and for many years a resident of Southern California, stated very emphatically that he endorsed the movement.

The proposed organization of sugar beet growers of Southern California indicates that the growers intend to have something to say as to what they shall receive for their beets, instead of, as heretofore, turning their produce over to the sugar refiners and then permitting the manufacturers to tell them what they will give them for the beets.

This does not mean that the consumer will pay more for the sugar, but that the grower of beets will receive a greater proportion for his product than under the conditions existing heretofore.

Mr. Bixby, who owns and controls several thousand acres of sugar beets in Orange County, informed the organization committee that he was very much in favor of cooperative marketing associations as he felt that the elimination of many of the unnecessary distributors between producer and consumer would materially lessen the cost of production and distribution and ultimately inure to the benefit of the consumer.

The sugar beet growers of the state are being organized into a cooperative marketing association by the farm advisors of the different counties, assisted by the state market director.

Cooperative associations of sugar beet growers have been formed in many of the other states outside of California, and doubtless within a short time a national association will be organized, of which California will be a prominent factor.

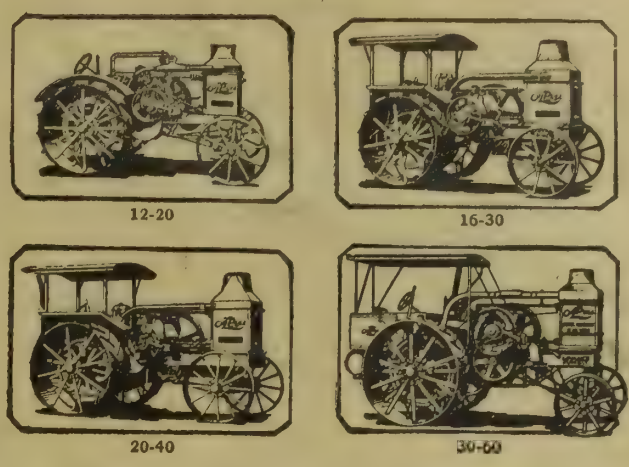
TOMATOES FROM CANARY ISLAND

United States Consul Henry at Teneriffe sends the following report: "An event which may be of considerable importance in the development of trade relations between the United States and these islands took place on December 20 when an American steamship cleared for New York from this port with over 4.000 bundles of Canary Island tomatoes on board, destined for the American market. Of these about 3,000 bundles were taken on at Las Palmas ,while 1,136 bundles, containing 72,507 pounds of tomatoes valued at $3,931, were shipped from Teneriffe. During the month of November another American steamer took a small quantity of tomatoes from Las Palmas, which is reported to have arrived in excellent condition and been sold in New York at very satisfactory prices. It is understood that the Ward Line plans to have one vessel a month stop for tomatoes en route for New York, so that there is every reason to believe that the export of this vegetable will become of considerable importance."

PEANUTS FROM JAPAN

The United States buys from Japan each year about a million dollars' worth of peanuts and more than three million dollars' worth of peanut oil, though the latter is obtained for the most part from peanuts grown in China. In 1919 Japan imported from China 25,000,000 pounds of nuts and exported to the United States a total of 14,500,000 pounds.

RUMELY OILPULL TRACTOR



A Size for Every Need

There's an OilPull tractor to fit *your* requirements, for there are four sizes—from the small 12-20 up to the giant 30-60.

Whether your farm is 80 acres or 8,000, or any size between, there is an OilPull of the correct size.

The OilPull line includes the 12-20, 16-30, 20-40 and 30-60 H.P.— all distinguished by a basic design that has been proved best by 12 years of field use. The features that have come to make the name "OilPull" stand for unequaled quality in tractor manufacture are built into all sizes. Guaranteed kerosene burning, oil cooling, double lubrication, 25% overload capacity—these, and other advantages of which we are anxious to tell you, are to be found in every OilPull.

Household Department

A CHILD'S LAUGHTER

All the bells of heaven may ring,
All the birds of heaven may sing,
All the wells on earth may spring,
  All sweet sounds together;
Sweeter far than all things heard,
Hand of harper, tone of bird,
Sounds of woods at sundown stirred,
Welling water's winsome word,
  Wind in warm wan weather.

One thing yet there is, that none
Hearing ere its chime be done
Knows not well the sweetest one
Heard of man beneath the sun,
  Hoped in heaven hereafter;
Safe and strong and loud and light,
Very sound of very light
Heard from morning's rosiest height,
When the soul of all delight
  Fills a child's clear laughter.

Golden bells of welcome rolled
Never forth such notes, nor told
Hours so blithe in tones so bold,
As the radiant mouth of gold
  Here that rings forth heaven.
If the golden-crested wren
Were a nightingale—why, then,
Something seen and heard of men
Might be half as sweet as when
  Laughs a child of seven.
—Algernon Charles Swinburne.

HOME HUNGER

I need the sight of a friendly spire
  To cure the longing that troubles me,
  The old-familiar maple tree,
The curling smoke of a cheerful fire,
The little street of my heart's desire.
  There are merry eyes that I soon must see,
  I must take the children upon my knee,
For kisses can't come by mail or wire.
Oh, the wanderer sickens in time of smiles
  Of men and women who come and go,
  And though he walk where rich roses grow,
His heart goes traveling back the miles
To the little place where his loved ones wait,
And he yearns for the joys at his humble gate.—Edgar A. Guest.

STAR LIGHT, STAR BRIGHT

(Continued.)

The most delightful time of all came one Saturday when the sun was out smiling away the cold dampness. Dick heard the larks singing when he awoke and he just felt that it would be a joyous day.

Then Uncle Toteman called fretfully that he had the "neuralgy" and could not go to the shop. So Dick got dressed and hurried off.

He unlocked the shed door and the rabbit hopped out, sniffing the spring breeze contentedly (its lameness had disappeared). Dick picked it up and ran under the trees into the wood. He did not stop until he found an open space among the oaks, with the sun beating down upon the moist ground.

What fun it was to watch the rabbit smell eagerly of each root and twig. It frisked about like a kitten and kicked out its legs until Dick rolled over and shouted with laughter.

And that wasn't all. There was the most wonderful secret you could imagine. That very day the teacher had read aloud a story of a lame white rabbit that came to live with a little boy and on Easter morning the boy was greatly surprised to find a grass nest of eggs outside his door, for he hadn't known at all that it was an Easter rabbit.

So, as Dick munched an end of Bunny's carrot, he was almost too happy. To be sure, his rabbit was black and didn't seem to care about much except eating; but what would prevent it from turning out to be an Easter rabbit? Easter was almost here, and without a trace of self-pity, Dick really thought he ought to be remembered then for Santa Claus had passed him by with only a small bag of candy from the town Christmas tree.

Toward noon, however, the weather grew cooler instead of warmer, and the sun went under a cloud. Dick shivered. He had just been thinking that perhaps Uncle Toteman wasn't so bad after all, maybe he would let him keep the rabbit at home. But as the spring warmth died away, Dick's new hope died also. It didn't seem possible that Uncle Toteman would have a rabbit around, even an Easter rabbit. This probably wasn't an Easter rabbit anyway, but Dick loved it just the same. With a passionate hug he took the pet into his arms and started home through the darkening wood.

He had just had time to close the shed door when Uncle Toteman came limping around the shop.

"It's high time you was appearin'," he called. "A poor man can't stay home from work even if he has got the neuralgy. Hustle and fill your coal pail."

The days got colder after that, though it was almost Easter. Dick used to shiver under his quilt and long for the furry rabbit to snuggle against his back.

A few days before, he had discovered some white hairs on the rabbit's neck and a wild hope again took possession of him. Could it be possible that he really would find a basket at his door Easter morning?

Often Dick looked longingly but vainly for more signs until two days before Easter when the teacher read another story to the class. In this the Easter rabbit was black and didn't change at all until twelve o'clock Easter Eve, when he suddenly stood up, on his hind legs, took a basket from a secret corner and filled it at the Fairy Shop in the deep wood, depositing it afterward before the bed of the child he loved most.

There was no doubt in Dick's mind now. The story really could come true. He fed his rabbit with a new reverence and stroked the glossy fur respectfully.

(Continued next week.)

PLACING CHILDREN IN HOMES

The Children's Home Society of California, located at 2414 Griffith Avenue, Los Angeles, has for more than a score of years been engaged in finding homes for homeless children. Finding the child for the home has been exceptionally easy, but finding the home with door open has not been so easy although thousands have received attractive little folks with possibilities of a great future. The society now wishes to know of more of these homes and, further, in order to carry on its work appeals to those who have property to increase the endowment of the institution and permit its work to be carried on more successfully.

We can conceive of no greater comfort in the sunset days of life than to be assured that the property you have acquired by hard toil, persistent self denial and frugal living — that this life's saving after your passing shall forever be used in child saving. The directors desire to so increase the endowment that the interest upon it shall carry on the work and thus all expensive ways of collecting funds be eliminated. The directors thus present the claims of the homeless children and ask your support. Let it be said of this state that not one child appeals to us in vain. More than 300 children yearly pass through this home to permanent homes.

HOUSEHOLD QUERIES

Potato Cakes and Nut Bread

Seeing in the issue of the 19th a recipe wanted for potato pancakes and in last week's Cultivator a request for nut bread I will send them, as both are very good.

Potato Pancakes—Grate the raw potatoes and to every soup plate full add one egg beaten very light, a handful of bread crumbs, ½ teaspoon of salt. Mix and bake in plenty of hot lard or oil. Do not dip off the water as much of the starch will be lost, and use no flour as that will make them tough. Use no baking powder as the eggs are all that is needed to make them light, and bake slowly to give the potato time to cook. Fry a crisp brown. Meat is not needed with this dish; serve fruit or pickles.

Nut Loaf or Bread—1½ cups flour, 1½ cups cornmeal or corn flour, 2 cups graham flour, ½ cup molasses, ½ cup brown sugar, 1 cup raisins (or ½ raisins and ½ nuts or all nuts and omit raisins), 2 cups sour milk, 2 teaspoons baking powder, 1 teaspoon soda dissolved in a little hot water, 1 teaspoon salt. Bake in loaf; very good for sandwiches.

Lemon Cucumber Seeds

I saw in the Cultivator of February 19 recommendation of lemon cucumber, but am unable to get seeds here. Could the Wasco housekeeper help me to get them?—Reader, Ventura.

Lemon cucumber seed may be obtained from any seedsman advertising

"Standard" PLUMBING FIXTURES

The appeal of a modern bathroom is universal. To have one is to possess a constant source of health and comfort—to lack one is to miss more than you realize. It deserves your careful consideration in the improving of your present home or in the building of a new one.

Better bathrooms make healthier homes.

Write for copy of catalogue "Standard" Plumbing Fixtures for the Farm." It is illustrated in colors, shows complete bathrooms and fixtures, as well as model kitchen and laundry.

in the Cultivator. A packet is sold at the regular price of other seeds and will be sufficient for a large garden planting.

Raised Doughnuts

I read with much interest your paper, also the home department, and find many good things given there. Would like to know if in your columns some good housewife will be so kind as to give me a recipe for raised doughnuts "like those you buy." Have tried numbers of recipes given in cook books, but without success.

Am sending a devilsfood recipe which I think is great and have never known to fail.—Subscriber, Vacaville.

(For answers to this or any other question asked in this department, published in the Cultivator, we will gladly extend subscription credit.)

HINTS FROM HOUSEKEEPERS

Devil's Food and Filling

First part: 1 cup grated chocolate, ½ cup sweet milk, 1 cup dark brown sugar. Stir and bring to boiling point. When sufficiently cool add to second part.

Second part: Mix 1 cup brown sugar, 3 tablespoons butter, yolks of 2 eggs. Add 1½ cups sweet milk and flour enough for medium batter, sifting with flour 1 teaspoon baking soda, ½ teaspoon baking powder.

Filling: 2 cups sugar (white), ½ cup water. Boil until heavy thread from spoon. Beat whites and add syrup to them when done. Beat constantly and when nearly cool add 1 cup chopped nuts or use plain.—Subscriber, Vacaville.

Recipe for Making Yeast Without Using Yeast Cake.

Cook two ounces (or about two handfuls) best hops one-half hour in nine pints of water and run the liquid through a colander while hot. Add two ounces (about one-half teacup) fine table salt and one-half pound sugar to this. Let the liquid cool to about blood warmth (98 degrees) then sift one pound warmed flour into a crock, make a depression in the flour, pour the lukewarm liquid slowly into this, stirring it in steadily until all is thoroughly mixed. Let this mixture stand for two days in a warm place. During this time thoroughly stir daily three or four times with a spoon. On the third day cook three pounds potatoes, mash or press through a colander and mix in with the first mixture. After the whole has stood one day in a warm place there should develop upon it a thick, dark froth. Thoroughly stir all together, pass it through a sieve or cloth and put into a stone jug, cork well and tie cork on securely with a cord. The yeast must be kept in a cool place. It will keep for months. Every time some is to be used the jug must be well shaken to mix contents. The quantity to be used is about the same as of other yeasts. —A. H. E. S., Santa Barbara.

Another Nut Bread Recipe

In answer to Fullerton Subscriber's request for nut bread recipe would like to send my recipe which is both simple and good: 2 cups flour, 1-3 cup sugar, ½ teaspoon salt, 2 teaspoons baking powder, 1 cup walnuts, 1 cup milk. Sift dry ingredients. Add nuts, chopped not too fine, then add milk to make a soft dough. Put into small, greased loaf pan. Allow to stand 20 minutes. Bake in a moderate oven about 40 minutes.—Mrs. E. C. Parr, Carpinteria.

Household Helps

A splendid "bathrag" is made by saving small pieces of toilet soap, dropping them in a small salt sack which has been boiled. When quite a few have been collected tie the sack shut and use as a cloth. Saves time when taking a bath.

Crumb Cake—Here is a good cake recipe for the busy housewife as it requires no frosting: Two cups flour, 1 cup sugar, ¾ cup butter. Rub these together until it looks like crumbs. Take out one cup of it, mix the rest with 1 cup sour milk, 1 teaspoon soda, 1 teaspoon cloves, 1 teaspoon cinamon, 1 egg, 1 cup raisins, 1 cup currants. Put in pan, sprinkle crumbs on top of cake, put in oven to bake. This cake is good for a busy mother to make, as it requires no frosting.

Nut Loaf—I just noticed a call for nut loaf, so will give mine: Four teacups flour, 4 teacups baking powder, ½ cup sugar, teaspoon salt, 1 cup chopped walnuts. Mix all dry and add 2 cups milk. Put in pan and let rise 20 minutes. Bake 40 minutes.

Caring for Children's Feet—I want to tell all moths of small children something very helpful in caring for small children's feet. Do not cut the corners of the nail of the great toe nor the next toe if you wish to prevent ingrown toenails. Cut the nail straight across. I once read this in a paper when my first child was a baby and I always did this. As I had known the terribleness of ingrown nails myself I also did the same to mine. It took some time to overcome the tendency of the nail to curve down but by patience I overcame the difficulty entirely. My five children are nearly grown now and they have never suffered with the trouble.

Add Dry Yeast Every Other Week

In reply to inquiry from mountain subscriber about making homemade yeast I am sending the following, which I have used and found satisfactory:

Three or four medium sized potatoes, 1 quart hot water, ¼ cup sugar, 1 teaspoon salt, 1 cake yeast soaked in one-fourth cup likewarm water. Grind potatoes through food chopper into hot water. Boil five minutes, stirring constantly. Add sugar and salt and allow mixture to cool. Add yeast as soon as it is lukewarm. Keep at a temperature of about 65 degrees or 70 degrees (ordinary room temperature) for 24 hours, when it is ready to use. A good container for it is an earthenware jar or enamelware pail which should be scalded before using. It should be kept covered and placed in a cool, dark place. About a half cake of yeast should be soaked in lukewarm water and added about every two weeks to keep it growing.

It requires about one cup of this for four loaves of bread. When making a sponge in the evening a pinch of ginger added will help keep it warm and will not be tasted in the bread.—Mrs. Ralph W. Trowbridge, Orland.

SOME USES OF LEMONS

By Martha

For breaking up a cold there is nothing better than hot lemonade taken upon retiring. This is made by putting the juice of two lemons in a pint of hot water and boiling two or three minutes. Sweeten to taste and drink as hot as possible.

One of the best remedies for a cough both for children and grown people, is made with the juice of three large lemons, same quantity of boiling water, sugar enough to make a thick syrup and alum the size of a bean, pulverized. Mix well, let boil up once and take off to cool. Dose, one teaspoon every hour. In case of a sudden hoarseness lemon juice and sugar will often give speedy relief, and for obstinate hoarseness or when croup is feared, lemon juice and honey is an almost certain cure.

Two or three slices of lemon in a cup of hot tea will often ward off a headache.

It Lasts as Long as the Building

Beaver Board walls and ceilings will never need replacing.

Think of it. You will never have worn, unsightly wall paper, you will never have cracked walls and ceilings, you will never have falling plaster if you use Beaver Board in your new home.

But rather you will have sanitary washable walls, beautifully panelled and decorated, walls that will be as permanent as the wood-work and hard-wood floors.

And besides there are other advantages of Beaver Board on the farm. The question of labor will be a simple one. The workmen who do the rest of your building can erect Beaver Board. You can do it yourself if you wish. There'll be no long waiting for plaster to dry. The same men can stay on the job from beginning to end. Time saving and money saving.

Beaver Board comes to you in large flawless panels ready to nail to the studding of new buildings or directly over old cracked plaster and wall paper. The pictures here show what an easy operation Beaver Boarding really is and what an attractive result you will get provided you use genuine Beaver Board.

Beaver Board is sold by lumber and building material dealers. The next time you come to town visit the Beaver Board dealer. Write for our new book "Beaver Board and Its Uses," and ask for a color card of Beavertone, a velvety flat paint made especially for decorating Beaver Board.

PATTERN DEPARTMENT
California Cultivator
Los Angeles

Lemons shoudl be an indispensable article on a woman's toilet table. The finest of manicure aids is one teaspoon of lemon juice in a cup of warm water, and one of the best lotions for the hands is equal parts of lemon juice and glycerine in which a little boric powder is dissolved. To rub the feet with lemon juice when they are tired and burning refreshes them wonderfully, then a little dry boric powder sprinkled in the shoes gives much ease and comfort, and if this treatment is kept up every day the feet can be kept in fine condition.

A good and harmless remedy for freckles is made with four parts of lemon juice, two parts sugar and one part boric powder well mixed and applied occasionally. The juice of a lemon rubbed on the skin and allowed to dry is excellent for clearing the complexion of blotches as well as improving the texture of the skin. It also prevents tan and freckles. A good and safe powder to use on the face and hands after using lemon juice in any way is made with equal parts of boric powder and pulverized starch.

One can have the hands in strong soap suds without injury if the hands are rubbed with lemon juice immediately after.

A lemon sliced and served skin and all after eating onions will destroy both the taste and odor of the onions, and the skin seems more effective than the juice.

The squeezed halves of lemons are excellent cleaners of forks, knives and spoons.

TRIMMINGS FOR SMALL DRESSES

"For the busy mother who wishes ta make her children's clothes attractive with as little expenditure of time and money as possible, the novelty braids and trimmings offer an easy solution," says Charlotte E. Carpenter, of the Colorado agricultural college. "They simplify the making and add to the charm of the garment without increasing the laundry problem."

These trimmings come in colors, all white or white and color. They may be had with one fancy edge and used in place of facing, lace or embroidery, or with the two straight edges and used as banding. The bandings are decorated with fancy stitches. Some have tiny animals, birds or other figures which delight the small child.

The trimmings are put up under various trade names in small packages containing three, four or six yard lengths. The price ranges from 15 to 25 cents a package.

There are also the six yard packages of bias lawn and cambric in white or color which come in different widths and should have a place in every woman's work basket.

WHIPPING CREAM

There are a few facts to remember in whipping cream. In the first place it should contain from 25 to 30 per cent butterfat; second, it should be from 12 to 24 hours old; and third, the temperature should range around 50 degrees Fahrenheit or lower, the nearer the freezing point the better. Before beginning have cream cold, chill vessel in which cream is whipped as well as beater, and do whipping in cool room. Another factor very important to a stiff whip is the aging of cream from 12 to 24 hours at low temperature. This allows a small percentage of acid to develop, thus rendering the cream more viscous. In this condition air is more easily incorporated into the cream and as a result a stiff whip is produced.

It is often necessary to whip fresh cream, that which just comes from the separator. In this case add one and one-half teaspoons lactic acid to each pint of cream and the aging effect is the result. It is possible to purchase lactic acid at the drug store.

RAISIN PIE

One and a half cups seeded raisins, 1½ cups boiling water, grated rind and juice of half a lemon, 1 tablespoon flour, ½ cup sugar, ½ cup finely chopped walnuts. Cook raisins in boiling water until tender, mix flour and sugar and add to raisins, stirring until thick. Beat the eggs, add lemon and combine mixtures. Let cool slightly and bake between two crusts.

Poland China Breed Promotion Assured

Of particular interest to those who favor Poland Chinas is the announcement that a general promotion plan has been worked out for conducting activities for the breed during the current year. The decision was made last fall to pool the resources of the three record associations and for the general administration of the money by a representative committee of three directors from each of the three associations. The raise in recording fees provides the funds necessary to carry on this work, and a budget has been arranged on which to base expenditures for the coming year. A total available fund of $60,000 is provided.

A meeting of the Poland China Breed Promotion Committee, held in St. Louis, Missouri, January 25, resulted in the appointment of P. W. Young, W. O. Garrett and C. G. McCahan as an executive committee to take active charge of this work. Headquarters are to be opened at once in Peoria, Illinois, where Mr. Young expects to devote all of his time to the work. Mr. Garrett and Mr. MaCahan will not move to Peoria, but will devote attention to active field work.

The multitude of details has not, as yet, been completely worked out, but at last it can be said definitely that both the futurity shows for the state fairs and the promotion shows for the county and district fairs will be continued for the coming year, that there will be some bright, readable literature available to send out to those interested in Poland Chinas, and that a definite program of support for the pig club boys and girls will be conducted.

At the California Holstein-Friesian Association

Guaranty Sale

Thursday, March 17, 1921, State Fair Grounds, Sacramento, Cal.

You Have the Opportunity to

Pick a Plum

By buying DEAN FAYNE SEGIS 320932, a young bull 14 months old—with the best of breeding—splendid type—whose five nearest dams average more than 30 pounds butter in 7 days—he is almost white and large for his age.

Buy a Pearl

And you will if you bid last on PEARL NA DEAN DE KOL 601299, that has just finished a 7 day record of 24.01 lbs. butter from 581.3 lbs. milk in 7 days, freshening at the age of 2 years and 7 days. She is a beauty, a prize winner at 1920 California State Fair in three classes.

Wear Diamonds

is a certainty with such stock as DEAN FAYNE SEGIS and PEARL NA DEAN DE KOL, as they are always worth more money than you pay for them. See them and judge for yourself.

PEARL NA DEAN DE KOL'S DAM has two 31 pound full sisters, and she is now on yearly test with 554.5 pounds butter from 12,659.7 pounds milk in 188 days, and will qualify in the 305 day division.

See her before the sale, and call and see her full sisters in blood at

Shady Glen Stock Farm

Dean Beeman, Prop. Woodland, Cal.

MRS. NETTIE ANDREWS POLAND CHINA SALE

The sale of Poland China bred sows and gilts held by Mrs. Nettie Andrews, Modesto, Monday, February 28, was successful in every way. While the crowd in attendance was very small, they were there to buy and the prices received were satisfactory and profitable. The present price of pork and the low price of feed, as well as the fact that the feeding of hogs is not only the most profitable way to market the cheap feed available, but practically the only way it can be marketed at the present time, is causing the farmers to support the sales of pure bred hogs. At the present time hog feeding is more attractive than it has been in years. As in other sales practically everything sold went to new men, many of whom were buying their first hogs at auction.

Colonel George Bell, assisted by John Davis, sold the offering to the following buyers:

1, Clyde Ayers, Modesto, $85.
2, John Glusing, Winton, $57.50.
3, C. E. McKnight, Modesto, $60.
4, G. A. Allen, Modesto, $57.50.
5, P. E. Mitchell, Atwater, $60.
7, C. M. Clary, Watsonville, $270.
8, E. L. Orchard, Hughson, $80.
9, C. E. McKnight, $65.
16, E. R. Byers, Tracy, $57.50.
17, Miller & Lux, Dos Palos, $60.
19, P. E. Mitchell, $80.
21, H. R. Briggs, Modesto, $52.50.

HUGH C. SHINN DISPERSAL SALE

The dispersal sale of the Fortuna herd of Poland China hogs held by Hugh Shinn, Tulare, Tuesday, March 1, failed to attract buyers from a distance and as a result much of the stock sold below its real value. A small crowd was present, hardly enough to absorb so large an offering. However, the average of $60 per head on 50 animals, including fall pigs, was not far below Shinn's expectations. There was keen competition for some of the gilts in the 1920 show herd and

COMPLETE DISPERSAL

Jane Garden Farm

Registered Holsteins

180 COWS and HEIFERS 180

Jane Garden Farm, Sacramento, Cal.

April 6-7, 1921

Due to the death of his father, who resided in the state of Utah, Mr. Fred W. Kiesel, owner of Jane Garden Farm, Sacramento, is required to devote a large portion of his time to estate affairs, which demand his absence for long periods.

He has accordingly decided upon an immediate dispersal of his unusually fine herd of purebred, registered Holstein-Friesian cattle, realizing that a herd brought up to its present standard of breeding and efficiency must continue to have much of his attention to maintain this standard.

It has been decided to hold an auction sale on Jane Garden Farm, in the Natomas District, about 12 miles north of the city of Sacramento. The entire herd of 180 females and the four herd bulls will be sold without reserve or limit, guaranteed to be breeders, but not tuberculin tested. No young bulls will be offered in the dispersal, as the regular patrons of this herd will absorb the young bulls on hand.

The herd has for years been under official test, and practically every female of mature age has a 7-day, 30-day or yearly record. This is an unusual opportunity for breeders, dairymen and beginners to obtain the results of real development all at one time.

Mr. Kiesel announces that he is prepared to extend buyers any accommodation required, consistent with financial responsibility.

Applications for credit in this sale may be made now, either in person or by letter, to Fred. W. Kiesel, California National Bank, Sacramento, California.

REAL DAIRY COWS

DISPERSAL SALE A. E. GREENE HERD

36 High Grade Holstein Cows and Heifers

State Fair Grounds, Sacramento, Cal.

Friday, March 18, at 1 P.M.

To make room for purebreds, Mr. A. E. Greene, Hood, Calif., will disperse at public auction his widely known herd of high grade Holsteins. In the Sacramento-Yolo Cow Testing Association this herd won:

Highest average for herd of any size, 393 lbs. butterfat.
Highest average for herd of 20 to 50 cows.
First and second for highest individual production, under 5 years, both grades and purebreds competing.
Second for individual production over 5 years.

THERE ARE 18 COWS IN THIS SALE, 15 of which have cow test association records averaging 11,198 lbs. milk and 422.7 lbs. butterfat.

THERE ARE 9 HEIFERS MILKING WITH FIRST CALF IN THIS SALE, all out of the high producing dams of the herd, and practically all sired by a grandson of King of the Pontiacs.

THERE ARE 9 SPRINGING HEIFERS IN THE SALE, also out of the big producing dams, and bred to a son of King Mead of Riverside out of a granddaughter of King of the Pontiacs that made over 850 lbs. butter from over 18,000 lbs. of milk in one year as a 3 year old.

PRACTICALLY EVERY FEMALE IN THE SALE, except those just fresh, is bred to the son of King Mead of Riverside just mentioned.

THE SALE INCLUDES BROWNIE MEAD 2ND, the noted unregistered daughter of King Mead of Riverside that made 686.6 lbs. butterfat from 18,160 lbs. milk in the Sacramento-Yolo Cow Testing Association, also her daughter and yearling son.

A WONDERFUL OPPORTUNITY

Remember that this is the highest producing herd in the Sacramento - Yolo Dairy Cow Competition, and we believe it to be the highest record grade herd ever sold in California. Sell half a dozen boarder cows and buy one of these profit makers, it's good business.

Auctioneer: COL. BEN A. RHOADES, Los Angeles
Owner: A. E. GREENE, Hood, California.
Sales Manager C. L. HUGHES, Sacramento

in the September pigs that were being grown for this year's shows. The top of the sale was No. 10, Orange Lady, the 1920 junior champion bought by R. F. Guerin, Tulare, at $230. Bassett Bros., Hanford, A. J. Elliott, R. F. Guerin, Clyde Horr and Willis Rehard, all of Tulare, were heavy buyers, Bassett Bros. and Elliott buying the show prospects. Colonel George Bell, assisted by John Davis, sold the offering in rapid order. Following are part of the sales:

1, J. M. Crawford, Fresno, $105.
3, Geo. V. Beckman & Sons, Lodi, $150.
4, J. M. Crawford, $165.
5, Bassett Bros., Hanford, $100.
6, Chas. McNeil, Fresno, $90.
7, Clyde Horr, Tulare, $60.
10, R. F. Guerin, Tulare, $230.
11, A. Buckland & Son, Fresno, $75.
12, Clyde Horr, $95.
13, Clyde Horr, $75.
17, Clyde Horr, $75.
27, A. J. Elliott, Tulare, $110.
28, A. Buckland & Son, $60.
31, A. J. Elliott, $115.
32, A. J. Elliott, $55.
35, Bassett Bros., $75.
37, Bassett Bros., $65.

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Necrotic Stomatitis

What are the causes and remedies for pigs having nacrotis (bull-nose)? —Subscriber, Arizona.

Sore Mouth. Lack of appetite. Causes: Improper feeding. The kind of feed continued for a long time is likely to bring on conditions that will encourage the germs that cause the sore mouths. The stomach is affected as well. Remedies: Change the feed. Give sour milk if possible. The lactic acid in the sour milk spells death to the germs and will encourage a healthy action of the stomach. Fresh, sweet milk from a separator is not good for hogs: put it in a barrel and let it sour; just before feeding mix plenty of good meal in it—corn meal is best. To heal the sores about the mouth and in the mouth dissolve one ounce of powdered alum and four ounces of common borax in a gallon of water. Apply this in and around the mouth with a swab. It will not hurt if they swallow some of it. Give some bicarbonate of soda in the feed three or four times a week, enough so each animal will get about half a teaspoon of it.

Cold Abscess

Will you kindly tell me through The Cultivator what to do for a lump that came on my mule's shoulder about three weeks ago? At first it was large and is swollen some now, but has not changed in the last seven days. It is hard and seems to be a part of the bone. Animal has not been worked since lump appeared. — Subscriber, Somerton, Arizona.

Your description is too short. You should give symptoms more fully, but gleaning from your brief note we believe it is one of those deep abscesses caused by a bruise from the collar. There is very little pus in them and what is there is deep down below a thick muscle. They do not come to a head and do not go away. Some of the best authorities call them "cold abscesses." Because they get hard and stay so some think they are tumors and should be cut out, but that should never be done. Any flesh removed will not fill in right again. A skillful surgeon would cut straight down to the pus and drain it out then it would get well in time and be as good as before. There is but one liniment that will cure it that I know of. Here is the formula: One dram of corrosive sublimate, two ounces of alcohol, two ounces of oil of spike (artificial) and turpentine enough to make one pint. Mix, shake and apply once a day enough to wet the parts. This may not seem to have much effect at first but be faithful and apply it as directed and you will get the answer. This may bring the pus to the surface and you can feel a soft spot, open it and the end is near.

Congestion of Cow's Udder

Jersey cow with second calf, fresh about two weeks, not letting down milk properly. Front quarters inclined to be feverish. Not milk fever as udder is not caked hard but seems to be too hard to let the milk down as she should. Would injection of something into the udder be proper treatment? Milk has increased somewhat since freshening but is not more than half what she should be giving. Anxious to do the right thing at once so that cow will not be injured as milk producer.—Subscriber, Burbank.

Bathe the udder with warm water and rub it carefully but not too hard. Milk her out clean, all you can get every time. Dissolve one pound of epsom salts and one-half pound of common salt in two quarts of boiling water. When cool give it all at one dose as a drench. Be careful and do not strangle her. Feed light for a few days and give her plenty of water to drink. These powders will help to bring her to her full amount of milk again. Get them of your druggist: Four ounces of powdered gentian, two ounces of powdered nux vomica and four ounces of bicarbonate of soda. Mix and divide into 16 powders. Give one powder every evening in a mash feed. Never inject anything into a cow's udder at any time except in cases of milk fever, and then it should be done by one who is an expert and has the proper instruments. It is very easy to ruin an udder by injecting medicines into it. From your letter you seem to think that in cases of milk fever the udder is swollen hard. That is not the case, usually it is not swollen at all but the cow gets weak in the hind quarters, falls down, becomes comatose and sleeps a hard sleep until relieved or dies. In these cases we inject the udder with sterilized air. This is a job for a veterinarian and others should not try it as they usually do more harm than good.

Are You Ready?

In the marked expansion of the dairy business which is now taking place in California, pure bred registered Holstein-Friesians are taking a most important place.

As an established breeder are you ready to enact fully your part in furnishing the right kind of breeding animals as foundation for the future new herds?

In improving your own herd the most important single factor is your herd sire. What he is so will fifty per cent or more of your calf herd be.

PRINCE ALCARTRA KORNDYKE

This is the oldest son of Tilly Alcartra, the calf she was carrying when we bought her, and he is unquestionably transmitting in marked manner the great production of his dam.

His sire, KORNDYKE QUEEN DE KOL'S PRINCE, with 90 A. R. O. daughters and 28 proven sons, is recognized throughout the breed as one of the great transmitting bulls, in spite of the fact that his opportunity was comparatively limited.

His dam, TILLY ALCARTRA, whose tremendous long time production has made her the outstanding cow of the breed in that respect for several years.

PRINCE ALCARTRA KORNDYKE is a proven sire. His first five daughters to finish yearly records at an average age of 2 years 5 months, milking with first calves, average 669.35 lbs. butter from 15,245.4 lbs. milk. Two of his daughters have made over 30 lbs. butter in 7 days as 4 year olds, and one of them made 1,014.27 lbs. butter from 21,756.2 lbs. milk in one year, and another made 778.32 lbs. butter from 17,781.6 lbs. milk in 305 days.

PRINCE ALCARTRA KORNDYKE still has a large number of young daughters yet to freshen with first calf, and they promise to add much to the production records of the breed in California. He heads the high class herd of registered Holstein-Friesians owned by

THE J. S. GIBSON CO.
Williams, Cal.

Is your present herd bull good enough to breed to the cows and heifers you are making records with? Has he the breeding that should result in an improvement in his calves over their dams?

If you are in doubt about your present herd bull, come to us with your problem. If we do not have the bull to fit your needs perhaps our experience will be of help to you.

The demand for top bulls from our herd has for a long time exceeded our supply, and if you want to make sure of securing one of our best young bulls, so that you will be ready when you actually need him, it will be well to keep in close touch with us.

An investment in a real herd bull bred in the lines of our great long distance families, is one of the greatest safeguards you can throw around your herd. These families are not fads. Their worth is founded upon several successive generations of great producers closely related, and forming one of the largest proven family groups of the breed. We invite your visit or correspondence.

COTTONSEED MEAL FOR BEEF CATTLE

The importance of feeding a balanced ration is being emphasized just now by Dr. G. S. Fraps of the Texas agricultural experiment station. Dr. Fraps, after calling attention to the unsettled and low prices of agricultural products, and the necessity, therefore, for the farmer or feeder to get the greatest possible value from feeds consumed by his herds, points with force to the opportunity for profit in the use of cottonseed meal in the ration. At present cottonseed meal is the cheapest protein feed on the market and is usually worth twice its weight in corn in balancing a ration. Cottonseed meal containing 43 per cent protein is perhaps the most economical cottonseed meal on the market, since the required protein can be had with less outlay for freight than would occur in the purchase of a meal or other feed of lower protein content. Gluten feed containing 25 per cent protein is selling higher than cottonseed meal, and linseed meal, 34 per cent, is selling about like cottonseed meal.

Cottonseed meal is valuable as a fertilizer and is used extensively for that purpose. It can be fed, however, to cattle, and if the manure be carefully saved and applied to the soil a double purpose will have been served and the value of the meal to the farmer increased according to the care used in saving the manure, probably 70 per cent over its use as a fertilizer only, or, for that matter, as a feed only. It would seem, therefore, that the farmer would profit by feeding every pound possible of cottonseed meal, being careful to save the manure for fertilizer. At present the manurial value of cottonseed meal is equal to its feeding value.

At present prices cottonseed meal is a cheap fertilizer and will furnish a cheaper source of nitrogen than any other fertilizer. Feeders will do well to consider this aspect of the matter, as is so largely done by European farmers.

Corn silage is low in protein and cottonseed meal is an excellent supplement for it, as well as for the grasses of the range.

FOUR WORLD'S RECORDS BROKEN

The distinction of having broken more world's records than any other individual in 1920 goes to the Carnation Stock Farm with headquarters in Seattle. The most phenomenal record was made by Segis Pietertje Prospect, 221846, daughter of King Segis 10th, who produced 37,381.4 pounds milk and 1,448.68 pounds butter in 365 days. This enormous quantity of milk indicates that she produced her own weight (1.650 pounds) more than 22 times in a year and averaged 12 gallons of milk per day for the entire period. She is a show ring animal and one judge is quoted as having stated that she would not be at the end of any show ring in the country. She is a sister of Matador Segis Walker, senior herd sire on Carnation Farm.

A COMMUNITY LIVESTOCK ASSOCIATION THAT PAYS

(Continued from Page 343.)

at Durham have been able to obtain 380 pure bred and high grade Holsteins.

Another benefit of a community breeders' organization has been demonstrated by the association's purchase of pure bred bulls. The settlers decided that they would not allow a scrub sire in the colony and that they could save money by having that dairy association buy and own the bulls. Prof. G. H. True of the University of California was asked to help select the bulls and he, through the generosity of A. W. Morris & Son of Woodland, enabled the association to obtain King Marco Alcartra VIII, grandson of Tilly Alcartra, to head the colony herds. The association raised the money for the purchase of this bull by selling $10 debentures payable in one year. The rapid growth of dairying throughout the colony soon demanded the service

Milking Time Tells The Health Story

How often have you wondered why—in spite of the best of feeding and general care—some certain cow kept falling far below her normal milk yield?

Nearly always such a cow is suffering from lost vitality of her milk-making organs. Get a package of Kow-Kare and follow directions. You'll see a quick return to full production, because Kow-Kare acts directly on the milking cow's producing organs.

In cases of Barrenness, Abortion, Retained Afterbirth, Scouring, Lost Appetite, Bunches, you'll find the Kow-Kare treatment a reliable aid in restoring complete health.

Sold in 70c and $1.40 packages by feed dealers, general stores and druggists.

of another bull, but the association had no funds and could not sell any more debentures. A friend of the colony came to the rescue, however, when Fred W. Kiesel of Sacramento, owner of the famous Jane Garden herd of Sacramento, gave the association the very fine bull, Jane Garden Perfecto Walker. Later the association found a market for additional debentures, and this money, with that which they were able to borrow from the Durham bank, was sufficient to purchase three other bulls from the Jane Garden herd and one from the University of California.

Now that dairying has become firmly established in the colony three settlers have purchased their own herd sires and the association bulls have been sold to groups of three to five dairymen. This localizes the responsibility for the care of the animals and is a more satisfactory arrangement for all concerned.

Better marketing facilities and greater returns was mentioned as another advantage of community cooperation. That this is true has been demonstrated by the Durham cream center. The first dairymen in the colony had to sell their products independently and as best they could in the nearby cities. A few sold whole milk, while others, who had obtained separators, sold sour cream. All found, however, that the price they received did not cover much more than the cost of production. The first step in cooperation was to pool their milk by sending it to the community separator established with association funds and arranging with a Sacramento firm to take all of their sweet cream at a reasonable price. Four dairymen in the colony who made a specialty of whole milk did not join the association at first, but when the mounting costs of feed and labor began to cut into their profits they too found the association helpful in obtaining a just price for their milk.

Now all of the dairymen in the Durham settlement are members of the Dairymen's Association. The milk is brought to the community skimming plant where the buyer, a Chico firm, comes daily to get the sweet cream. The settlers are relieved of the drudgery of hand separation and the association takes the samples and makes the cream tests to the satisfaction of both the buyer and the producer. All have benefited by the change, for the buyer now obtains a superior, standardized product and is thereby enabled to pay the members of the association a premium for their butter fat.

From the foregoing it will be seen that there has been no compulsion on settlers on the part of the board. All it did was to gather certain information, place it before the settlers and advise them regarding the action to be taken. When the Delhi settlers came to organize they had the benefit of the Durham experience, and instead of taking any backward steps in regard to community action their constitution and by-laws makes this action more efficient. They have adopted one breed of dairy cattle and one breed of hogs and are to have the help of the officers of the associations of these two breeds in securing the sires and in securing favorable prices. They have strengthened the position of their stock breeders' association in regard to combating tuberculosis, and the board is holding up their hands by a rule to the effect that no loans of money will be made to any settler who does not agree to abide by the rules for the testing of all animals bought and for disposing promptly of all animals found to be tubercular.

The reason for this action by the board is that it feels that it must protect the whole settlement from infection. Durham's experience has shown that tuberculosis is a highly contagious disease, and the board does not think it fair that any reacting animal should impair the health of the livestock of all the community and its action is taken as a health measure.

Although Delhi is in a fruit growing section it seems certain that in its earlier years dairying will be the most important source of income and that, like Durham, it is to be a center of sound healthy animals of good breeding and a distinct influence for good in the development of the livestock industry in the state.

Save *on your silo*

ORDER NOW *and get early buyers' discount*

We are offering a special early buyers' discount for a limited time on the famous Indiana Silo.

We want to keep our plant operating at full capacity during the spring months. If you have ever considered building a silo, it will be money in your pocket to see our local agent or to write us at once.

CALIFORNIA DAIRY PRODUCTS

Mr. Hecke of the state department of agriculture has occasion to be proud of a thoroughgoing report of California Dairy Products for 1919-20 made by C. F. Royt, supervisor of dairy inspection, and H. G. Asselstine, factory inspector. It is issued as Circular No. 3 of the department. Regarding the report Director Hecke writes: "I am impressed with the vast good that could result to California in the legitimate exploitation of her resources and possibilities along dairy industry lines, especially such features as inviting interstate capital to invest and stimulating settlement by those of other than Oriental origin."

In addition to the very complete list of the butter, cheese and other dairy industries of California there is an appendix containing a complete list of creameries, cheese factories, cream depots, condensaries, dried milk plants, and ice cream manufacturers. These are arranged by counties. From the first paragraphs in the report we quote:

"The historians of states in the past wrote largely of battles and wars and the doings of rulers. The material for a history of present day states consists rather in facts relative to the magnitude and condition of the arts and industries. It is desirable, therefore, merely from a historical standpoint, that facts and figures on the dairy industry be accumulated and cast into durable form as a matter of comprehensive record. As these figures are accumulated year after year, developments or movements in the industry may be noted and studied, the prosperity or development of the industry may be determined, and legislative or other action may well find a working basis in such figures.

"Facts and figures on the dairy industry have an immediate value for those engaged in it. Many inquiries are received concerning such items as the production of various dairy products in different sections of the state, the names and addresses of concerns operating, etc. This circular, therefore, is an attempt to fill such a need and to answer some of these many questions. For our own people in California the figures showing production of the various dairy products in the state as well as in local communities should be of great interest. For the prospective settler seeking reliable information, such figures may have an even greater value. For all those engaged in disseminating information about the state or given localities reliable figures are desirable and they should give added impetus to the growing movement by which we hope to settle Americans on our soil and further develop the untouched resources of California.

"The fame of California fruits has spread throughout the country, indeed, one might say throughout the world. So exclusively is this the case that beyond the borders of the state, dairying has hardly been associated with its name. Even our own people, as a whole, are but faintly conscious of the vast possibilities of the industry. We manufacture a variety of dairy products that is equaled by few if any other states in the Union and we have centers of production and of manufacture that, for volume of product, are surpassed by few other sections in the country."

Thank God every morning when you get up that you have something to do that day which must be done whether you like it or not. Being forced to work and forced to do your best, will breed in you temperance and self control, diligence and strength of will, cheerfulness and contentment, and a hundred virtues which the idle will never know.—Charles Kingsley.

LIVESTOCK SALE CALENDAR

Holsteins

March 17, Holstein Guaranty Sale, Sacramento.
April 6-7, Fred W. Kiesel, Sacramento.
April 14, R. F. Guerin, Tulare.
April 21-22, Santa Anita Rancho.
April 21 and 22—Santa Anita Rancho.
May 5, Victory Herd, Carruthers.

The Shorthorn Congress show and sale held at Chicago, February 22, 23 and 24, resulted in a general average of $430. The seven head consigned by Caledonia Farms, West Sacramento, which were the first Shorthorns ever sent to an Eastern sale from this state, made an average of $530. The five females sold as follows: Fayette's Heiress, $750; Spicy Princess, $600; Bapton Princess, $725; Gay Marquis, $425, and Broadhook's Princess, $510. The Cruickshank Broadhooks bull, Assyrian, a red three year old, sold for the extremely low price of $450, and the good white calf, Polonaise King, brought $250.

At the annual meeting of the American Berkshire Congress, held at Philadelphia, D. J. Bastanchury of La Habra was elected president and it was decided that the 1922 congress meeting will be held at Riverside. This is the first time that the American Berkshire Congress has met in the West and it is expected that the Western Berkshire Congress will cooperate in the management of the event.

Princess May 12th, a Berkshire sow entered by the Italian Vineyard Company, Guasti, in the recent American Berkshire Congress sale at Philadelphia, sold for $150. The general average of the sale was $127.

The annual meeting of the Pacific Coast Hereford Cattle Breeders' Association was held at the university farm, February 23. The following officers were re-elected: J. I. Cazier, Wells, Nevada, president; H. M. Barngrover, Santa Clara, vice president; John A. Bunting, Mission San Jose, secretary-treasurer. During the meeting a resolution was adopted binding the members to an assessment of $2.50 per head for each registered female 18 months old or over owned by the members. The money so raised is to be used for defraying the expense of a fieldman. It is expected that all members will sign the agreement and that the services of the fieldman will be available at an early date.

Following a banquet at Sacramento, February 24, the Western Berkshire Congress held its annual meeting and elected the following officers: James Mills, Hamilton City, president; J. Francis O'Connor, Santa Rosa, vice president; Chas. M. Talmadge, Salem, Oregon, vice president. The directors are: W. M. Carruthers, Live Oak; H. C. Muddux, Sacramento; A. B. Humphrey, Escalon; Geo. Murphy, Perkins; Alex. M. Wilson, Guasti, and D. J. Bastanchury, La Habra.

C. O. & C. B. Lowry of Pomona were among the buyers at the Duroc sale held at Longview Farm, Missouri, and paid $260 for Miss Bob Orion, a daughter of Big Cherry King Orion and carrying the service of the popular boar, Stilts.

H. C. Muddux of Sacramento, a prominent breeder of Shorthorn cattle and Berkshire swine, is making plans to visit his old home in England within the next few weeks. Muddux says that he will visit the leading breeding establishments of England and Scotland and that he may make purchases of both cattle and hogs.

Announcement is made this week of the complete dispersal of the famous Jane Garden herd of Holsteins owned by Fred W. Kiesel of Sacramento. This herd has been in existence for nearly seven years and during that time has come to be regarded as one of the very best collections of Holsteins in the entire country. The decision to disperse the herd has been reached because of the increasing demands upon Mr. Kiesel's time by other interests and his reluctance to in any way lower the high standard upon which the herd has always been maintained. This sale will mark the passing of a herd and the withdrawal of a breeder that have been powerful factors in the development of the Holstein industry in this state, and it is entirely within bounds to add that without the Jane Garden herd the breed would not now occupy the high place accorded it in this state. The sale will occur April 6 and 7 and will be under the management of C. L. Hughes of the California Breeders Sales and Pedigree Company, Sacramento.

Dr. L. J. Anderson of Placerville has purchased 20 head of Ayrshires from J. P. Walker of Visalia and has established them at the Viking Ranch.

F. S. Borror and Son of Tipton in their first seven day official testing have made some splendid records. A junior two-year-old, Evelyn Walker Hawkeye Hengerveld, daughter of their senior sire, Prince Gelsche Walker Alcartra, made in seven days 476.6 pounds milk 20.76 pounds butter. Milking 37 days before starting test, Daisy May Belle made 647.4 pounds milk, 21.14 pounds butter. Lassie Pledge West DeKol, daughter of Lad Legend of Kakenstein, gave 518.3 pounds milk, 25.21 pounds butter. A junior four-year-old, Edith Pontiac Segis, daughter of Segis Pontiac Crane DeKol, started test 44 days after calving and made the splendid record of 565.6 pounds milk 26.34 pounds butter. Another two-year-old daughter of Prince Gelsche Walker Alcartra will soon finish a year's record of approximately 550 pounds butter and 14,000 pounds milk. In the Borror herd of 23 cows 19 have either made records or are now on long time test so we may expect some good records in the future.

H. E. Spires, Caruthers, writes: "Am pleased to report the sale of a son of Sir Piebe De Kol Segis Pontiac out of a 27 pound three year old dam to head the grade herd of Chris Layton and W. R. Boddy of Caruthers; also sale of a son of Sir Aaggie De Kol Acme 2d to W. F. Spicher of Lanare, who is starting a purebred herd at that place."

Gombault's Caustic Balsam

A REMARKABLE TESTIMONIAL TO THIS WELL KNOWN EXTERNAL REMEDY—RESULTS ALMOST BEYOND EXPECTATION. COULD WE ADD MORE CONVINCING PROOF OF ITS MERITS?

A Safe and Reliable Treatment

Des Moines, Iowa, December 30. 1920.

Time and again I have threatened to write you but have neglected. I wish you would give your "Caustic Balsam" greater publicity along several lines.

About fifteen years ago a horse bit the first finger of my right hand entirely off between the end and first joint and I asked my wife to clip a few threads of skin holding it, when I thought of Caustic Balsam which we always kept in the house, and I held it in place, while she bound it with gauze, wet it well with Caustic Balsam, kept it wet for a week or more before removing first bandage, and upon removing we found the end had grown fast. And outside of its not being on straight, there is not a trace of a scar, nor did I have one particle of pain.

My wife had a growth in her left breast the size of a goose egg, when shooting pains to the back and shoulder blade gave alarm; prior to this, she had said nothing to me, but had been doctoring with one of the best physicians, who told her it was a tumorous growth and might be cancerous. After weeks of treatment, I persuaded her to let me try Caustic Balsam. I began rubbing briskly, then rubbing in all it would absorb; this gave relief. Pains grew less. And then I soaked a wool pad, kept it over the breast for about six weeks, when it was entirely gone and no trace of it since. I recommended it to a friend for growth on the lip and he was able to entirely remove it. I used it in three cases of pneumonia in my family and it worked wonders, relieving the suffocation and pains of pleurisy. I use it half olive-oil for pneumonia, soak a wool pad large enough to cover entire chest, and leave it on a week or two or until patient has recovered.

Yours truly, THOS. J. RICE.
MAYOR OF URBANDALE, IOWA

A remedy of unequaled value. Sure in results. $1.75 Per bottle at all druggists or sent by parcel post on receipt of price. Requests for information on special cases given careful attention. A standard remedy in this country for over forty years.

The Lawrence-Williams Co., Cleveland, Ohio

LENDORRIS RANCH
Big Type Polands

We are offering a number of fine gilts by Lendorris Liberty Bond bred to Lendorris Liberator—a half-brother to the grand champion of this year's National Swine Show—for March litters.

W. L. Haag and Son, Hanford, Cal.

McNeil's Big Type Poland Chinas

Herd headed by Giant Prospect and Mc's Challenger. My sow herd is composed of a great lot of choice matrons including Polandale Betty, first prize junior yearling at Sacramento. Correspondence solicited.

CHAS. McNEIL, Route H, Box 166, Fresno, Cal.

Eastman Ranch Poland Chinas

Herd headed by Buster Bob, Grand Champion at the strong Los Angeles Livestock Show. He is the largest junior yearling in the state and is siring some great pigs. Young stock for sale at all times. Satisfaction assured.

H. L. Graham, Mgr. San Fernando, Cal.

Fortuna Herd Poland Chinas

Special prices on gilts sired by The Californian, either open or bred to The Skipper by The Pilot. Two sisters to Orange Lady, first prize senior gilt at Sacramento. Also some choice weanling boar pigs. Satisfaction assured.

Hugh C. Shinn Tulare, Cal.

Johnson's Defender Jr.

Heads my herd of carefully selected sows. He should be seen to be appreciated. I can spare a few choice females or young stock either sired by or mated to this good boar. You will be pleased with any purchases made from me.

H. C. WITHEROW Live Oak, Cal.

For Profitable Durocs

As we have sold out of bred sows and gilts, we are now offering big growthy fall pigs, either sex, at attractive prices.

Developing a High-Producing Herd

By Frank L. Morris

The following paper was prepared and read before the dairy meeting held at the University Farm, Davis, during Stockmen's Week, by Frank L. Morris of Woodland. No man in California is better qualified to discuss this subject than is Mr. Morris, a member of the firm of A. W. Morris and Sons, Woodland. The sound practices of the Morris' have brought success to themselves and honor to the state of California.—Editor.

EXPERIENCE covering a period of years in an effort to breed a high class herd has suggested some things to me which I will endeavor to mention.

It would seem that the three most essential points in the development of a herd of pure bred dairy cattle are selection, care and breeding, or in terms which are often used; weeding, feeding and breeding.

A herd of high production and individual quality is the ultimate goal toward which we are all striving, and it is impossible to outline a definite course by which it may be reached. It's the man behind the gun who counts after all. Better stock comes from better sires, better cows, better feed, better care, better dairymen. It is from the ranks of the dairymen that our successful, constructive breeders usually come. The man who has started at the bottom with limited means and by the application of efficient methods has succeeded in developing a profitable dairy herd is invariably best qualified to carry on successfully the important work of building a high class herd of pure breds.

World famous herds have been founded in numerous instances upon a few animals of mediocre quality and these stand out as illustrious examples of constructive breeding. To my mind the breeding of pure bred dairy cattle holds out wonderful possibilities to the young fellow that has some good, sound, practical knowledge and experience in the feeding, milking and handling of the common dairy cow; the ambitious fellow who is willing to get down and work and work hard for a few years. It is a business in which the big fellow can have no advantage or monopoly. Practical knowledge and good management are prime requisites to successful breeding. It may be possible to go out and buy the result of the other fellow's efforts, but the big job will be to maintain and improve upon this high standard.

After founding the herd with a few well selected cows of good type, with good udders and with the outward indications of production, comes the all important task of selecting the herd sire. We must look to him entirely for the improvement in the future herd; he is to contribute 50 per cent to every animal that is to be born in the herd, and his influence is going to be in proportion to his inheritance of the qualities that we wish to reproduce. Animals carefully selected through many generations for one particular quality will transmit this quality with greater certainty than others with which less discrimination has been exercised in breeding, and it is therefore imperative, in order to be sure of improvement, that we select a sire carrying a greater inheritance of these good qualities than is present in the cows on which he is to be used. This great transmitting power of well bred animals is the fundamental principle in all breeding operations.

The sire should carry, to as great an extent as is possible to find, the type which the breeder is striving to attain. He should be particularly strong in the places where the herd is deficient and, of greatest importance, every ancestor, both sire and dam in the first two or three generations must show evidence of unusual production. If necessary in order to secure a sire in which these essential qualities are present, a breeder is warranted, in my judgment, in paying one dollar for every dollar invested in females.

The first procedure in the line of herd development will be to place the cows as rapidly as possible on official test in order that we may have some concrete evidence of production to offer to the prospective buyer. The judicious expenditure of time and money in test work is the best investment a breeder ever makes and is absolutely essential to the successful development of the herd. It furnishes an index to the production and capacity of each individual, so necessary to intelligent selection and culling. It immediately supplies a knowledge of feeding and a greater interest is at once instilled into everyone concerned, resulting in a desire to see to every detail that tends to increase production. The objection to testing often advanced is, "We cannot afford the cost," while as a matter of fact no breeder can afford not to test. The increase in production, due to greater interest and better methods, will usually take care of the cost, to say nothing of the added value of the herd and subsequent offspring. I believe I am conservative in saying, if properly applied, that the official test will add 100 per cent to the value of a good herd.

There is frequently hidden away in the herd of some small breeder a great cow with wonderful possibilities, which with proper development might have brought fame and fortune to the owner and untold benefit to her breed but lives her life in obscurity due to the fact that no testing or development is ever undertaken by the owner. I recall an instance of a certain family that has exerted a great influence on the Holstein breed—a cow and one or two daughters, well bred, attractive individuals, showing every outward indication of capacity and production, that were purchased without official records at very moderate prices. Under the skill and care of the purchaser they responded with marvelous records year after year and transmitted their conformation and production through their sons and daughters with great certainty. Their fame spread throughout the breeding world with the result that their owner was asked for a price by a man of wealth seeking for what he regarded as the most popular family for foundation purposes. The owner was taken by surprise, having had no intention of selling the heart of his herd. After due consideration it was decided that they were worth in his own herd $25,000 each, and he put that figure on them, not caring whether it was accepted or not. They were sold and it has proved a good investment for the purchaser.

As further evidence of the results of official testing I might mention a family well known in this state. The foundation cow, an animal showing every evidence of great capacity, was purchased at a very ordinary price as a heifer. She made in official test a few years later better than 1,000 pounds of butter in a year, and her daughter by a great sire made a world's record in long distance test. She in turn was bred to a son of a noted producer, and the mating resulted in a world record two year old, the three generations averaging 1,140 pounds butter in a year. The result of mating this heifer with a sire of exceptional breeding was a bull calf which sold in public sale for $41,000. These are only two of many similar instances and are only mentioned to show the part that official testing plays in herd development.

LOOK FOR THE

Carnation Holsteins

at Sacramento Sale, March 17, 1921

Carnation Stock Farms

Matador's Record

Matador Segis Walker is a proven sire in production as well as in the show ring. Three of his daughters broke world's records in 1920. Carnation Matador, senr. 2 yrs. old, 305 day Milk and Butter record. Carnation Matador Leda, 365 jr. 2 yr. old for Milk. Carnation Pioneer Segis, jr. 2 yr. old 7 day Butter record.

Matador is brother to Segis Pietertje Prospect New World's Record cow —37,381.4 lbs. Milk in 365 days.

A son and daughter each won grand champion at Portland Show 1920, in addition to Get of Sire.

5 Cows in Calf to "Matador"

E. T. No. 164. Female. Born October 28, 1914. Has a record of 20,504.3 lbs. Milk and 922.3 lbs. Butter in 365 days. PRINCESS PIEBE JEWEL, No. 271867. Bred June 11, 1920 to Matador Segis Walker. An unusually good cow of large type —of large capacity and excellent quality proven breeding cow.

E. T. No. 828. CARNATION GELSCHE SEGIS, No. 383968. Born May 3, 1917. 2 yr. 5 mo. 4 d. She produced 18,230 Milk and 701.85 Butter in 365 days. She is sired by Johanna McKinley Segis son of the famous King Segis. She is a young cow just coming to her prime of good capacity and has a nicely balanced udder and will no doubt materially increase her production on yearly test. Bred June 5, 1920 to Matador Segis Walker.

E. T. No. 500. PRINCESS MERCEDES FAYNE, No. 318898. Record as 3 yr. old 15,076.3 Milk, 645.5 Butter in 305 days and 20.415 Butter in 7 days. She is about half white with even markings, medium size and of good type. Her sire is Paul Mooie Fayne and her Princess Mercedes Piebe 3d, with a 25 lb. Butter record at the age of 5 years. Mated to Matador July 3, 1920.

E. T. No. 2068. LACONNER NETHERLAND PONTIAC GIRL, No. 541431. Born Feb. 18, 1918. She is a big, strong, springing heifer that shows a great deal of promise. She is backed by strong breeding. Sire Segis Pontiac Acme and her dam Netherland De Kol Mutual Friend with a 22.37 Butter record in 7 days. She is ¾ black, nicely marked and bred August 13, 1920 to Matador Segis Walker.

E. T. No. 2184. HOLLYWOOD LILITH PALMYRA ABBEKERK, No. 400491. Born Dec. 24, 1916. At 2 yr. she had a record of M—477.9. B—19.84. At 3 yr. 6 mo. 27 d. Milk 546.3. Butter 22.892. She is now on yearly test and her figures will be announced at the time of sale. Her dam is Hollywood Abbekerk Korndyke with a record of 19,224.1 Milk and 818.95 Butter in 365 days. Bred December 10, 1920 to Matador Segis Walker.

See Catalog for Full Description

A Son of "King" the $106,000 Sire

At this sale we will offer Carnation King Tillie Denver. Born November 9, 1920, a son of Carnation King Sylvia. The dam at 7 yr. made a record of 558.4 Milk, and 28.906 Butter in 7 days; and Milk 2,308.4 in 30 days. This son of King Sylvia is very typey, is an unusually vigorous, growthy calf and very large for his age; heavily boned, straight and deep with a fine head. ¾ white and attractively marked.

Consider seriously tying up with this popular May Echo Sylvia breeding, — world's record from 7 to 120 days. 10 sons of King have already been placed in representative herds.

MATADOR SEGIS WALKER—CARNATION'S SENIOR HERD SIRE

We have several good sons of MATADOR SEGIS WALKER ranging from $500.00 up, according to the record of the dam. We will be glad to send you price lists upon request.

If you are not familiar with the breeding of the Carnation Stock Farms we will be glad to send you copy of our publication the Carnation Stock Farm News. Address Carnation Stock Farms, 1035 Stuart Bldg., Seattle.

There has been much discussion of late as to what kind of records furnish the most reliable index to production, short or long. Both are good and each have resulted in much benefit to the breeding business. Much might be said on the subject of feeding and handling and preparation of cows for test, but this is knowledge that is best gained from experience. It must be recognized, of course, that many things are going to affect the production of cows in official test. Proper breeding and development are of first importance, but after all man is going to play an important part in providing the opportunity and conditions under which the cow can do her best work. The public is going to judge her value by her official record in comparison with other great records, and there is no possible means of comparing opportunities or just what part man had in the making. It therefore behooves the breeder to leave nothing undone to provide the most favorable conditions and environment.

A great deal has been said on the subject of abnormality in the making of official records. We hear of "cow-made" and "man-made" records, and, while we all realize that a cow cannot be expected to transmit production, due to any artificial conditions, it is difficult to draw the line, and nothing should be left undone in the way of providing opportunity. There is a growing tendency along practical lines, and I venture to say that in the very near future more consideration will be given to the average production of a herd or a family of cows than will be given to a few tremendous individual records made possibly under somewhat artificial conditions.

In general there are just two means by which results may be achieved, first by keeping high class animals as a result of good breeding and rigid culling, and second by giving proper care and attention to those we have.

The breeding business should be taken up as a life work; it is a big job, and we cannot expect to accomplish much in a short time. The man that undertakes it with the idea of sticking through thick and thin is the man who will succeed. Next in line of importance after good management comes the building of the reputation for the herd and its owner. Good, clean, wholesome advertising must be resorted to. We must first get something to offer and then let the public know about it. A reputation must be built for fair dealing. Good will is the breeder's greatest asset.

As owners of pure bred dairy cattle we owe it not only to ourselves and our breed, but to the world, to lead in the economic production of dairy products. We should put particular stress on the raising and breeding of cattle that are of correct breed type, properly grown and cared for at all times. We should study and understand the principles of animal breeding and practice its teachings. Great care should continually be exercised in selection, and no animal retained or permitted to be used for breeding purposes which does not measure up to breed standard. Too much stress cannot be laid on this last point. No owner should use or sell for breeding purposes animals which are unprofitable or of incorrect breed type. There will always be some of this kind of pure breds and they should find their way to the butcher rather than to the unsuspecting and inexperienced buyer.

STATE DAIRY COW COMPETITION

List of cows producing 50 pounds of butter fat or over during January, 1921:

Adohr Stock Farms, Guernseys and grades: C-269, 1,539 pounds milk, 87.72 pounds butterfat; Yeksa Martin, 1,042, 69.81; C-33, 1,104, 68.45; Leota of S. S., 1,113, 66.78; C-60, 1,156, 65.89; C-93, 1,122, 58.34; C-443, 822, 57.54; C-210, 1,401, 54.64; C-88, 1,011, 53.58; C-2, 1,076, 53.80; C-29, 1,190, 53.55; C-114, 1,070, 53.50; C-329, 955, 53.48.

The 1921 Guaranty Sale

"The Pacific Coast Holstein Classic"

50 Registered Holstein Tops

State Fair Grounds, Sacramento, Cal. Thursday, March 17, 1921

CONTRIBUTORS TO SALE:

AGEE BROS., Rivera, Calif.
ANITA BALDWIN, Santa Anita, Cal.
DEAN BEEMAN, Woodland, Calif.
BRIDGFORD HOLSTEIN CO., Patterson, Calif.
BURR FARM, Los Angeles, Calif.
CARNATION STOCK FARMS, Seattle, Wash.
ROBT. N. CLAPP, Nuevo, Calif.
R. L. HOLMES, Modesto, Calif.
FRED W. KIESEL, Sacramento, Calif.
A. W. MORRIS & SONS CORP., Woodland, Calif.
R. C. STURGEON, Tulare, Calif.
TOYON FARM ASSOCIATION, San Francisco, Calif.
ALEX WHALEY, Tulare, Calif.

We have outlined in previous announcements the outstanding individual animals in this sale, and no more need be said on that score, except that when you inspect them on the sale grounds you will find their type fully in keeping with their other excellences.

Now, just how are you going to turn this event to your own advantage? Will it be through the purchase of one or more of the great females, or will it be the purchase of one of the seven wonderful young bulls in the sale?

Keep in mind the real object of this sale — to afford buyers of top Holsteins an opportunity to make selections in an offering composed only of tops. There are many, many animals in this offering that the sellers are positively not justified in letting go from their own herds, and would not part with them except in a sale such as this.

EXTRA!

Latest News

KARLRAY ORMSBY ALCARTRA, the world's record junior 2 year old for combined milk and butter in 305 days, consigned by Bridgford Holstein Co., has completed her 365 day record with 916.1 lbs. butter from 22,947.2 lbs. milk.

PEARL NA DEAN DE KOL, a beautiful 2 year old consigned by Dean Beeman, Woodland, placed on test 25 days after calving has made 24.01 lbs. butter from 581.3 lbs. milk. Take another look at that milk flow, and she was only 2 years 7 days old at calving.

SIR TOYON FLETA JOHANNA MERCEDES has been added to the sale. He is a son of Sir Pietertje Ormsby Mercedes 43d, and out of Cascade Fleta Johanna, one of the only two heifers that ever made over 30,000 pounds milk in one year.

Keep this thought in mind also—Beyond question of reasonable doubt there will be more new breeding herds of registered Holsteins established in California during this spring sale season than have ever before been started through an entire year in this state.

There is a tremendous movement back to dairy cows right now, and this movement is going to be more widespread within the next ninety days for throughout the length of the state there is the greatest lot of green feed we have had for years; there is a bumper hay crop coming on; there is prospect of a bumper barley crop; and there is a world of last year's alfalfa and barley on hand on the farms.

Right now a great many men who have the old crop of alfalfa and barley on hand, are bemoaning the loss they are going to sustain when they sell. Some of them are finding out that they will have no loss if they buy good dairy cows and market their feed through them, and others have gone still deeper into the subject and have decided that as long as they must buy cows they may as well buy registered Holsteins.

In this large expansion of California's Holstein breeding business, the man who builds right is going to build upon just as much quality as he can possibly get in his foundation, and this sale affords a most excellent opportunity for selection of the right foundation.

Spend at least part of the day before the sale in looking over the individuals, catalog in hand. The various owners or their representatives will extend every courtesy in affording you complete information about their cattle.

POULTRY

Best Chicks Grow Into Greatest Winter Layers, cost little more, yield greatest profit. Our White, Brown, Buff Leghorns, Andalusians, Anconas, Reds, Rocks, Minorcas, Wyandottes (ducks, turkeys), bred 20 years to lay winters and 180-290 eggs yearly, often clear customers $5.00. "Pullets raised from your chicks averaged 209 eggs last year"; "114 hens cleared $612 in 12 months." "Fourteen pullets laid 300 eggs January, 330 February." "Get more winter eggs from 60 your hens than from 200 formerly;" 140,000 electrically hatched. Half booked, yet nearly every week open for thousands, reasonable. Former customers take half. Don't delay. Write (rarely home) Profitable Poultry, 19 North Fair Oaks, Pasadena.

Baby Chicks — We have the following varieties of Thoroughbred Baby Chicks every week: White Leghorns, Anconas, R. I. Reds, Fancy Dark R. I. Reds and Barred Rocks. We use only well selected eggs from rigidly culled flocks. BY SPECIAL DELIVERY. This year all chicks are sent by Parcel Post Special Delivery, thus delivering at your door chicks in the best possible condition, and in the shortest length of time. You should send for price list and put your orders in now. Orange County Hatchery, Harold C. Hebard, Prop., Santa Ana, California.

Buy Early Chicks—Early hatched chicks are the best always. They are stronger, much easier to raise than late chicks, mature and lay earlier, develop into larger and better birds. We are now booking orders for early hatched chicks. Do not fail to place your order in time for the early hatches. Several varieties from our own breeding pens. Circular sent upon request. Beresford Poultry Farms, San Mateo, California.

S. C. White Leghorn Baby Chicks from heaviest laying (Hoganized) stock. Safe delivery live vigorous chicks guaranteed. No money in advance; pay on delivery. Prices for May and June $5.00 per 25, $9.00 per 50, $14.00 per 100. Special prices 500 and 1000 lots. Largest electric hatchery in the World. Established 1898. MUST HATCH INCUBATOR COMPANY, 438 Seventh Street, Petaluma, California.

Sly's Old Mission Strain Rhode Island Reds. My customers won highest honors at various California shows last season. See testimonials in new catalogue now ready. Six ideal matings. Hatching eggs at reasonable prices. NO BABY CHICKS. A. G. SLY, 1642 (D) Middleton Place, Los Angeles, California.

Baby Chix—S. C. White Leghorns from open range standard bred parent stock of utmost utility. Protect yourself in having your order booked early. Prices, etc., on application. I. X. L. Hatchery, 519 Upham Street, Petaluma, Sonoma County, California.

S. C. White Leghorn Baby Chicks from my carefully selected, pure-bred stock of S. C. White Leghorns. Orders for spring delivery booked now at $15.00 per 100, $140.00 per 1000. Write for particulars. J. R. Heinrich Poultry Yards, Arroyo Grande, California.

Santa Cruz Chicks — White, Brown and Buff Leghorns, Anconas, Minorcas, Barred Rocks, Reds, Buff Orpingtons, White Rocks and White Wyandottes. Write for 1921 folder with price list. B. W. Archibald, Soquel, Santa Cruz County, California.

Baby Chicks — Barred Plymouth Rocks and Rhode Island Reds in 25, 50 and 100 lots 20c each. Hatching eggs $2 per 15. We ship by Parcel Post, pay all charges. Write for circular. Hargett & Son, Route 2, Compton, California.

Baby Chicks hatched to order from Black, White and Buff Minorcas. Eggs for sale. Also 4 White Minorca Cockerels $5.00 and $10.00 each. Black Cochin Bantam Eggs. Horace W. Crowell, 58 N. Craig Avenue, Pasadena, California.

White Leghorn Chicks from Tancred's 300 egg strain. Write for 1921 price list on all breeds. Am installing electric incubators. Have a few Jubilee and Pioneer to sell at a bargain. Enoch Crews, Seabright, California.

Watch Us Grow—"Quality Chicks." We are now booking orders for the season of 1921. White and Brown Leghorns, R. I. Reds and Barred Rocks. Order early. E. W. Ohlen, Campbell, California.

For Sale — Hoganized White Favorolle with laying records 230-240. Setting of 15 eggs $5 and $10. White Favorolle Poultry Farm, Andres Stammerjohann, Ontario, California.

Light Brahma Eggs for Setting — Stock from University Farm, Davis. $5.00 for 15. Also two cockerels, same stock. Mrs. C. W. Keys, El Monte, California.

Purebred Buff Orpington Eggs $3.00 per setting of 15. Incubator lots to suit. Mrs. M. L. Trewhitt, Route B, Box 47, Hanford, California.

Single Comb Black Leghorns—Combine beauty and utility. Why? Write for circular. Hatching eggs, etc. Fred Turnbull, Box 108, Alameda, California.

Exhibition Quality Reds, trapnested, bred to lay. Write for descriptive circular. Satisfaction guaranteed. T. S. Caldwell, 335 B West Broadway, Glendale, Calif.

Hoganized Rhode Island Red Eggs for hatching, $2.00 for 15 or $10.00 per hundred. Maud Beeching, 1578 W. 46th St., Los Angeles, California.

Baby Chicks—Can book a few more orders S. C. White Leghorns, McFarland strain. Mrs. F. C. Reineking, Inglewood, California.

Partridge Wyandottes, some superfluous cockerels, well matured birds. Mrs. J. L. Dunn, Valley Home, California.

White Plymouth Rocks, eggs and breeding stock. Write for prices. Mrs. B. M. Jesch, Fallon, Nevada.

POULTRY

White Leghorn Hatching Eggs now hatching 75%. Bred for over ten years for vigor and heavy egg production. During high priced season we shipped more eggs to market than any other ranch near. We have more hatching eggs than necessary to fill contract with big hatchery which has taken our eggs for several seasons, which we will sell during March and April in 100 and 1000 lots at $6.00 per 100. No baby chicks. Verity Egg Ranch, 511 West Broadway, Glendale, California.

Trapnested and Line Bred to Lay for seven generations. This is why our pen of S. C. WHITE LEGHORN pullets made such a remarkable record in the state laying contest at Santa Cruz last year. Scientific breeding for increased egg production has been our exclusive business for seven years and we have something to show for it. Correspondence solicited regarding pedigreed breeding stock, chicks or hatching eggs. ENTERPRISE POULTRY RANCH, H. W. Boone, Chino, Calif.

For Sale—10,000 W. L. Baby Chicks every week from California's heaviest layers. Each year some customer reports 200 eggs average in large flocks from our pullets. Lay large eggs from the start. $14.00 per 100, $130.00 per 1000. Rocks and Reds $17.50, Pekin Ducklings 30 cts. We ship everywhere. Free circular. P. Cook Chick Ranch, Alhambra. P. O. Los Angeles. Rt. 8 Box 45.

Baby Chicks—We have 8,000 selected Hoganized hens, all on free range on different ranches, all mated to Tom Barron roosters. We guarantee full count of strong, healthy chicks. Book your orders with us now and avoid disappointment, as orders are coming in fast. 30 years in the business. Lasher's Hatchery, Petaluma, California.

Get Chicks Now and have layers for next winter when eggs are high. Hatches every week. Prompt reliable service. Safe arrival of vigorous chicks from good layers guaranteed. Hatched by electricity. White and Brown Leghorn, R. I. Red, Barred Rock. Reasonable prices. Stubbe Poultry Ranch and Hatchery, Box 67-D, Palo Alto.

We Can Supply You With thoroughbred utility S. C. White Leghorn chicks from heavy layers in 100 or 1,000 lots from Hoganized and trapnested stock. Order now for spring delivery. Write for hatching dates. Forster Brothers, 2918 Otis Street, Berkeley, California.

Baby Chicks — Correctly hatched chicks, from carefully selected hens. Safe delivery guaranteed. White Leghorns, Anconas, Rhode Island Reds, Black Minorcas, and Blue Andalusians. Write for prices. The White Leghorn Hatchery, 951 East Second Street, Pomona, Calif.

White Leghorns—hatching eggs our specialty, produced right, selected right, shipped right. 100 per cent fertility guaranteed. No better stock in the West. Prices very reasonable. No chicks. Curtis White Leghorn Ranch, R. 1 Box 29, Gardena, California.

Chicks — Eggs — Hoganized White Leghorns, Brown and Buff Leghorns, Black Minorcas, Rhode Island Reds, Barred Rocks, Anconas, Blue Andalusians. Free circular. Order early. McDonald Poultry Ranch, King Road, San Jose, Calif.

White Leghorn Baby Chix from heavy-laying HOGANIZED stock. Safe arrival of full count, live, strong chix guaranteed. Price for April, May and June, $14.00 per 100. The Pioneer Hatchery, 409 Sixth Street, Petaluma, California.

S. C. White Leghorn Baby Chicks from our own Bred to Lay Stock. We are now booking for January to July delivery. Our prices are right. Model Poultry Farm, W. C. Smith, Prop., Corning, California.

Baby Chicks hatched from our utility S. C. White Leghorns, a result of many years selecton and breeding for egg production. San Jose Poultry Yards, Fifteenth and Margaret Streets, San Jose, California.

FARM LAND FOR SALE

TEN PER CENT CASH FOR REAL FRUIT LANDS.

10, 20 to 100 acre farms, $375.00 to $450.00 per acre, with abundant cheap water, on terms 10% cash and easy annual installments. Double profits here from products and rapidly increasing values. These lands now sell, this district $2,000 per acre and up, with matured orchards.
EARLIER and BETTER crops because of soil, water and climatic conditions. Three and one-half tons of peaches per acre from three year old trees; seven and one-half tons of apricots per acre from ten year old trees, three-fourths ton walnuts per acre from ten year old trees.
Carloads of trees now being planted by recent buyers, all practical fruit growers. Many well known fruit experts from Orange County, Los Angeles County and Fresno County.
BEST BUY IN CALIFORNIA considering quality and assured increase in value. Close to prosperous town, on borders of splendid lake, State highway and railroad pass through property. Seventy miles from Los Angeles. Many experts believe this will be the highest priced land in Southern California in ten years. Acreage in district is limited. Write for descriptive information prepared by the Elsinore Chamber of Commerce, under supervision of the Elsinore Farm Center, or come to our office. Best crops are walnuts, grape fruit, oranges, peaches, apricots, grapes, olives and alfalfa.
South Elsinore Development Company,
214 Story Bldg., Los Angeles.

For Sale — Foothill poultry ranch; two acres of land; three shares water stock; 465 Tom Barron White Leghorn hens; coop for housing 800. Barn and four room house. Alta Loma, ½ mile N. E. Pacific Electric Station. Mrs. E. K. McKeig, Alta Loma, California.

For Sale—27 acres, plenty water for irrigation, good house, garage and chicken house. Lots of shade trees, good schools, ½ mile from town of Manzanar. For further particulars write owner. Address Box 11, Manzanar, California.

For Sale — 20 acre date garden, ¾ mile Indio. Best date growing section. Coachella Valley. E. A. Miller, Box 192, Indio, California.

For Sale—Beautiful residence lot, clear of incumbrance. Sightly location on High Street, Oakland, California. Address 1342 Sherman Street, San Jose, California.

For Sale — Ranches, Homes, Acres, free list. Wilson Bros., Santa Cruz, California.

For Rent—20 Acres. Will sell 5, no improvements. Cash Nursery, Sebastopol.

TURKEYS

Turkeys — "Goldbank Boy." Champion Giant Bronze young tom. First Prize Cockerel at the New York, Madison Square Garden Show, the premier show of America, with 4311 poultry exhibits, held January 18th to 22nd, 1921, has just been imported by us, arriving at our mountain ranch February 26th. His sire, "Goldbank VIII," was grand champion at the same show, winning first in Cock class. We have mated this young champion bird to a limited number of twenty and twenty-one pound fancy, highly colored, eastern bred hens, also just imported. No eggs of this strain for sale this season at present.
A thirty-six pound yearling son of "Copper King V," the famous thirty-eight pound yearling giant bronze grand champion of the 1919 Madison Square Garden Show, will head our other flock—having mated him to our choice twenty pound hens. Egg prices reasonable. Two young toms of this last strain on hand for immediate delivery. For further particulars address: Bronze King Mountain Farm, Box 308, Calistoga, Napa County, California.

"Points on Successful Turkey Raising"—Our illustrated pamphlet gives benefit of 25 years' experience in turkey raising. It includes: Our method of feeding by which we raised every poult last year, not counting accidents, always raise 90%. Positive cure for blackhead. Plans of the "Stafford Turkey Hatcher"—a great labor saving device. And other valuable things that can be secured from no other source. Price 50c. If convenient, no stamps. R. M. Dodge & Son, Stafford Farm, Route 2, Bakersfield.

J. E. Thorp, Jerseys: Sonny's Benedita, 1,281 pounds milk, 59.59 pounds butterfat; Silver Pearl of M., 788, 50.77.

University of California, Ayrshire grade: Woodland, 1,259 pounds milk, 51.62 pounds butterfat.

University of California, Guernsey grade: Ramona, 2,118 pounds milk, 74.55 pounds butterfat; California Questa Queen, 1,083, 52.09.

R. H. Walrath, grades: Pansy, 1,770 pounds milk, 86.73 pounds butterfat; Minnie, 1,509, 83.01; Guernsey, 1,179, 66.00; Fern, 1,116, 50.10.

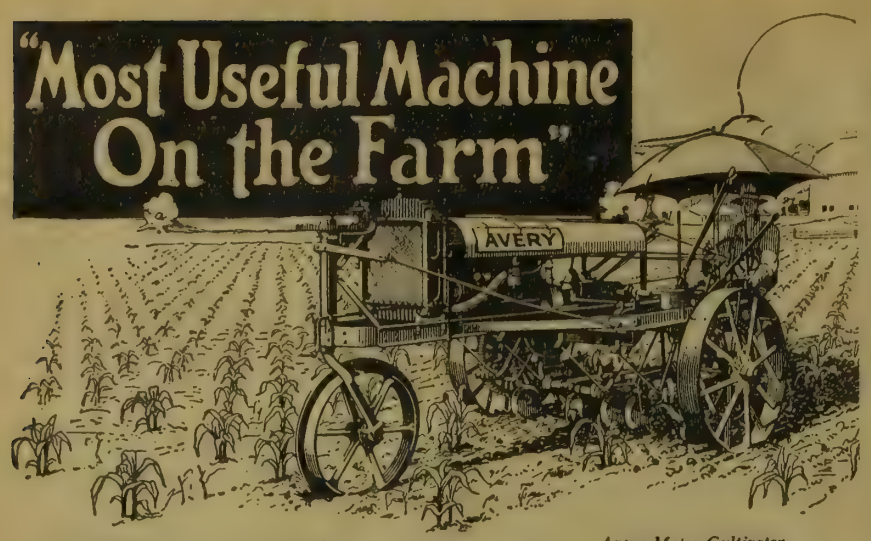
Winsor Ranch, grade J.: Teresa, 1,247 pounds milk, 62.60 pounds butterfat.

The reports for January so far received show that 210 cows in milk during the full month produced an average of 1,275 pounds milk and 5,380 pounds butterfat during the month (average number of days in milk at beginning of month, 88).

The largest production of butterfat for the month was made by the purebred Jersey cow Lady Kate's Rosette, owned by D. F. Conant of Modesto, viz., 101.27 pounds; 4 cows produced

(Continued on Page 373.)

"Most Useful Machine On the Farm"



THIS Avery machine is more than a motor cultivator and more than a tractor. It is, as one owner says, "the most useful machine on the farm."

Not only plants and cultivates all row crops such as corn, cotton, peas, beans, beets, successfully, but also pulls plows, harrows, grain drills, manure spreaders, hay loaders, etc., runs feed grinders, wood sawing outfits, pumps, silo fillers, small threshers and other belt machines. Does all that any small tractor can do, and a whole lot more than is ever expected in a motor cultivator.

Here's the practical machine for all-around work on any size farm. Built in 6-cylinder two-row and 4-cylinder one-row sizes and sold at a surprisingly low price.

Write for the Avery Catalog showing this and other machines in the complete Avery Line, including tractors in nine sizes, tractor plows, harrows, drills, grain-saving threshers, motor trucks, etc.

The new Avery adjusted prices are based upon what materials cost now regardless of what we paid for them. Write for Avery 1921 prices.

Tractors, Trucks, Motor Cultivators, Threshers, Plows, etc.

Wonderful New Hay Crop
SUDAN GRASS

First Introduced into the U. S. in 1909 from the Sudan in Africa. Tests by the department of agriculture have proved it to be of the greatest value in the Southern and Western states, where rainfall is deficient.

Culture—Sudan Grass is strictly an annual. It may be drilled or broadcasted. If drilled 8 to 12 lbs. per acre is ample; for broadcasting 15 to 25 lbs. should be used. It grows 8 to 10 feet high and yields from 3 to 8 tons per acre. You are sure of two cuttings, and if irrigated three or four cuttings.

Sudan Grass for Pasture—During the months of August, September and October all other grasses are dry, then is the time Sudan is most valuable for fall pasture, and by having it fenced in small fields it will yield food for six times as much stock as any other forage will without irrigation. For milk cows and hogs, there is no better and more abundant pasture than Sudan Grass. It will solve the hay proposition as nothing else can or will do in this climate. A good silage and balanced ration. This seed was grown on our own farm, and is free from Johnson Grass.

Price Per Pound:

10 lb. lots, 20c — 250 lb. lots, 12c
100 lb. lots, 15c — 500 lb. lots, 11c
1000 lb. lots, 10c

Proposed Auto License Fees

Assembly bill 945 proposes to repeal all of the old auto laws or laws affecting the passage of vehicles over public highways, also the various and diversified amendments which have been made to them. It provides for control of loads which may be transported over the highways, licensing or issuance of permits to all drivers only when qualified to drive, and a vast number of other regulations. That portion of it affecting the proposed license fees is given in the following table:

MAKE—	Type.	No. pass.	H.P.	Gr. Wt. Veh & Max. Ld.	Present Fee.	Proposed H.P. Fee.	Proposed Wt. Fee.	Proposed Total Fee.

Collecting Wages

If an employer intentionally refuses to pay an employe his wages, will the state labor commission take the matter up free of charge?—Subscriber, Valley Center.

Under one act regulating the payment of wages it is provided that in case an employer shall wilfully fail to pay wages of an employe who is discharged, resigns, or quits, as a penalty therefor, such wages shall continue from the date due at the same rate until paid, provided that it shall not continue for more than 30 days, and any such employer who falsely denies the amount or validity of such wages with intent to annoy, harass, oppress, delay, hinder or defraud the person to whom such indebtedness is due, in addition to any other penalty imposed, may be found guilty of misdemeanor. It is made the duty of the commission of labor statistics and also the district attorney of any county to institute actions for the penalties and to prosecute such actions for violations of the act as may come to their knowledge, and under the general act establishing the bureau of labor statistics it is provided that the commissioner shall have the power and authority, when in his judgment he deems it necessary, to take assignments of wage claims and prosecute actions for the collection thereof for persons who are financially unable to employ counsel, in cases in which, in the judgment of the commissioner, wage claims are valid and enforcible in the courts.

Employer's Liability

What are the workings of the employer's liability act, under which an employe is injured, disabled, or sick, if he is so covered by insurance that his doctor bills and proportion of his wages are paid?—Subscriber, Valley Center.

The employer's liability act defines an employe as "every person in the service of an employer under a contract of hire, rendering actual services, but excluding any person whose employment is casual and not in the course of the business, profession, or occupation of the employer and also excluding any employe engaged in household domestic services, farm, dairy, agricultural, viticultural, labor in stock or poultry raising, or holding appointment as deputy clerk, sheriff or constable." The provisions of the law may be invoked when at the time of the injury the employe is performing services growing out of and incidental to his employment and is acting within the course of his employment and where the injury is proximately caused by the employment, either with or without negligence and is not caused by the intoxication of the employe and is not self-inflicted. Where the injury is caused by the serious and wilful misconduct of the injured employe, the compensation shall be reduced according to various specific provisions; it may also be increased by reason of the serious or wilful misconduct of the employer according to various provisions. If the period of disability does not last longer than seven days from the date employe leaves work as a result of injury, no disability payment shall be recoverable. If the injury causes temporary total disability, 65 per cent of the average weekly earnings shall be paid and in case of temporary partial disability 65 per cent of the weekly loss and wages. For various periods and percentages of disability there are very specific percentages set forth. In order to invoke action it is necessary within 30 days after the appearance of the injury to give notice in writing to the employer of the data concerning the injury, unless the employer has personal knowledge thereof. Thereafter, in case of failure to pay, the applicant may file an application in writing stating the general nature of the controversy with the commission to enforce the act, which is thereafter served upon the employer and a hearing is had before the commission in due course and the commission determines the amount of compensation. In order to enforce payment of its decrees, in the judgment of the commission, it may direct the county clerk to issue a writ of attachment to the sheriff to attach the property of the defendant in an amount not to exceed the greatest probable award. The commission thereafter takes testimony and makes its award, which may be

filed with the county clerk and execution issued thereon. The award may cover a reasonable attorney's fee for services in conducting the matter, a reasonable expense incurred by the employe therein, living expenses, or burial expenses not exceeding $100. This law does not provide any measure for cases of mere sickness or any expenses incident to such sickness, unless the proximate cause of such illness was by reason of the employment. In that case medical, surgical or hosiptal treatment, including nurses, mericines and supplies as are reasonably required to cure or relieve the effects of the injury, may be required to be paid.

Taxes on Orchard

When do I begin to pay taxes upon a newly planted orchard?—Subscriber, Denair.

Fruit and nut bearing trees under the age of four years from the time of planting in orchard form, grapevines under the age of three years from the time of planting in orchard form, and growing crops are exempt from taxation.

Husband Incapacitated

My husband is unconscious. The business is in his name. The hired man cares for the dairy, but there are 11 cows more than he can handle. May I sell or rent them for the season? If I rent them, under what conditions may I do so?—**Subscriber, Cayucos.**

The general provision of the law is that the husband has the management and control of the community and personal property with absolute power of disposition. It would seem that under that provisoin the wife would not have the right to sell or dispose of the community property. In case she does so, the husband could undoubtedly recover the property from the party to whom sold. In many instances both the husband and wife have been held to be agents of the other, but a contract is necessarily prerequisite to any agency and a contract cannot be made with an unconscious person, so that doubtless a sale of the cows would be invalid. There are circumstances in which an agency by necessity arises and it would very probably in the case mentioned be entirely lawful to rent the cows for the season. Care should be taken that a proper compensation be obtained. The provisions of the law, while they may seem rather drastic to the wife, operate in the majority of instances for her protection, as otherwise she, as well as the husband, might be imposed upon in cases such as this where she was not familiar with the value of the property or with business conditions.

DESERT WINDBREAKS

Many windbreaks have been tried in the Imperial and Coachella Valleys but none have proven so effective or so well adapted to the climate as the evergreen Tamarix articulata, a really beautiful tree of 30 feet in height with a shiny blue-green foliage like fine pine needles. It is much superior in general appearance to the deciduous species earlier introduced and it is doubtful if a successful rival will be found for it grows there as though the California desert regions were its native "heath" or habitat. It propagates readily from cuttings of any size and at almost any time of the year. Its extensive planting should be encouraged for its widespread use would prove a great factor in surface wind control.

When pruning has been neglected for a number of years, it is better to extend the rejuvenation over two or three years rather than to do it all in one season.

6% loans to farmers!

The constitutionality of the Federal Farm Loan Act has been confirmed by a decision of the United States Supreme Court.
Loans made by this bank may be paid off any time after five years—and the borrower may enjoy the unusual privilege of taking 33 years to repay his loan in installments.
The loans are made under supervision of the Farm Loan Board—a bureau of the United States Treasury.

IMPORTANT FEATURES

1. No unreasonable limitations or special conditions as to how money borrowed shall be used.
2. The mortgage never becomes due. You pay no renewal expenses.
3. Payments may be extended over a period of 33 years.
4. The land may be sold subject to the mortgage.
5. The borrower pays no commission. We loan *direct* to farmers. Loan made up to 50% of appraised value of the land, and 20% of the insurable improvements.
6. Positively no red tape of any kind.
7. The best and broadest type of service ever extended to farmers.

OFFICERS

A. P. Giannini, President (President, Bank of Italy).
P. C. Hale, Vice-President, (President, Hale Bros., Inc., San Francisco, Oakland and Sacramento).
Jas. A. Bacigalupi, Vice-Pres. (Vice-Pres. and Manager, Trust Dept., Bank of Italy).
A. W. Hendrick, Vice-President (Formerly Sec'y Federal Land Bank, Berkeley, Calif.).
E. C. Aldwell, Sec'y-Treasurer.

The Gasoline of Quality

Red Crown gasoline has well earned the right to be called "The Gasoline of Quality."

Its continuous chain of boiling points insures all of the qualities of a good motor fuel—ready starting, rapid acceleration, and maximum power.

You can get Red Crown gasoline wherever you see the "Red Crown" sign. Look for it on garages and service stations.

What Father Thought An *Expense* Son Makes An *Investment*

A MIDDLE WESTERN FARMER tills the same acreage that he, his brother and father used to farm. And he makes *more* money.

His father used the implements others threw away—unknown makes—for which repairs were hard to get or unobtainable. To him, farm implements were an expense—one to keep small. The son buys *known* tools—the best. He believes that implements to a great extent determine his profits—that implements are an *investment*.

This year farm profits will depend largely on production costs—hence on implements. Before investing, the careful farmer will ask: "Does the tool mean better, faster work—is it dependable and durable?" Sixty-eight years' experience has served to answer these questions correctly in E-B line of farm tools. In these, your investment is protected. Every E-B tool is made to work when needed, to last many years, to lower production costs — facts attested to by farmers everywhere.

Close study of the farmer's needs has taught us *what* to make—sixty-eight years' experience has taught us *how* to make it.

Turnips: Per dozen, 25@30; sack, 90 @1.10.

HONEY

Conditions very unsettled. Market very weak and prices lower. Practically no carlot sales are being made at this time. F. o. b. usual terms, quotations range in 60-lb. cans White Orange Blossom 12½ @13½; White Sage, 12@14; White Alfalfa 9; Light Amber Alfalfa, 6¾@7½; Light Amber, 8½@12; Hawaiian White, 7½; Light Amber, 6. A large percentage of honey shipments are now going out in small containers rather than in the customary case holding two cans of 60-lbs. each. One, five and ten pound glass jars and 2½ lb. individual containers are all being used with a movement which though slow, is better than that on bulk goods. Most shipments are going to Eastern markets to be sold by brokers in less than carlots. Sacked beeswax of good clear color is priced in less than carlots at 33@35 per lb.

HAY

Alfalfa Growers of California report under date of March 8:

Receipts during week were 650 tons.

No. 1 Dairy Alfalfa	21.00
Standard	19.00

Under date of March 5, A. W. Scott Co. says:

Arrivals past week 1,567 tons; preceding week, 650. Trading has been somewhat better, both buyer and seller in apparently better harmony as to value. Consuming demand through the interior has been better; transportation facilities have been good, and in general a very encouraging business has been developing all over the state. Export hay shipment has been quiet.

We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, fancy	20.00@21.00
Wheat Hay, light 5-wire bales	17.00@20.00
Tame Oat Hay, fair to choice	17.00@19.00
Wild Oat Hay	12.00@15.00
Barley Hay	12.00@15.00
Alfalfa Hay	17.00@20.00
Stock Hay	10.00@14.00

Citrus Markets

Los Angeles, March 8, 1921.

The market on oranges is slightly improved. Shipments are running around 200 cars daily.

No more life in the lemon market. Receipts of foreigns are rather more liberal than for several months.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 9,525 cars; lemons, 2,140; total, 11,665. To same date last season: Oranges, 9,275; lemons, 2,009; total, 11,284. From Central California to date, this season: Oranges, 4,290; lemons, 103; total 4,393. To same date last season: Oranges 3,476; lemons, 259; total, 3,735. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total, 283.

STATE DAIRY COMPETITION

(Continued from Page 369.)

over 90 pounds butterfat during January; 12 between 80 and 90 pounds, and 17 between 70 and 80 pounds.

The California Cultivator prize for January was won a second time by Los Angeles County Farm at Hondo, for an average production by five grade cows of 78.45 pounds of butterfat (ranges, 65.1 to 86.3 pounds; credit, 86.33 pounds). Other groups of five grades eligible to compete for this prize produced on the average as follows: Earl Graham of Compton, 71.91 pounds. (credit 82.05 pounds); Adohr Stock Farms, Van Nuys, 67.57 pounds (credit 71.02 pounds); F. F. Pellissier, Whittier, 65.67 pounds; R. H. Walrath, El Centro, 64.01 pounds; Napa State Hospital, 62.34 pounds; S. G. Gambonini, Petaluma, 50.07 pounds (credit 51.48 pounds); C. E. Fisher, Hughson, 45.09 (credit 51.67 pounds); University Dairy, Berkeley, 41.75 pounds (credit 46.22 pounds); J. M. Christen, Pacheco, 41.70 pounds (credit 45.81 pounds).

Cows may still be entered in the competition during the month of March. Entries close April first, 1921. Information concerning the competition, regarding rules, prizes offered, etc., as well as entry blanks will be furnished upon application to Professor F. W. Woll, superintendent of dairy tests, University Farm, Davis, California.

MEN WANTED

Information free worth $100 to car owners.

If you are a worker, reliable, would represent a line that hundreds of your friends and townspeople must buy regularly, or would establish yourself in a permanent, lucrative business requiring little capital, in home town, we may help you. Your earnings will be satisfactory from the start. Possibilities are enormous. Address Manufacturer, Dept. C C, Nu-No-Skd Co., 213 Mercantile Place, Los Angeles, Calif.

THE GREAT OLYMPIC FEED MILL

The Wonderful Attractions of BRITISH COLUMBIA

Few countries possess all the conditions for happy, prosperous living as does British Columbia. The varieties of climate and soil offer inducements for almost every branch of agriculture. Whether in the warm interior valleys, the rich grazing table lands or the fruitful lowlands of the Coast or Vancouver Island, the advantages offered for

Dairying, Fruit Growing and Stock Raising

are such as must appeal to those who wish to improve their circumstances and at the same time live in a country of delightful climate, magnificent scenery, varied resources, progressive people and abundance of opportunity for development. British Columbia—the playground of America—is already famous for the production of its orchards, fields and dairies. Now, is the time to **Learn about this wonderful Province** and share in its possibilities. It's industrial life—mining, lumbering, fishing, manufacturing, transportation—assures a ready market at good prices for all the farmer can produce. Schools, churches, railways, roads, telephones, all the conveniences of an old land await you in this new Province of Opportunity and Success. For illustrated literature, maps, etc., write Department of Immigration, Ottawa, Can., or

Canadian Government Agent.

Ups and Downs

Manager Barber of the Poultry Producers of Central California writes:

"Egg prices have been quite erratic lately, following the 'jumpy' course of the Eastern market. Owing to the continued mild weather throughout the country the production of Western and Southern eggs has continued to increase. Receipts at New York for the week ending January 29 were 87,584 cases, which was 50 per cent more than the same week last year. Chinese, Japanese, Argentine and Australian eggs added to the supply. Pacific Coast white eggs were also arriving in large quantities. The entire market, therefore, developed great weakness, and between January 27 and 31 the price of white eggs in New York dropped 9 cents. Our market followed suit with a drop of 8 cents in the same time, from 51 to 43 cents.

"New York then remained steady at 57 to 61 for several days and San Francisco stiffened a little in sympathy with it, but Eastern supplies continued to increase faster than consumption, causing an accumulation which on February 4 started a series of breaks on successive days, until on February 9 New York was down to 42 cents (highest quotation on whites), a total drop of 19 cents in five days. Our market necessarily followed, getting down to 31½ on February 9.

"During a period like this, of rapid fall in prices, everyone limits his purchases, buying just what he needs from day to day, in the expectation of still lower prices. Therefore, both jobbers and retailers carry very little stock, so that when the consumptive demand, stimulated by the lower prices, begins to increase rapidly, they are forced to buy heavily to supply it. This causes a reaction, as we have just seen when New York prices jumped up again 16 cents in two days, reaching 58 cents for whites yesterday (February 11). The San Francisco market also advanced, but more sparingly, as New York dealers were still cautious about taking on further supplies.

"It is rather too early to tell anything about the price of eggs for storage in the East and we have not yet information enough on production to venture any opinion. We hear reports that spring production in the Middle West will be much larger than last year. If so, this will be the controlling factor in determining prices of eggs for storage. April futures (storage packed eggs for delivery in April) sold on the Chicago Exchange 42 cents a month ago.

"There are many uncertainties about the outlook. The spring conventions of egg shippers at St. Louis and other centers will undoubtedly shed much light on the situation."

POULTRYMAN'S CALENDAR—MARCH, THE BROODING MONTH

Probably there are more chicks in brooders in March here in California than in any other month. Every chick that is to be hatched ought to be out of the shell before the first of April, and the February chicks make wonderful growth during March if only they are intelligently cared for. Keep them warm, but not too warm. Feed them plenty of good, clean, wholesome feed. Get them into the fresh air and onto the ground just as soon as possible. Chicks that are brooded by hens are in the open most of the day by the end of the first week. Brooder chicks should have just as much air and just as much exercise as hen brooded chicks. Work them off the chick grain as quickly as possible. Chicks that have wheat before them from the start prefer it to chick feed by the time they are ten days to two weeks old. Above all, keep them clean. Lice, mites, filth, mold, all menace the life of the little chick.

Two Cents and Better Above the Market

The Poultry Producers of Southern California, Inc., is sending letter to members from which we quote:

"So much misinformation, if not actual misrepresentation, regarding the affairs of the Poultry Producers of Southern California, Inc., has been freely circulated of late that the writer feels a few first hand facts as to what has been accomplished during the past year might be welcomed by our members.

"When these results are before one in concrete figures there can be but one conclusion and that is that our members' loyalty to their organization has brought results of which they should be proud and which promise well for the future.

"Of course, it is impossible to state what the local market would have been with no cooperative organization in the field, hence we can only compare ours with a similar nearby market, that of San Francisco, and as the latter is influenced by the Poultry Producers of Central California, Inc., the result is a striking uniformity, when taken for the entire year.

"Using the official market quotations from day to day and dividing by the total number of market days, we get as the average market price on extras for the entire year 55.91 cents for San Francisco and 55.84 cents for Los Angeles, these prices including cases. Using monthly averages, Los Angeles was highest in May, June, August, October, November and December; and San Francisco in January, February, March, April and July, while in September the two markets were the same.

"Some of you may say: 'I am not interested in what the market may be, but in what I get for my eggs,' forgetting for the time being that you are interested in the market, for that absolutely governs what you receive for your product. However, let us see what you did receive for your eggs in actual money every week, with not even a single remittance a day late during the entire 52 weeks.

"Taking the monthly averages of the pool prices, as used on our statements, we find the average for the year on extras was 55.90 cents. Now, this is without cases, so to see what your management received for all eggs sold we add 2 cents and obtain 57.90 cents as the average selling price for the year as against a market average of 55.84 cents, or 2.06 cents above the market."

NOTES FROM PRESIDENT DAVISON'S ANNUAL ADDRESS

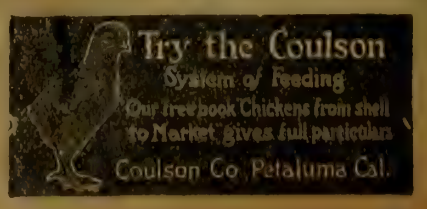
Fellow Members of Poultry Producers of Southern California, Inc.: We have just passed our fourth milestone.

Last year our local production had so far passed our local consumption that we had some 150 cars to ship to outside markets.

During 1920 our organization marketed 4,103,444 dozens of eggs for 710 members, the total volume handled for the year being $2,096,450.37.

During the year we stored 1,470,000 dozens of eggs, of which 684,900 dozens were stored for the account of the association.

During the year just closed 920 cars of California eggs found their way to eastern markets. Our association contributed 120 cars of these. The number of eggs which we shipped to New York during the year represents 35



Try the Coulson
System of Feeding
Our free book Chickens from shell to Market gives full particulars
Coulson Co., Petaluma Cal.

per cent of our total sales for the year.

Total paid-in capital stock of the association on December 31, 1920, was $88,591.08. This means that our total authorized capital of $100,000 will be paid within a very short time.

The proceeds of the association's annual pool aggregated $20,517.22, mailed during the current week. This means that each member of the association who marketed eggs through the association in 1920 had returned to him through the annual pool an amount equal to one-half cent per dozen for every dozen of eggs so marketed.

PROTECTION NEEDED

With eggs from the Orient reaching the American markets, literally by shiploads, poultrymen must realize that unless they can secure an adequate tariff on imported eggs the industry faces a serious setback. Your organization, in connection with the Poultry Producers of Central California, Inc., and the Petaluma Chamber of Commerce, has had a representative in Washington since early in January in an endeavor to have eggs included in the Fordney emergency tariff bill, but so far without success. It now seems unlikely that this bill will become a law, but the work we have already done should help in securing a permanent tariff on eggs at the next session. However, we cannot relax our efforts in this direction, and we urge all poultrymen to see to it that their local poultry associations forward proper resolutions to their senators and congressmen.—Cornele G. Ross, Chairman Executive Committee Poultry Producers of Southern California, Inc.

Poultry Queries

Conducted by J. A. Koethen

Purple Combs

Some of my hens have purple combs. When I opened one that died I found the eggs in her as hard as if they had been boiled, but her liver was perfectly healthy. Another hen died last night.—Subscriber, Lankershim.

That one hen may have had inflammation of the oviduct, but it is hardly likely that the rest of the flock have it. The purple combs indicate some sort of liver trouble due to too heavy feeding, especially of corn and barley. The liver may be only slightly enlarged or perhaps not enlarged at all. It may be smaller than normal or congested with blood or marbled or spotted, but a spotted liver more often indicates tuberculosis than liver trouble. It is in the spring when the birds have been heavily fed for several months that liver trouble is most likely to show itself, and the treatment is always the same, a lighter ration with more green feed and if possible more exercise. You do not mention your ration, so I can only suggest that you add a considerable amount (half is not too much with most mashes) of bran to the mash, drop barley altogether as well as milo and other forms of corn, making your scratch feed wheat and oats. You will not need to continue this indefinitely, but a change will do the hens a lot of good. And do not feed too heavily even of wheat. A quart a day to 15 hens is ample. Keep green feed before them all the time if possible. Too much grain, especially the fattening grains, and too little greens is one of the most prolific causes of digestive troubles. You might also give a dose of Epsom salts all round, allowing one-half teaspoon to each hen. Dissolve in water and mix in a small quantity of wet mash. Give this once a week for several weeks.

Soft Shelled Eggs

Why do our hens lay soft shelled eggs? They have charcoal, grit, eastern oyster shell and slaked lime before them, lots of green feed and egg mash, but many of them continue to lay soft shelled eggs. They are quite fat. One we killed last week had three eggs in her oviduct—one was broken, one was rotten and one was good. What was the cause?—Subscriber, Lathrop.

If your hens are very fat that explains both the soft shells and the unlaid eggs. A very fat hen can neither manufacture shells for her eggs nor lay them after they are manufactured. You do not mention the breed. If they are Rocks or Orpingtons or any other of the heavier breeds, you might as well send them to market before the price drops. If they are Rhode Island Reds or Wyandottes you may be able to reduce them by omitting corn in every form (milo, Gyp corn, maize) and barley from their ration. Possibly a diet of wheat, oats and green feed will reduce them if you do not feed too much, but as a rule a fat hen is of more use on the table than anywhere else.

THE POLITICAL GRIND

"I have observed," said the friend, "that whenever the caller who has just departed visits anybody he has an axe to grind."

"Well," replied Senator Sorghum, "we ought to be willing to contribute if possible, to the worthy enterprise of others. I don't object to a man who has an axe to grind, if he honestly means to go out and chop wood with it. What I do object to is the politician who merely desires to whet a tomahawk."—Washington Star.

The Kresky Brooder Stove

When writing advertisers, mention the Cultivator.

THERE'S a reason for everything. Nothing ever "just happens." My success with poultry is not an accident or a matter of "luck"—here are the three reasons my hens pay:

The FIRST reason:

My success begins with the baby chick. I start them on the right feed, and in that period when baby chicks so easily sicken and die, the pure dry buttermilk in Globe "A-1" Baby Chick Mash, and the fine balance of ground grain, grain hearts and meatine, builds them to vigorous youngsters, makes them grow, and acts as a safeguard against disease.

The SECOND reason:

My growing chicks are well fed. Experience has taught me not to "stint the ration and stunt the bird." During the stage of rapid growth, when the making of bone, muscle, flesh and feathers demand feeds high in protein, Globe "A-1" Growing Mash **(containing Dry Buttermilk)** brings them to maturity as strong, healthy birds ready and fit to lay.

The THIRD reason:

I know that it takes feed to make eggs—and so I feed an egg ration—Globe "A-1" Laying Mash **(containing Dry Buttermilk)**.

Same Stock-but Better Results

There are two ways to get more from your live stock. One is to increase the NUMBER of animals. The other—the better way—is to make each animal YOU NOW OWN do better. The latter is the safer, the more profitable method. It is "intensive cultivation" applied to live stock.

Pratts Animal Regulator

is compounded for one purpose—to make poor stock good—to make good stock better. And for nearly fifty years "Pratts," America's original stock tonic and conditioner, has been doing this work—doing it WELL.

Pratts Animal Regulator is a real builder and preserver of health and strength. It helps to put live stock in such perfect physical condition that best results are SURE to follow.

FOR—Greater strength and endurance from your work animals—
Increased flow of milk from your cows—
Healthy, vigorous young from your breeding stock—
Rapid and healthy growth from your young stock—

USE PRATTS ANIMAL REGULATOR

Our Money-Back Guarantee protects you

Pratts Dip and Disinfectant

is a big help, too. By killing disease germs and skin parasites, and by keeping stables and pens in sanitary condition, it protects the health and promotes the comfort of live stock. That means but one thing—better results—*bigger profits.*

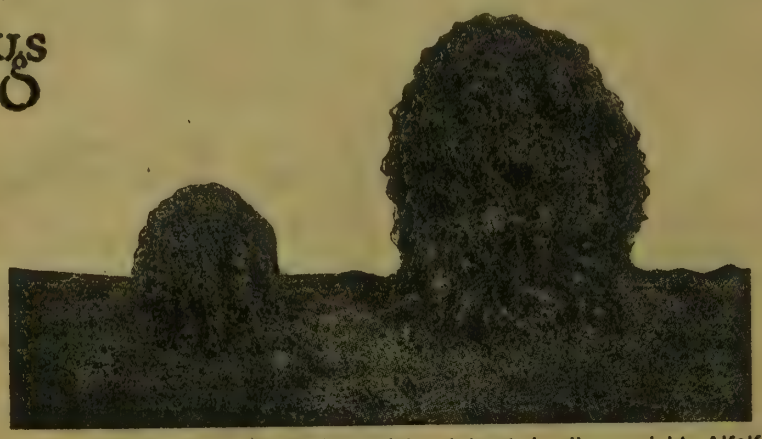
Turn Low Priced AGRI GYPSUM Into High Priced Crops

Hundreds of Farmers in California, the Northwest, and in other sections, have increased their crops from 50 to 1000 per cent. by the application of Gypsum. Figure it out for yourself. By increasing an alfalfa crop of three tons to the acre fifty per cent you increase the per acre value on a $25.00 a ton basis from $75.00 per acre to $112.50 per acre. But as a rule the average increase in alfalfa yield where AGRI GYPSUM is applied is around 400 per cent. On such a basis, twelve tons at $25.00 is $300.00 instead of three tons at $25.00 or $75.00, an increase of $225.00 per acre by the use of AGRI GYPSUM, at an expense so low that it amounts to practically nothing as compared to the profit derived. And AGRI GYPSUM need not be used every year. Usually an application of about 1000 pounds per acre will provide ample sulphur for any leguminous crop for two seasons. For citrus crops heavier applications of AGRI are recommended.



Pile on left shows Alfalfa from plot not treated; pile on right, Alfalfa from same size plot treated with 200 lbs. of gypsum to the acre. Photograph loaned by Professor Olson of the State Experiment Station of the State of Washington.

What AGRI GYPSUM Does:

Numerous authoritative tests have shown that AGRI GYPSUM has increased the yield of alfalfa from 50 to 1000 per cent. A California user of AGRI GYPSUM in Tulare County writes that "the benefits derived have been excellent in every case, and especially on the heavy foothill soils." He used 200 tons.

An Orange County user writes that the use of AGRI GYPSUM resulted in a large crop of oranges, a cover crop averaging an increase of from three to six tons per acre heavier, and a very noticeable benefit to the condition of the soil.

Chas. B. Lipman, University of California, Circular No. 111, says: "Gypsum may be used to a good advantage on alfalfa fields to stimulate the growth of the plants. This is especially to be remembered in connection with alfalfa fields of several years' standing in which bald spots or bare patches are found. An application of Gypsum in such cases will give striking stimulation to the plants and rejuvenate the field. Gypsum is a stimulant to the alfalfa plant itself and to the nitrogen gathering bacteria which grow in thenodules on its roots."

Other crops requiring large amounts of sulphur and which have shown remarkably increased production by the use of AGRI GYPSUM include beets, beans, peas, cabbage, vetch, melilotus, onions, potatoes, peppers, lawn grass, barley, grapes, berries and many others.

Alfalfa, beans, peas and practically all the great protein makers require much sulphur. Also they are great calcium lovers. AGRI GYPSUM is calcium sulphate. It is most easily and economically applied by using AGRI GYPSUM. If you do not use it you are not obtaining maximum results.

For the purpose of determining the amount of alkali in soils we will make a free chemical analysis, advising the correct amount of AGRI GYPSUM to apply.

New AGRI Booklet Just Out

United States Gypsum Co.,
904 Citizens Nat'l Bank Bldg.,
Los Angeles, Calif.

Gentlemen: Please send me a copy of your new booklet giving full information about "AGRI."

My Name .....

My Address .....

There are many places in California, Washington and Oregon where Gypsum will return twenty-five to fifty times its cost when applied to alfalfa. You owe it to yourself to investigate. Run tests on a small area **this year** to see what effect AGRI GYPSUM will have upon **your soil.**

Dr. R. R. Snowden, one of the foremost authorities in California on soils and fertilizers, says: "The agricultural world is experiencing a vivid awakening to the need of sulphur in many if not most soils. Some crops such as the legumes and the mustard family require more sulphur than others, yet all must have it. Gypsum is therefore a most important fertilizer for its sulphur content as well as for its lime and its beneficial effects in a number of other respects. By neutralizing black alkali it is useful in reclaiming alkali land, often rendering it productive where nothing would grow before and raising the surface to the normal level."

You can tell any field where AGRI GYPSUM has been used. The plant growth tells the story. Many recent experiments by recognized authorities show almost amazing increases in crop production.

Considering costs of nitrates, phosphates and other crop producing elements, you can save money by alternating fertilizer with AGRI GYPSUM and obtain equally good, if not better, results at a saving to you and benefit to your land.

Gypsum contains two of ten essential elements for plant nutrition,—calcium and sulphur, and also serves to release other elements. It is not new. It was introduced in Europe in 1768. Benjamin Franklin was the first to advocate its use in America, and soil experts everywhere advocate its use in the production of the principal crops.

Ask your Dealer for AGRI GYPSUM and you will be sure of the product ground fine to do the most good with the least amount used. If your Dealer cannot supply you, write

Los Angeles — An Illustrated Weekly for the Rural Home and Ranch — San Francisco

Vol. LVI — March 19, 1921 — No. 12

Planning and Planting a Vineyard---Planting

By Fred K. Howard

ALL of the matters leading up to the planting of the vineyard have been quite fully discussed by the writer in previous issues of the Cultivator, and it is presumed that the prospective grower who has followed this series has given the different matters presented very serious consideration and is consequently in a position to properly plant the land which he has prepared to the desired varieties.

One of the most important matters to consider before the planting is actually started is the location of avenues. This is equally important regardless of the kind of grapes planted. It is necessary to haul picking boxes in to the pickers and haul the fruit out when growing table grapes, and it is equally necessary to handle the trays and sweat boxes if raisins are grown.

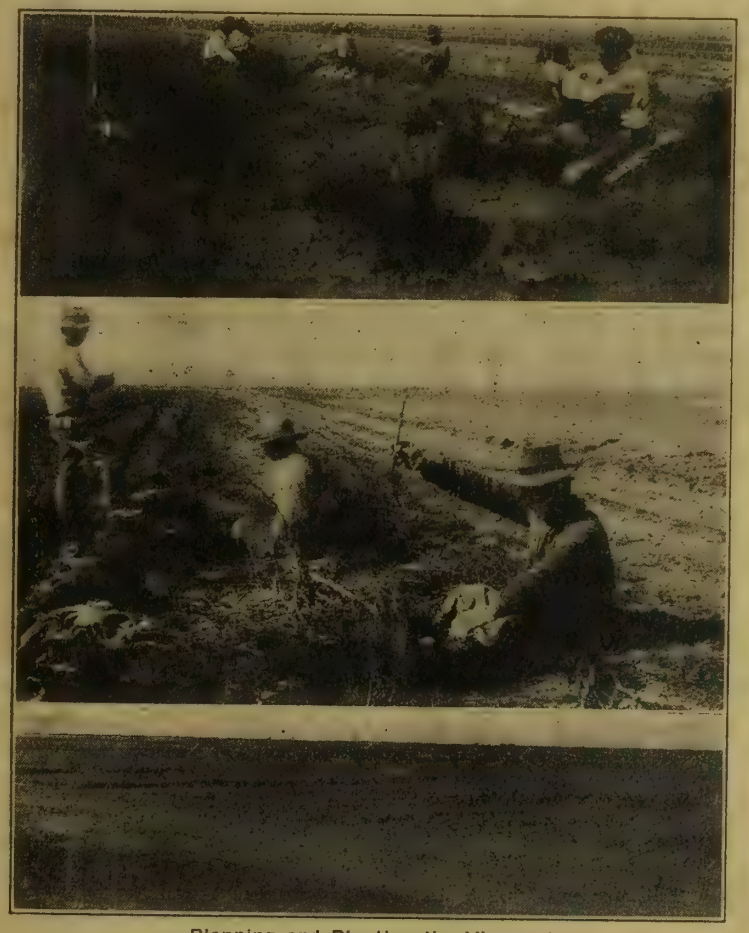
The number of avenues necessary depends somewhat on the size and arrangement of the vineyard, but it may safely be said that the blocks should in no case be larger than ten acres. Five acre blocks may be desirable in some cases.

After the general arrangement has been decided upon and the location of the irrigation ditches determined, the actual laying out of the vineyard should be done. But here we arrive at still another very important problem, that of the proper distance to plant. For the raisin varieties the wide rows should as a rule run east and west to permit more rapid drying. This is particularly essential with the raisin Muscat. This is a late ripening variety and must have every advantage or the drying may be delayed until the early rains begin. Like arguments may be made in the planting of the Thompson Seedless. It is possible that the lay of the land is such that the proper fall for irrigation water cannot be obtained either to the east or west, and with the trellised varieties like the Thompson or the Sultana it is very difficult or practically impossible to irrigate crosswise. In such cases it may be permissible to run the rows north and south. It is probably far better to have the rows this way and be able to irrigate and secure a profitable crop every year, risking the danger of loss by slow drying, than it would to have east and west rows with ideal drying conditions and be unable to apply sufficient water to produce crops.

In late years the tendency has been to give the vines more room, and the usual planting distance for the Thompson and the Sultana has been either seven or eight by twelve. In some districts plantings have been made as close as four feet apart in the rows, the idea of the grower in these cases being that when the vines got so large that they were crowding he could remove every other one. By this method it is figured that the early returns from the vineyard will be considerably greater than when planted in the usual manner. The problem with this method, however, is whether the grower will have the nerve to remove half of his vines early enough to prevent crowding.

The table grapes may be planted on the square system or with avenues. Some of the common distances in use during the past few years have been ten by ten, nine by nine, and eight by ten. Here again it is possible, and perhaps desirable, to plant twice as many in the row to secure larger crops during the early life of the vineyard.

When the general plan of the vineyard and the distance between vines has been finally decided, the next step is to lay out the vineyard, and it is probably best that a surveyor or someone competent to do the work correctly be employed for this purpose. It must be remembered that a vineyard properly cared for will produce fruit in paying quantities for a lifetime, and any errors in the planning and execution of the plan will come back more forcibly every year. The old slogan, "Be sure you are right, then go ahead," should be in force at this time by all means. Have the surveyor locate the base line and set stakes indicating the position of each row. Then run another row of stakes down the other side of the block or as far away as your planting line will reach and parallel to the base line. When this has been carefully done you are about ready to plant the vines.



Planning and Planting the Vineyard

Upper picture shows men at work pruning the young vines before planting. Center: Rooted vines properly pruned and ready for planting. Lower: This vineyard just planted. Note how straight the rows run.—Photos by Fred K. Howard.

The Planting Line

One of the greatest labor savers in vineyard planting is the use of the planting line. Perhaps the best material for this purpose is an ordinary twisted wire clothes line. At intervals along this line a button of solder should be placed to indicate where the vine is to be planted. If the vines are to be planted eight feet apart in the row then these buttons should be exactly eight feet apart. Some planters use a piece of red cloth clamped down between the strands of the line instead of the button of solder.

On each end of the line a stout iron ring should be soldered and some long iron stakes for the proper anchoring of the ends provided. When ready for planting this wire is stretched between the stakes, indicating the position of the rows, and firmly anchored, making sure that clods of dirt are not forcing any part of the wire out of line.

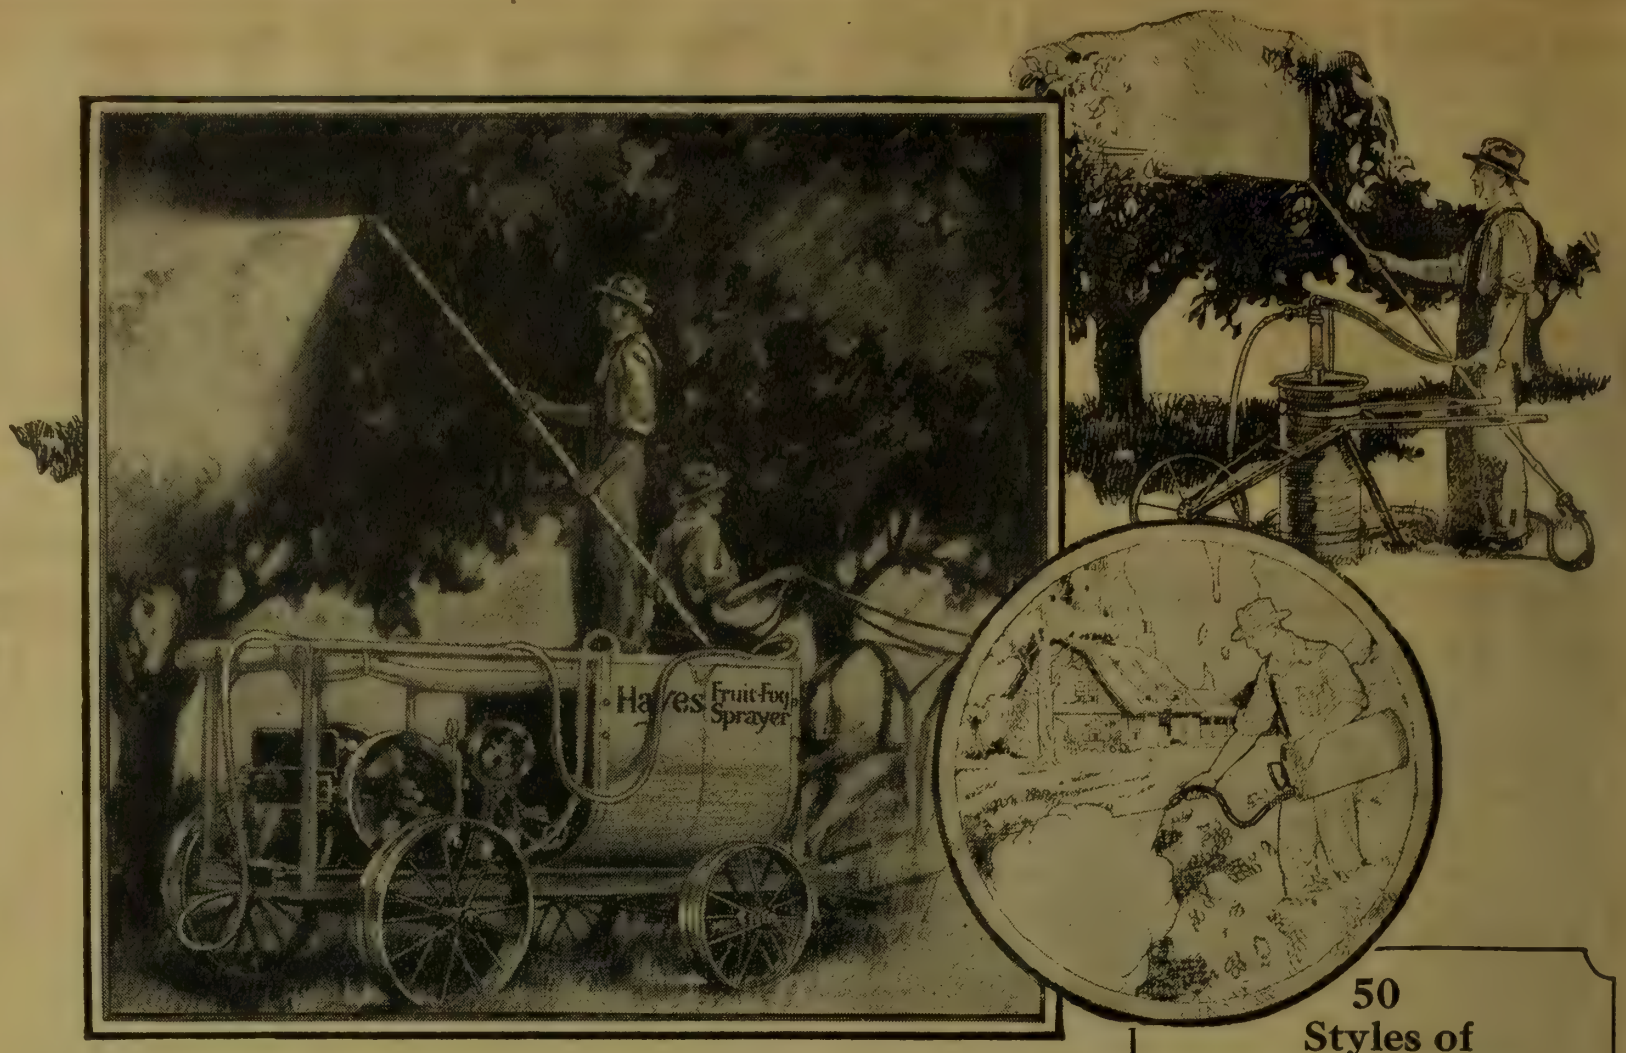
Preparation of the Rootings

Before planting it is advisable that the rooted vines be pruned properly. This means that all of the top should be removed except about two buds on the strongest growing shoot, and all of the roots except those growing from the bottom node. Even these roots should be shortened to four inches or less, and all of the roots which are crowding or have a tendency to twist should be pruned out. When this has been done the vines are ready to plant. It must be remembered at all times that these plants are very tender and should not be left exposed for any length of time. When taking the rootings into the field for planting they should be protected with wet burlap or be carried in a bucket with the roots covered with water.

Plant With a Shovel

The old practice of planting with a bar should not be used. While it is true that hundreds of acres of vineyard have been planted in this manner it cannot be said that they have

(Continued on Page 386.)



Are Farm Pests Costing YOU Fortunes?

For years government experts have said, "Kill the millions of destructive pests and fortunes will be added to farm profits each year."

Today thousands of farmers and fruit growers offer enthusiastic proof that the terrific losses from life-sapping, profit-stealing pests *can be prevented* by Fruit-Fog, the vaporous, high-pressure superspray.

Farmers and fruit growers ought to send the coupon and learn all about famous Fruit-Fog spraying. Learn why, for example, *only* a vapory fog-like spray can penetrate into the microscopic niches in bark, buds and foliage—where millions of tiny UNSEEN pests hide—and where no coarse, heavy, low pressure spray can possibly reach.

Our new FREE book explains how Fruit-Fog is produced by Hayes 300 lb. high pressure and the famous Hayes nozzle. How it is scientifically atomized—why it envelops everything like a mist, does an absolutely *thorough* job, and has wonderful adhering power. No drops form—no solution wasted—no buds or leaves knocked off—as with coarse, heavy, low pressure sprays.

Hayes Fruit-Fog Sprayers are skillfully made to give enduring service and greatest efficiency under high pressure. The famous Fairbanks-Morse "Z" Engine assures reliable engine service.

Send Coupon Today

Tell us what you want your sprayer to do, and we will tell you the style best suited to your needs, and its price. We will also send our new Sprayer Book and Valuable Spray Guide FREE.

Send the Coupon Today.

HAYES PUMP & PLANTER CO., Dept. D., GALVA, ILL.

50 Styles of Hayes Sprayers

Hayes Hand Bucket Spray Pump
Hayes Fruit-Fog Gun
Hayes Compressed Air Hand Sprayer
Hayes Hand Barrel Spray Pump
Hayes Platform Duplex Hand Sprayer
Hayes
Hayes High Pressure Triplex Power Sprayer

Hayes Pump & Planter Co.,
Dept. D, Galva, Ill.

Please send FREE and without obligation your Big New Book of Hayes Sprayers and your Valuable Spraying Guide.

California Cultivator

Vol. LVI, No. 12 Los Angeles, March 19, 1921 One Dollar Yearly

More Than the Traffic Will Bear

A THOROUGHLY established principle of transportation —at least in California—as expressed by a pioneer Californian, is "All the traffic will bear." That principle has been established by years of actual practice. Now comes an "advance" step and "More than the traffic will bear" seems to be today's slogan. At least the railways, with the consent of the interstate commerce commission, are today making a rate on lemons which has caused an average loss on every box shipped from California during the past year of $1, yet railways refuse to consider the seriousness of the situation and give only "emergency relief."

Oranges are likewise in the hole, and an effort is being made to have the rate reduced from $1.92 to at least $1.25 per box, the lemon rate from $1.67 to $1.10. Formal announcement that the railways refuse to consider this has been received by the Exchange. President C. C. Teague gives expression to the seriousness of the situation in the following words:

By C. C. Teague

It is becoming more apparent each day that the advances of, first 25 per cent and then 33 1/3 per cent in the freight rates have put a burden on the heavy tonnage producing fresh fruit and vegetable business of the Pacific Coast that is more than the traffic can bear.

Because of the increased operating costs of the railroads, due to increases in cost of labor and materials, these advances were authorized to be put into effect by the interstate commerce commission.

Before that time railroad rates were built up on the basis of what the traffic could bear—it being recognized that to sustain the railroads a large tonnage of freight was necessary—and the policy of the railroad rate experts was to encourage heavy tonnage producing industries by establishing freight rates that would allow those industries to grow and expand so as to produce an ever increasing volume of freight.

Formerly rates were established that were low enough to encourage the planting of vast areas to citrus and deciduous fruit orchards and vegetables. These industries have grown tremendously until now they are the most important industries on the Pacific Coast and the general prosperity of California and the other Coast states will rise or fall with the prosperity of these industries. This will be recognized when it is understood that California's annual shipments aggregate 60,000 carloads of citrus fruits, 43,000 carloads of deciduous fruits and 50,000 carloads of vegetables and cantaloupes, and that a total of 205,000 cars of these commodities are shipped annually from the Pacific Coast.

It will be recognized that this business of 205,000 carloads is an important factor in the revenues of the western railroads. The present freight rates do not leave these industries sufficient returns to pay the expenses of production, and if the fresh fruit and vegetable business is to be maintained, these rates must be reduced. If the rates are not reduced this tonnage and revenue to the carriers will rapidly fall off, as producers cannot long operate at a loss.

Proper consideration was not given to the effect of these percentage increases on industries located so far from the great consuming markets of the East. Freight represents a much greater percentage of the selling value of these commodities than it does on commodities produced closer to those markets. Nor is there evidence of careful consideration, on the part of the carriers, of how much more serious these advances are to the producer, on a cost per acre basis, in the industries producing high tonnages per acre than in those producing low tonnage agricultural products.

The injustice and inequality of these advances since June, 1918, is illustrated by the fact that they amount to from $150 to $250 per acre to the orange, lemon and apple grower, while in the case of commodities producing low tonnages per acre, they aggregate only from $10 to $30 per acre.

The amount of these advances, capitalized at seven per cent, is equivalent to the placing of mortgages on the fresh fruit and vegetable producer of from $1,000 to $3,000 per acre, depending on the productiveness of his property. In other words, if the interstate commerce commission and the railroads allow these rates to stand, they will destroy a large part of the value of the fresh fruit properties of the Pacific Coast. The present selling value of these orchard and farm properties is not equal to the mortgage that, by reason of these advances in freight rates, has been put on them.

It is a well known fact that increased costs of labor or freight on perishable products, unlike manufactured products, cannot be added to the selling price and passed on to the consumer, as they are distributed in accordance with the law of supply and demand through a great many agencies in active competition with each other, a large proportion being sold at public auction. Consequently these increased freight charges must be absorbed by the producer.

It requires from eight to ten years to bring an orchard into bearing. It is, therefore, of greatest importance that these rates be immediately reduced before producers, through discouragement and inability to pay expenses, generally neglect or abandon their orchards.

The advances in freight rates, instead of producing more revenue, as they were intended to do, will eliminate tonnage. The effect will be the opposite of that intended. The diminished revenue will cripple the railroads to the extent that these industries are allowed to be crippled.

I have given a great deal of thought to the effect of these advanced freight rates upon these heavy tonnage producing industries and without a reduction of freight rates the condition of these industries to me seems absolutely hopeless.

The Top Working of Lemon Orchards

By C. S. Milliken

MANY lemon growers at the present time are considering the advisability of going out of the lemon business.

This past year has been unprofitable and the prospects for improved conditions are not as bright as one might wish. California is at present producing from her 33,000 acres of bearing lemon trees enough fruit to supply the United States even if no Sicilian lemons are imported. In addition to the 33,000 acres of bearing trees there are 17,000 acres of young trees which are not yet in bearing. Most of this young acreage has been planted in well chosen locations.

The marketing difficulties of this season look like simply the beginning of still greater difficulties ahead and it seems evident that some people are going out of the lemon business whether they wish to or not. The next few years will help to sort out the orchards which are producing a good tonnage at the right time of year from the poorly producing orchards and those which throw the bulk of their crop at a time of year when it is difficult to market it to advantage. If a grower is convinced that his orchard will fall in the latter group it is economy to cease lemon growing promptly rather than to wait and be forced out of business by a series of painful years.

The man who wishes to change his lemon orchard into another variety of citrus can either pull up the lemon trees and replant or he can top-work the lemons to the variety of orange or grapefruit desired. There are advantages and disadvantages in each of these methods of solving the problem. By replanting one has the decided advantage of being able to choose well grown trees budded from record parents. With a new start one can start right. A new start, however, means a loss of time because a bearing orchard can be secured much quicker by top-working the lemon orchard than by pulling up these trees, which it has taken several years to grow, and starting all over again. Record performance budwood can be used in top-working so that one can be as sure of obtaining the right strain by this method as by replanting.

It seems clear, however, after an examination of many orchards which were worked over from lemons to oranges in times past, that it is not desirable to try to top-work a lemon orchard unless the trees are in good healthy condition and unless the work can be done by competent men who understand the business.

There are many productive orange groves today which have lemon trunks; groves which were top-worked from lemons to Navels or Valencias 16 or 20 years ago. Some of these groves have averaged from seven to ten field boxes per tree for several years past, and these orchards are good in appearance; they are healthy and productive.

Nevertheless, there are many orchards of this kind which have gone backward and are at present in poor condition. These are more numerous in some districts than in others. In the foothill districts results have been better than on the lower ground. In general, orange trees with lemon trunks withstand adverse climatic conditions less well than orange trees on their own trunks. For this reason it seems to the writer better to replant a young lemon orchard than to top-work it. If the lemon trees are, on the other hand, several years old, are healthy trees and well located, the experience of the past shows that they can be top-worked to oranges with the assurance of obtaining a good orchard.

The budding can be done at any time when the bark separates easily from the wood; when the bark is "slipping." Most of the budding of this kind is done in the spring and early summer; some of it in the fall. It is already in progress this season, having been begun in some districts about the middle of March.

One of two methods is followed. The buds are inserted either into the old bark or else the trees are cut back, sprouts allowed to grow and the buds are placed under the new bark of the sprouts.

In the first method the first step is the pruning out of the tree around the main branches so that the budder can have working room. Usually the buds are placed in the main limbs a foot or so from the point where these leave the trunk. Of necessity they are placed on convex portions of the limb, usually near the under side, because in the hollows and on the inside of the limb the bark does not slip freely. It is desirable in cutting the bud from the bud stick to cut a long shield and then after the bud is placed to wrap it tightly so that it will be held firmly in contact with the cambium layer of the tree.

No step in the technique of top-working old trees is so important as tight wrapping. In budding nursery stock the bark is thin and pliable and offers little resistance when wrapped, but in old trees the thick bark is springy and unless care is exercised the inserted bud will rest so loosely

(Continued on Page 386.)

Agricultural News Notes of the Pacific Coast

Northern California

Alturas County is making heavy shipments of cattle to San Francisco.

Bee keepers of Butte County are urging appointment of a county bee inspector.

The acreage planted to olives in this state has been doubled within the past ten years.

Many of the melons grown near Orland, Glenn County, are marketed in Portland, Oregon.

Carload shipments of eggs to New York are going forward daily from the Petaluma district.

Dairymen of Butte County are considering organization of a cow testing unit in the farm bureau.

Center meetings of the Tehama County farm bureau will be held at Los Molinos, March 28; Liberal, 29; Bowman, 31.

Turkey shipments are still being made to San Fracisco and Los Angeles markets from the Willows district of Glenn County.

The marketing department of the Plumas County farm bureau has purchased a large amount of sulphur for the use of members.

Butte County home demonstration meetings will be held at Gridley Colony, March 19, morning; Rio Bonito, March 19, afternoon.

Rice growers at Biggs, Butte County, say that they will plant practically the same acreage this year as last in spite of the discouraging year.

A general meeting of those interested in the formation of an organization of producers of dehydrated fruits was held in San Francisco on March 8.

March meetings of the Glenn County farm bureau will be held at Larkin, 25; board of directors meeting at Willows, 26; Elk Grove, 28; Grapevine, 30.

Antioch, Contra Costa County, shipped out its first carload of asparagus the last week of February. That section expects to ship this season about 125 cars.

Strawberry plant growers of Castella, Shasta County, have formed an organization. Most of the plants are sold to growers in the Watsonville section.

Antioch, Contra Costa County, expects to ship 125 carloads of asparagus this season. Shipments of asparagus from the state in 1920 totaled 490 cars.

The Modoc development board is asking that several road units in Alturas County be made state roads so as to make available state and federal funds.

A class of 60 candidates has just been initiated into the Sebastopol grange. During the drive conducted by the grange for new members 150 have been secured. The membership now is 225.

Dr. H. S. Fawcett and D. Camp of the citrus experiment station at Riverside have been carrying on citrus blast investigations during the past month in the R. P. McCune orange grove at Wyandotte.

A farm center has been organized at Hagginwood, Sacramento County, with H. G. Baugh as president; W. E. Van Guilder, vice-president; N. H. Robotham, secretary; Charles L. Gilmore, J. D. Wheat, Mrs. C. Hodges and Carl Brusso, membership committee.

Central California

The proposed merger of the Danish Creamery with the San Joaquin Valley Milk Producers is off.

One hundred and forty carloads of olives have already been shipped from Lindsay, Tulare County.

The Tulare County Cattlemen's Association held its annual meeting in Porterville, February 26.

The Stanislaus County Fair Association has decided that it would be impracticable to hold a fair this year.

The world's largest raisin pie has been made by the California Associated Raisin Company for exhibit purposes.

Grain growers of the Corcoran section of Kings County recently met to consider cost of erecting grain elevator at that point.

Reorganization of the San Joaquin Valley Milk Producers officially became effective March 1. Ed H. Webster is general manager.

The Peach and Fig Growers Association is planning to extend use of those fruits through cooking schools in many sections of the country.

The Stanislaus Growers Association has elected officers for the coming year: N. S. Amerine, president; G. N. Pfarr, secretary-treasurer.

The Madera County Fair and Livestock Association and the Merced County Breeders Association are outlining a plan for uniting in a district fair.

Two new plants of the San Joaquin Valley Milk Producers were opened March 1; one at Caruthers in Fresno County, the others at Madera in Madera County.

Assistant Manager Dezell of the California Fruit Growers declares that approximately 4000 carloads of lemons may be shipped via the Panama Canal the coming year.

Rice growers of the San Joaquin Valley met at Claus in Stanislaus County, March 2, and formed an association. Frank Hart of Claus was elected temporary president.

Immediate erection of a grain elevator at Ducor, Tulare County, is planned by the elevator division of the state farm bureau. Later it is hoped to locate two others in the county.

Farm home department meetings in Kern County will be held at Shafter, March 21; Weed Patch, 22; Rio Bravo, 23; Inyo-Kern, 25; Kern Delta, 29; Wasco, 31; Edison-Fairfax, April 1.

Reorganization of the Stanislaus County Purebred Holstein Calf Club with 50 members is planned by a committee of the Stanislaus County Holstein Breeders Association and Assistant County Agent McCallum.

A mass meeting of orange growers of the Lindsay district was held recently, attended by over 750 growers. A committee of ten was appointed to formulate some definite plan for organization and to secure affiliation of other growers of the valley.

Wage reductions for sheepherders and shearing work have been announced by the San Joaquin Valley unit of the California Woolgrowers Association. The maximum monthly wage for sheepherders is $70 as against $90 paid last season. The price for shearing has been placed at 10 cents per head for hand shearing, and 13 cents for spring shearing.

Southern California

Covina is organizing a cooperative fumigation association.

Ontario is testing out the basket shipping plan with oranges.

Farm bureaus of the southern part of the state are discussing a decrease of 25 per cent in wage scale.

Arrests of truck drivers are being made in Ventura County for driving overloads on the highways.

Imperial Valley growers of grapefruit are said to be receiving a net price this year of $2.25 per box.

The Escondido Fruit Growers Association is sending out carload shipments of oranges to Eastern points.

Owners of trees in Victor Valley in which mistletoe is growing are urged to cut it all out before leaves open.

The onion acreage of the Coachella is practically cut in half over last year's planting, according to estimates of some growers.

Orange County citrus people are discussing cooperative ownership of ships to carry orchard products to Eastern seaboard.

Citrus growers of Orange County are appealing for pre-cooling plant at Newport. This in order to encourage ocean going shipments of fruit from that port.

The Arlington Heights Citrus Association of Riverside County last week shipped by water one car of lemons to Boston, one to Charleston, one to London.

A carload of oranges in bushel containers was sent to Denver recently. There were 500 baskets in the lot, it is estimated, at a saving of 25 to 30 cents a box.

Water shipments of vegetables are being made to New York from the port of Los Angeles at the rate of 65 cents per hundred as compared with the rail rate of $1.66½.

The dam at Lake Hemet is to be raised ten feet The proposition is also being considered of diverting to the lake the waters of Strawberry Creek and raising the dam another 15 feet.

Twenty-six hundred carloads of lettuce is the present estimate of shipments from Imperial Valley. Except for the heavy increase in freight rates there would have been something over 3000.

In the Riverside County Cow Testing Association's work for February 387 cows were tested. The high honor winner for the association was a Holstein owned by N. L. Browning of Hemet, which produced 74.04 pounds fat.

The citrus by-products plant at Corona is saving money for lemon and orange growers in the manufacture of citric acid and other high priced materials from cull oranges and lemons. At present it has a problem in disposal of large amount of waste waters.

Assessor Hopkins of Los Angeles County has announced that there will be a material reduction in valuation of lemon trees in the tax assessment of 1921-22. Orange County will likewise make reduction of 25 per cent. There was an increase last year of 100 per cent. In that county valuations have been running from $350 to $500 per acre. San Bernardino County valuations have been around $250 and are now to be cut to $150.

The Coast and General

Yuma County, Arizona, sold $600,000 worth of its highway bonds on March 4.

Marion County, Oregon, will spend this year $600,000 in improvement of roads.

American corn is being sold in Chihuahua, Mexico, for the first time in five or six years.

The Lewis County (Washington) farm bureau tested 1738 cows for tuberculosis during 1920.

The Cherry Growers Union of The Dalles, Oregon, is planning to build a warehouse and storage house.

Warmer weather and slow soaking rains in Southern Arizona have improved conditions on the ranges.

Because of lack of rains on ranges of western New Mexico cattle are overgrazing the lands near water holes.

The Pomona grange of Douglas County, Oregon, has elected F. A. Goff, Melrose, master; C. H. Bailey, South Creek, secretary.

Banks of Klamath County, Oregon, have agreed to finance buyers of purebred stock at the second annual sale of the Klamath County farm bureau.

Flying time from San Diego to Jacksonville, Florida, 22 hours, 32 minutes. This record was made by Lieutenant Coney in continuous flight 2,090 miles from Pacific to Atlantic.

Fruit growers of the Wenatchee Vallay of Washington are making whirlwind campaign to contract 4000 carloads of the 1921 crop in a new cooperative marketing association.

The Clatsop County Fruit Growers Association was recently organized at Astoria, Oregon. J. S. Dellinger of Astoria was chosen president and W. E. Schimpff, Clatsop, secretary.

The Idaho and Washington Wheat Growers Association has undertaken to sign up 25 per cent of the 1921 crop of Idaho, Oregon and Washington in the National Association of Wheat Growers.

Unseasonably warm weather in the plateau region of Arizona has started growth, and fears are entertained that fruit trees in the valley sections of the north will be started sufficiently to be injured by late frosts which are almost certain to come.

In view of the reduced acreage of long staple cotton in Arizona for the season of 1921, and the extreme care in selecting seed from last year's crop, it is believed that there will be a sufficient amount of pure seed from high producing fields to plant the entire crop from selected seed.

A new policy of assessing the grazing fees on national forests has been announced, which it is expected will be more equitable than the present system. The new plan will endeavor to guard against overcharging stockmen and at the same time protect the rights of the government.

A representative of the United States immigration department has been sent to the Salt River Valley of Arizona to inspect the living conditions of Mexicans brought from Old Mexico for cotton picking. Although no official report has been made, it seems certain that the general condition of cotton picking families had been reported to the department as far more serious than the actual facts would warrant.

The Use of Gas Tight Fumigation Covers

By H. J. Quayle and Hugh Knight

ANY discussion of gas tight fumigation covers is not new; it is as old as the fumigation process itself. The importance of having a cover that would hold more of the gas has been appreciated from the beginning, but all attempts to make practical gas tight covers have heretofore failed and their use has been discouraged rather than otherwise. Possibly we are not much farther along today, but the division of entomology of the citrus experiment station proposes to stay with the matter long enough to find out just what can or cannot be done in respect to the use of gas tight tents. It is not consistent with American ingenuity or resourcefulness in productive capacity not to meet the needs of urgent demand, and the chief reason for presenting this discussion at this time is to create the demand, particularly as based upon statements of more than a year's experience in the field with a gas tight cover.

To hold a definite amount of gas for a definite period of time is the very basis of the whole fumigation problem; it is the fundamental requirement of any sound fumigation procedure, and it can be met only by the use of gas tight covers. Standardization of fumigation is impossible so long as wholesale and variable leakage of gas occurs through the tent. With our present tents more than half of the charge given to a tree is, in effect, shot into the air to no purpose whatsoever so far as the results are concerned. If the amount of leakage were constant, even though it be large, more uniform results would follow, but the escape of gas through the tent is as variable as the weather itself. The securing of better and more uniform results on the scales, at the same time insuring greater safety to the tree, represents the greatest improvements possible in fumigation practice, and our results indicate that such improvements are effected by the gas tight tent system.

Field Tests

The senior author has been more or less actively engaged in work on gas tight tents since 1914. The first tents used consisted of the ordinary canvas treated with various substances as well as especially constructed fabrics. Since 1919 gas tight fumigation tents have constituted one of our major problems. Through the courtesy and interest of Sergeant E. R. Boland of the Arcadia Balloon School we have had the privilege of using a gas tight tent at various places in the field during the past year. The use of this tent has made it possible to determine just what may be expected from gas tight tents, and, even if the system should meet with practical commercial difficulties, the work has justified itself in the information secured bearing upon the general fumigation problem through the elimination of the variable factor of leakage.

With the use of gas tight covers the dosage for small trees may be reduced two-thirds, for average sized trees one-half, and for large trees one-fourth, making an average for all trees of a reduction of about 50 per cent of the schedules now in use. Moreover, with this reduction in dosage the period of exposure may also be reduced to about 30 minutes to effect the same—or better—results as are now secured with canvas tents. The dosage may be increased and the time decreased, or vice versa, within certain limits without affecting the result. In other words, the percent of dosage multiplied by the time gives a constant the use of which has enabled us to better standardize fumigation work. For example a 50 per cent dosage multiplied by the time, 30 minutes, gives a constant of 1500. And so long as this constant is maintained like results are secured. For practical purposes we have found that the minimum dosage, except for very small trees, is a 33 1-3 per cent dosage, while the minimum time is 15 minutes. That is, much less than a 33 1-3 per cent dosage does not give a killing concentration of the gas and 15 minutes is as short a time as a practical maximum dosage (100 to 200 per cent) may be held. A 50 per cent dosage for 30 minutes, giving a constant of 1500, or a 33 1-3 per cent dosage for 45 minutes, giving the same constant, 150, will give similar results. See other variations in the table below.

This table shows different dosages and exposures which when multiplied together give the same constant; and so long as the constant is the same the same fumigation results may be expected with gas tight covers:

Dosage Pct.	Exposure Minutes	Constant
33 1-3	45	1500
50	30	1500
100	15	1500
33 1-3	90	3000
50	60	3000
60	50	3000
200	15	3000
100	50	5000

The last line in the table, 100 per cent dosage for 50 minutes, giving a constant of 5000, represents what now takes place with canvas tents. But most of the gas has escaped through the tent long before the end of the 50-minute period so that the 5000 constant doesn't mean much. However, when the tents become damp or wet and practically gas tight we have a constant that is entirely too high for safety, and thus certain cases of injury are accounted for.

For ordinary fumigation work in most localities the work thus far indicates that a constant of about 1500 is about right But one of the purposes in resorting to a gas tight tent was to see if we could not secure satisfactory results on the resistant red scale at Corona and on the resistant black scale at Charter Oak. Under such conditions it has been found necessary to raise the constant to 3000 and at this point the scales can be satisfactorily killed. The work in Orange County recently has shown that good results on the black scale in nearly all stages can be effected with a constant of 1500, that is, 50 per cent dosage for 30 minutes. In one of the groves in Orange County black scale were abundant in all stages, many in the egg stage even on the fruit. When we need a constant of 2000, that is, a 50 per cent dosage for 40 minutes, or any higher constant, there has been practically a complete kill of all stages. So satisfactory has been the kill there even in the egg stage that a competent observer has stated that without reinfestation from adjoining trees the grove would go two years before fumigation would be again necessary. A 100 per cent kill has been secured on the red scale at Corona (constant 3000), and such a kill is known to be very rare in that territory.

The writers wish to acknowledge the generous assistance given by G. B. Winner of the American Cyanamid Company during a portion of the season's work.

Practical Considerations

It is fully realized that the most important question to be met in any work leading to the general adoption of a gas tight tent system of fumigation is the production of a tent that will meet all the requirements for commercial work. Our own work during the past year has been largely with a tent made especially for us through the kindness of Mr. Boland. This tent consists of balloon cloth, which, on account of its expense, can scarcely be expected to be adopted for general work, but otherwise it has been quite satisfactory. We have interested several companies in the production of gas tight tents. For the past couple of months we have been using a cover in the field made by the Goodyear Tire and Rubber Company of Los Angeles. This is a rubberized cloth that gives considerable promise, and we have confidence that this tent or some modification of it will be produced by such a company that will prove to be commercially satisfactory. Great credit is due to George Hockensmith, manager factory aeronautics of the above company, for his active cooperation and the persistence of his efforts toward the production of a satisfactory gas tight cover. We have also been able recently, through the courtesy of the Standard Textiles Company, to make tests in the field with another type of tent.

When a practical gas tight tent is produced its cost will necessarily be higher than that of canvas tents. At present the average cost of the hydrocyanic acid per tree is about 20 cents. If gas tight covers save one-half of the gas the saving will amount to 10 cents per tree; and if there are 800 trees covered in a season by each cover (8 trees per night for 100 nights) the saving in cost of hydrocyanic acid will be $80 a season for each tent in use. Under such a system the cover charge will need to be increased. But there is no object in advocating a reduction in the cost here and an increase there, were it not for the great superiority of gas tight tents and the belief that eventually there will be a reduction in cost to the grower. Gas tight tents may be somewhat heavier, so that the labor cost of pulling the tents may be higher. However, the tight tent that already looks good is practically the same weight as an eight ounce United States army tent. With the use of gas tight tents it is most important that the tents be well kicked in and made to lie in close contact with the ground.

There has been some discussion about the increased danger to operators with the use of gas tight covers. It is true that there is more gas under the tent when it is removed from the tree; but what is the purpose of fumigation? It does not involve the use of a cover that will allow the greatest escape of gas. On the other hand one of the dangers at present is that the man operating the atomizer is obliged to breathe the gas that escapes through the canvas. With gas tight covers the generator is safe and he can stay close by the tent long enough

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

The cover this week is given over to a most intensely practical suggestion, or several of them, as to method of planning and planting a vineyard. California has shipped thousands of cars of grapes every year for many years, and it has even been suggested that we have reached the limit of consumption. But still the cry is for more, and last season's output was handled at satisfactory prices. Plant grapes and then more grapes, but let them be of the table or raisin varieties best adapted to the section.

* * *

When one comes in from a hard day behind the plow or cultivator there is real rest in looking at some of the exquisite photographs of California's waterfalls or shady nooks. The waterfalls will be at their best this summer, especially in the early part of the season. Plan a trip to the mountains, and it is none too early to do the planning.

* * *

Here is the opening section of Assembly Bill 148:

"It shall be unlawful for any bank, trust company, corporation or individual other than one duly admitted to practice as an attorney at law under the laws of the state of California, to engage in the practice of law or to render or give any service or advice or information concerning any matter of law, or in connection with the making or preparation of wills, trusts or the probating or distribution of estates of deceased persons, or in connection with estates of minors, incompetents or insane persons, or making of deeds, grants or contracts in connection with the making of wills, trusts or grants of real estate for any compensation or consideration." In other words, California shall hereafter be of the lawyers, by the lawyers and for the lawyers. In addition there is Senate Bill No. 21, which makes it a misdemeanor for "any person not licensed as an attorney * * * to render or furnish legal advice or services or in any manner to assume to be entitled to practice law, etc." The senate bill may possibly have some redeeming feature in that it might lessen the number of pettifoggers who are endeavoring to befuddle our courts, but, as worded, the bill would practically prevent a neighbor from informing another as to the plainest facts of law.

* * *

Last spring we went to a goat dairy upon the hillside in La Crescenta owned by J. B. McLaughlin and afterwards referred to the wonderful short time performance of the tiny dairy animals, especially to the production of Rosemont's Polly-Mac. Her maximum was 15.4 pounds milk for 24 hours or 452.6 pounds in one month. She was at that time starting on her annual official test and we suggested possibilities of her equaling the great production of California Gretel who produced 2,941.5 pounds milk in 365 days at the university farm. Now comes a letter from Mr. McLaughlin, from which we will quote more largely next week, but at least as a hint: "On the 18th day of February, 1921, Rosemont's Polly-Mac, No. 1263, A. M. G. R. A., completed her 12 months' test under the official supervision of U. C., making a record of 4,350 pounds of milk, thereby excelling California Gretel's record by more than 1,400 pounds." The possibility of writing sentences like that means more to the goat dairy industry than all the phrases filled with praise which we could write.

* * *

IT RAINED

A forty-eight hour rain has saved the day. It began Saturday and continued until Monday morning. This time it favored somewhat the southern end of the state. Heretofore this season the North has been given by far the greatest precipitation. In various southern sections the storm resulted in a precipitation of from somewhat less than an inch to 4.3, most sections, however, running around two inches. In northern sections the total precipitation was from one to two inches, but this on top of the former heavy rains makes for a magnificent season.

THE TRAGEDY OF THE LEMON

The losses suffered by the wheat grower of the East and the Middle West, the disaster confronting the wool and mutton producer of the range country, even the economic conditions confronting the cotton and rice growers of the South and Southwest do not compare with the tragedy of the lemon.

For six or eight years the grower has been living on the savings of other days and bringing into bearing a lemon orchard. Each year has brought him that much closer to an independence and to return for his long waiting and hard work—and instead of return he faces ruin.

The worst of it is that while the livestock producer, the cotton, the rice grower and other producers of food staples realize that they may have an opportunity in the future to recover, the lemon grower, on the other hand, at the present moment is faced by a situation that could hardly be darker.

The Upland Lemon Growers Association members express it in this way:

"Do you realize that we have 20,000 acres more lemon trees planted in California than is needed to supply all the fresh lemons consumed in the United States, and that unless we find some other market besides the fresh lemon market we must pull out, bud over, or destroy at least that amount of our lemon groves? Twenty thousand acres of lemon trees means seven or eight years of the business career of the three or four thousand owners thereof. It means the loss of $50,000,000, including, in a great many cases, the savings of a life time."

But the members are not entirely hopeless, for while they look at the failure of the effort made to secure recognition of the industry by the national congress and the administration, they still feel the new administration and congress may realize the situation and afford relief, this not simply through protection by tariff on the fruit but also on such by-products as citric acid and oil. Quoting again a letter from the association, "disaster can be avoided by the levying of an adequate protective tariff on lemon products, meaning citric acid and lemon oil. Is there any reason why the duty on the manufactured products of a ton of lemons should not be as great or greater than the tariff on a ton of fresh lemons?"

Lemon growers are a plucky bunch, but they are rapidly approaching a situation where even pluck makes impossible longer existence of the industry unless some relief is secured.

MORE COOPERATION

The suggestion in the center of this page, written by Franklin K. Lane, is particularly pat at this moment. Genuine cooperation is not easy to secure on the part of all the people.

It appeals to us that it is especially to be desired at this moment. While California is still the greatest oil producing state of the Union warning is given that the time must come when our supply of oil must be reduced and we must look elsewhere for power and light. The only way we seem to be able to turn is toward the mountains. There is in them promise of abundance, but we must work to claim the promise. In other words, there must be more of reclamation, or storage and conservation. Thus far all agree. But how? And here we begin to scatter.

A plan has been suggested as to conservation and distribution, known as the Marshall plan, and because of this and other suggestions, a bill is presented to the state legislature calling for an appropriation to provide for investigation as to the state's water power possibilities. This is no sooner done than engineers gather, engineers who admit that they are much wiser and have not been consulted, and suggest that the Marshall plan is without merit. Likewise comes the geological survey with statement that it in no way endorses any plan for conserving water for use in California valleys or developing power for use on farm and in factory. But why this contention at the very inception of a great movement?

The big interests which have secured valuable privileges may be responsible for some of the effort now being made to discourage investigation. We hope not, but if they are, they should be assured by the mass of the people that their proper rights shall be protected and at the same time the proper rights of the people demanded.

It is possible, also, that too much personality is being injected into this effort at the development of the state. In the first place it is not a movement to honor or memorialize one man, for this reason is there not a possible error in making so much use of "Marshall?" There can be no plan big enough to meet California's needs which is simply one man's plan. It is an opportunity for cooperation of the biggest brains in our country. If any one of these men is more responsible than another for the great accomplishment for which we are hoping, our children's children will know it without any effort on our part to fix in advance the honor. If we must have catch words or rallying cry, let us combine on "California cooperation" or some similarly impersonal expression which may unite us all.

Note the last sentence in Mr. Lane's address, "Cooperation is the next big move in business affairs." And California is one big business affair.

Quoting again from Mr. Lane:

"Calling things by nice names, popular, alluring names, does not solve problems. Nevertheless, such names evidence our social dreams. We all feel there must be more of justice in the economic world, but we don't want it at the expense of society—that is at our own expense—for that means bolshevism, and bolshevism is paralysis.

"The basis of everything must be production and distribution of the economic necessities of our life. If the farmer was forced, for lack of a potato cellar, to use up his potato crop as he took it from the ground, we would have a feast at one time and famine at another."

HOLD YOUR BREATH UNDER WATER

Many of us in contemplating our immediate problems overlook the promises of the future. A slack time is always one of fear, never of confidence, and no great policies should be adopted in such an atmosphere. For the man who can afford to take the long view these are great days. He can take up now what others cannot carry. Better still, he can prepare for the demands of tomorrow. He can find more oil or develop more water power, if you please, and plan for their fuller uses. The same principle applies to everything.

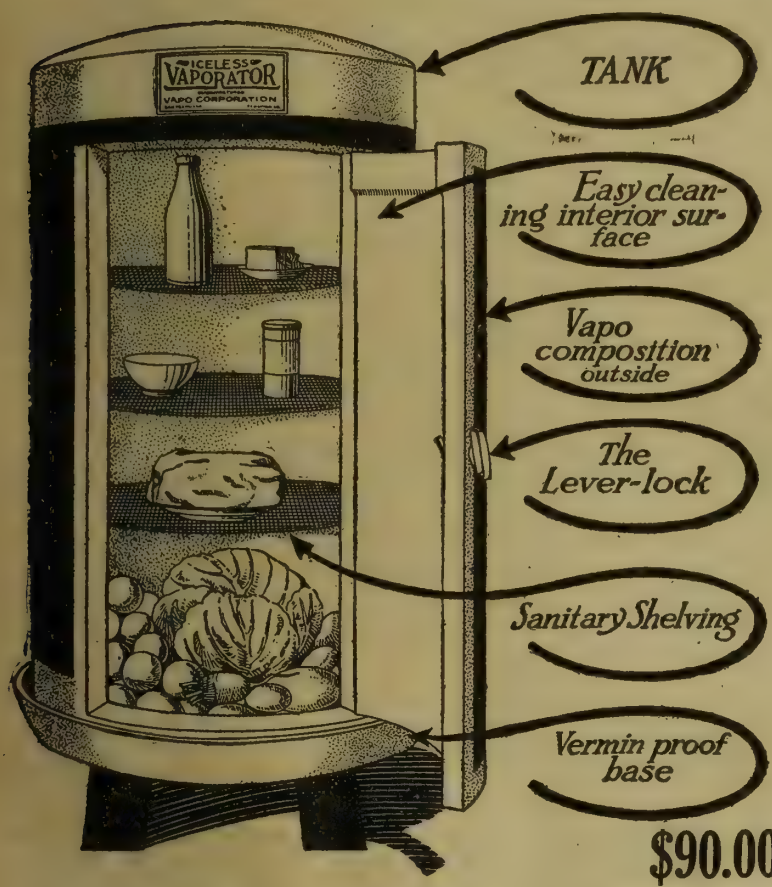
Right now the call in national affairs is for vision. We have use for the men who can see this nation in its relation to other nations next year and next generation, and for men in business who can think in terms of 1922 and 1925 and 1945, as the power companies in California are now doing. That is what really big business can do—hold its breath under water.

The fault lies in the fact that we do not fully cooperate in the solution of our difficulties, and cooperation is the word of this century. We do not even know what the word means yet. We work together most imperfectly in things political, and we are only just beginning to feel our way into the realms of cooperation as far as social and industrial life are concerned.

So far, the only people who have done much in the way of substantial thinking as to cooperative action—collective action—are those who think in terms of immediate and large fortunes for themselves through capitalizing combined brains and money. Their example is a good one to follow where the object is not great wealth, but is a more even measure of good living for all the people—insurance is the right word for it, business life insurance—through honest cooperation. YOU MARK MY WORD THAT IS THE NEXT BIG MOVE IN BUSINESS AFFAIRS.—Franklin K. Lane.

Simplicity

A simple sanitary cooling plant that carries no expense after the original investment



$90.00

The Iceless Vaporator stands 5 feet high. Diameter, 28 inches.

Food Chamber is 43 inches high. Diameter of Food Chamber is 24 inches (so you see what a goodly quantity of food stuffs finds place in the Iceless Vaporator).

The dimensions of the door accommodate milk pans of the largest size.

The constant circulation of air is achieved by such cautious screening of openings that the Iceless Vaporator is dirt-proof and proof against ants, insects, anything that either creeps, crawls or flies.

All these wise provisions are set forth in the booklet *"Refrigeration Without Ice"* which we shall hasten to mail to you if you will send us your address.

TO DEALERS

There will be one Vaporator dealer in each town. Behind him will be put a forceful advertising campaign. Write for agency.

WATER COSTS LITTLE

You fill the tank at the top. Under ordinary circumstances, that will last two or three days. The water permeates the sponge-like outer wall. When filled, it will not absorb more until evaporation takes place.

Evaporation cools the outer wall, the air space between, the inner wall, and the contents of the food chamber within. No ice is required. No dirt or insects can enter. It lasts forever.

The hard, white surface within is easily cleaned. The galvanized wire shelves are sanitary and permit the circulation of air.

The food is preserved at an even temperature, thus keeping it fresh and sweet. The pressure clasp-lock forces the door tight, to keep out the heat and keep in the cool. The Vapo composition of which the

ICELESS VAPORATOR

is made, is virtually a stone sponge. It is a patented material of long life and forever-serving qualities. Once installed, the Iceless Vaporator becomes a family friend for all time.

Ask your dealer about the Iceless Vaporator, or write us direct.

Pears in Antelope Valley

Wild lands in the valley are generally covered with sages and other shrubs which must be uprooted and burned. A smoother is then run over the land to correct minor inequalities of grade, though the surface is practically level. Pears appear to thrive in a great variety of soils, but in this valley the best are the clay loams and the sandy loams free from alkali.

Until a few years ago none but Bartletts were planted but it was found that cross pollination brought increased yield and now many Winter Nelis are used for this purpose, planted every fourth, fifth or sixth row, according to whim of planter. The young trees are generally headed back at planting to 18 or 20 inches high. They are immediately irrigated and then whitewashed to prevent sunburn. The planting is generally done in January and February. Irrigations during summer are given from two to four weeks apart, depending on character of soil and weather conditions, and winter irrigation is practiced when rains are insufficient, for pear trees need a goodly and constant supply of soil moisture. At least one cultivation is given after each irrigation.

Barnyard manure is generally the only fertilizer used when a sufficient supply is available, but some commercial material is found necessary, especially on the older orchards. The manure is applied in the fall and the commercial in early spring. Pears in the Antelope Valley are not much troubled with insect pests or diseases. An occasional attack of blight is easily eliminated by an immediate pruning, and timely spraying removes the codlin moth if any is found. At present there are about 5000 acres in pears, 2000 of which are in full bearing, and it is expected the present spring planting will total 1,000 acres. During 1920 there were shipped 144 carloads, and prices received were very satisfactory.—E. B.

Pruning Pears at Palmdale

Horticultural Inspector Pegler demonstrating the long pruning method in a young orchard.

CHEMICAL WEED KILLERS

By A. Layman

The killing of weeds is something like getting rich; there seems to be no easy or royal road, at least not for the mass of us. We have heard of cases where application of arsenic solutions or of kerosene or of sulphate of copper or other poison substance "completely eradicated" morning glory or other pestiferous weed. The same remedy in the hands of others under different conditions failed dismally. Geo. P. Gray, chief of the division of chemistry of the California department of agriculture, has given much time and made thorough investigation of destruction of weeds by chemicals. These investigations were made largely while he was connected with the University of California, but he still has his eyes open for any new or improved method which may prove more successful. Mr. Gray is now making investigations in Imperial Valley.

Mr. Gray has called our attention to Senate Bill 273, introduced by Senator Inman. This bill proposes to regulate manufacture, sale and use of economic poisons and aims to prevent their adulteration, misbranding or misrepresentation when offered for sale to farmers.

From statistics collected by G. H. Hecke, director of the California department of agriculture, it is estimated that about $3,000,000 is spent each year in California in the purchase of chemicals for the control of insects, fungi, noxious weeds, and rodents, collectively known as economic poisons. This information was obtained when Director Hecke was state commissioner of horticulture from estimates furnished by 41 county horticultural commissioners and compiled by the staff of the former insecticide laboratory, now a part of the state department of agriculture. The present state insecticide and fungicide law carrying the small annual appropriation of $5,000 is designed to regulate the manufacture and sale of chemicals used in the control of insects and fungi, but no provision is made to cover weed killers and rodent poisons, although something like a quarter of a million dollars are spent in the state each year for the latter group of economic poisons.

A short summary of the law mentions the following provisions: Encourage manufacture and sale of the standard and well tried remedies. Discourage sale of poorly compounded or low grade remedies prepared in a poorly equipped factory or by the careless manufacturer. Prohibit sale of worthless preparations placed on the market either through ignorance or with intent to defraud. Prohibit sale of preparations which are injurious to cultivated plants or domestic animals or are a menace to public health. Restrain activities of the clever fakir who profits by falsely claiming some new discovery or some mysteriously acting poison, and in reality is selling some common and well known substance under a camouflage of coloring matter or odor.

THE WHITE SAPOTE

The "sapote blanca" of the Spanish speaking people is the Casimiroa edulis of the botanist and belongs to the same family as the orange though tree and fruit are quite unlike those of any member of the genus citrus. The tree grows to be large, umbrageous and handsome. Within the knowledge of the writer none have been harmed by frosts and it may be that it would prove hardy in favored spots clear to the Oregon line. Aside from its fruiting, the tree is an ornamental of high value either for home grounds or street planting. While young it is slender and pole like, even as the walnut grows, but with age it becomes nearly as spreading as the mature walnut tree. The fruits vary somewhat but resemble, in their different forms, apples, quinces, or Japan plums. The excellent flesh is sometimes peach like, in other varieties pear like.

THE USE OF GAS TIGHT FUMIGATION COVERS

to properly discharge the dose without inconvenience. It is, however, recognized that with gas tight covers when there is no wind, or the wind is in the

International 8-16
The Adaptable Farm Power

ON sun-baked slopes, in rain-soaked valleys, on rolling uplands and level plains—everywhere you will find **International 8-16 Kerosene Tractors** working efficiently, converting cheap kerosene into valuable farm power.

Plowing, disking, seeding, cultivating orchards, hauling heavy loads on road and farm, pulling stumps, dragging roads, drawing mowers, hay loaders, grain harvesting machines; threshing grain, baling hay, cutting ensilage, sawing wood—on all heavy farm tasks where dependable power is required either at the drawbar or belt pulley **International 8-16 Kerosene Tractors** are rendering satisfactory, year-'round service.

The **International 8-16,** because of its light weight, snug compactness, ease of control, generous reserve power above its rating for emergency pulls, three speeds forward, economical operation and general fitness for diversified service, is highly popular with farmers in every branch of agriculture.

Fifteen years of tractor building experience and over three-quarters of a century of general farm machine success, backed by a broad-as-agriculture reputation for fair dealing, good quality and dependable after-sale service—these factors are your assurance of satisfaction when you buy an **International 8-16 Kerosene Tractor.**

48,000 ACRES
SAN LUIS OBISPO CO.

Under arrangements just completed with C. W. Clarke Co., the owner of the well-known Sacramento and other ranches near Paso Robles, I am now in a position to offer for sale in nine subdivisions ranging from 1,000 to 8,500 acres, the 48,000 acres owned by said company, at prices ranging from $18.00 per acre up, and on favorable terms.

These ranches are situated about fifteen miles east of Paso Robles, and included in their areas are thousands of acres of fine land suitable for cattle or general farming, almond growing or other fruit raising.

For further particulars, apply to
WALTER I. BRUSH
Supt. Sacramento Ranch near Shandon, S. L. O. Co., P. O. Address Paso Robles or Shandon. Tel. Paso Robles 6-F-1.

To keep thoroughly posted subscribers should read every advertisement in the California Cultivator columns.

wrong direction, the tent pullers may be in too strong an atmosphere of gas. Under such circumstances every other tent may be pulled or some other way devised to avoid the gas. At present when the tents become wet and hold most of the gas, even worse conditions are met with, because in the use of gas tight tents there is ordinarily never more than one-half the amount of gas used at the outset as compared with uresent dosages with canvas tents.

Summary and Conclusion

With the use of gas tight covers not only better and more uniform results can be secured but results can be secured where it is not now possible to get results with canvas tents.

Wind (unless a strong wind) does not interfere with fumigation of gas tight tents and the results are not impaired as is the case even in a slight wind with canvas tents.

Humidity or moisture does not increase the injury to the tree because the gas tight tent does not vary in gas holding capacity. The tents also dry more quickly.

Leakage of gas through the tent, which is the most variable and serious factor in fumigation, is prevented.

It is possible to determine a constant, or dosage for each scale, that will apply to any particular district.

Greater safety from injury to the tree and fruit, because there is less variability in dosage, is insured with gas tight tents. (This does not apply to work done in sunlight.)

With rubberized gas tight cloth the patching and repair work on tents is easily and quickly done in the field.

With the reduction in amount of hydrocyanic acid required the use of gas tight covers should eventually reduce the cost of fumigation to the grower.

We have attempted to show that there are many far reaching advantages in the use of fumigation covers that are gas tight. The only question that remains, and which we fully appreciate as being by all odds the most important, is the production of the tent that will meet commercial requirements. We have hesitated to present the subject at such an early date with this question not entirely settled by a sufficiently long period of actual experience in the field. But it is our business as investigators to determine principles and methods, and in the practical working out of such principles and methods we must be aided by work done under commercial field conditions, and by commercial companies interested in the manufacture of the product required. It is at this point and for this reason that our results thus far secured have been discussed in order that further progress will be made, which we confidently expect will be made, toward the perfection of a gas tight tent system of fumigation.

The Schedule

The schedule of dosage which has been adopted in connection with gas tight covers amounts essentially to a volumetric schedule or dosage according to the volume of the tent with a slight increase for the smallest trees and a decrease for the largest trees. The atomizer used has a plate graduated in units of ten cubic centimeters. For ordinary sized trees the schedule calls for about the same number of units as the schedule now in use, but the atomizer will deliver for each unit but 10 cubic centimeters instead of 18 or 20 cubic centiheters. If there is occasion still to speak of dosage in terms of ounces, then one ounce will correspond to one unit or ten cubic centimeters under the gas tight tent system.

When the fumigator wishes to check the amount of H. C. N. (hydrocyanic acid gas) actually used in a grove he adds the total units and then adds a cipher which gives the amount in cubic centimeters. The number of cubic centimeters divided by 640-650 (number of cubic centimeters in one pound of H. C. N. according to purity and temperature) will give the number of pounds of H. C. N. If it is desired to vary the schedule, that is the constant, it can be readily done by varying the time. In case it is desired to vary the dosage, instead of the time, then different schedules or different plates on the atomizer can be provided.

The Aldrich: *upright* or *grand*—a good piano modestly priced

THE Aldrich piano—upright or grand—is made according to our own specifications.

It is made according to standards that we have evolved out of forty-three years of painstaking piano merchandising.

Upright or grand, in any of its several models, the Aldrich, in our belief, successfully fulfills this ideal:

An instrument that we can recommend, at a price certain to be attractive.

PLANNING AND PLANTING A VINEYARD

(Continued from Page 377.)

grown because this method was used but rather that the vines grew in spite of it. It takes but a moment to remove a few shovels full of soil from under the marker on the planting line and set the vine with the top against the mark. See that the roots are straight and then fill in with moist dirt. When the hole is full tamp with your foot, and the job is done, except for placing the small wooden marker which serves to indicate the position of the vines during the first growing season.

Irrigate Immediately

As soon as the vines are planted a furrow should be plowed each side of the row close to the vines and a good stream of water applied. This water must be applied to insure the dirt being in contact with the roots. A few large air pockets which would permit the roots to dry out might cause the loss of quite a percentage of the planting.

If cuttings are used in planting, the operation is much the same except that two cuttings should be used. Place the butts about three inches apart and the tops close together. After they have started to grow the poorer one can be removed immediately after an irrigation without injury to the one which remains. The two cuttings are used to insure a better stand, although it is not always necessary to take this precaution.

With the close of this series of articles on the planning and planting of a vineyard it will perhaps not be out of place to emphasize the necessity of very careful work and a great deal of thought on all of the operations relating to the development of new acreage. Never before in the history of fruit growing in the state has the producer of quality fruit been so amply rewarded for his efforts, and now as we are entering into a period of depression it is more than ever important that the grower who hopes and expects to succeed should leave no stone unturned to produce the largest possible crops to the acre and the best possible quality of product. Get all the information you can possibly secure and when all of the factors are considered use your own best judgment on every question.

THE TOP-WORKING OF LEMON ORCHARDS

(Continued from Page 379.)

against the wood that it cannot unite with it. If budding cloth is used it must be especially strong. Most of the budding cloth on the market is useless in top-working because of its weakness. Some budders use twine. After the bud is tightly wrapped the ends of the wrap must be secured so that there is no slipping and consequent loosening. With tape a tack can be driven into the end. With twine the two ends can be tied.

Only one bud per limb is eventually retained to build the new top of the tree. It is customary, however, to place two buds to a limb so that, in case of accident, the work will not have to be done over.

The buds remain wrapped for about 30 days, but before they are unwrapped the trunk and main branches should be whitewashed preparatory to cutting off the top of the tree. This is for protection against sunburning. In preparing the whitewash the lime should be thoroghly slaked, which requires a full week. In much of the early top-working the lack of protection against sunburning resulted in very serious injury.

After the buds are unwrapped the lemon limb is girdled four or five inches above the bud to force the buds to start. The top of the tree is removed after the buds have grown a few inches long by cutting the limbs a few inches above the bud, most budders leaving a nurse limb for about a year. This nurse limb is left in order to elaborate food for the roots and so a branch is selected which connects with the trunk independently of the budded limbs, or at least springs from a point below the girdling. Nothing is better for the cut ends of the branches than grafting wax.

It is very important that someone who understands the work which has been done on the top-worked tree

As finely built as a watch

Yet as enduring as Time itself—a Byron Jackson deepwell turbine.

That's why you'll find it on the big job and the small one—wherever dependability, economy and efficiency are recognized.

The Byron Jackson is perfectly machined and when installed will be found free of the destructive vibration common to so many pumps.

This is the secret of the long life of the Byron Jackson turbine.

should follow the work along for two seasons, keeping the sprouts from the old tree cut out and heading back the growth of the buds when this is necessary. When the orange or grapefruit branches have become big enough so that one of them can be relied upon to keep the bark of the parent branch alive all of the way around the branch a slanting cut is made close to the bud, removing the stub and leaving only the growth from one bud. The cut surface is carefully waxed.

In the second method, where the buds are placed in newly grown sprouts, the trees are cut back early in the spring, about the first of March, after the trunk and main limbs have been whitewashed. The cut ends are protected as in the other method.

In the fall properly located sprouts are selected and budded. The buds remain dormant through the winter, but make an early start in the spring. It would seem as if there were some loss of time by this method, but where it has been used this loss, after a year or two, is not so apparent as one might expect. The principal advantage of the method lies in the ease with which the sprouts can be budded.

Lemon trees have been successfully top-worked to Navels, to Valencias and to grapefruit. As far as the vigor of the resulting tree is concerned, there seems to be little preference.

No one should consider using any buds except those which have been carefully selected from superior parent trees. The cost of the buds is trifling compared with their influence in determining the productiveness of the new grove. Two or three fruits in any one year will pay for the bud. The Fruit Growers Supply Company has, for several years past, been locating especially productive trees producing high grade fruit and is using these trees as sources of budwood.

The expense of top-working varies with the size of the tree, the removal of the tops involving considerably more labor with large trees than with small ones. The budding itself is not a very long process, a good budder budding about 100 six or seven year old trees a day. Top-working is, at the present time, much cheaper than replanting. The cost of budding, topping and pruning back for two successive seasons in ten or twelve year old trees is about the same now as the cost of a new tree.

More About Bulk Olives

MR. SMITH of Lindsay writes:

"I have just read your article in issue of March 5, pertaining to marketing of home cured olives and I agree with everything you said in that article.

"It would be interesting reading to have an article from the state board of health as to how their scientists cause bacillus botulinus to grow in fresh pickled olives. (Also the condition of the olives by the time the bacillus developed.) They have no argument in that reply, becase they can inoculate any fresh fruit or vegetable with botulinus when it gets to a certain stage of decomposition.

"If they prohibit fresh pickled olives being sold in bulk, they should prohibit canned olives opened and sold in bulk. I have had some experience in a grocery store and I know. For instance, a gallon of canned olives has been opened and emptied into a glass jar and before this has been entirely sold out another has been emptied in on top, and so on indefinitely, and no one knows how old some of the olives are in the bottom of the jar.

"I produced 80 tons of olives this year, and except for this ruling I could have realized something on my crop, whereas I did not only in a small way, practically a total loss."

Another reader, J. V. Dewhurst of Ojai, writes: "I noticed your discussion on home pickled olives and will give you all the information I can. Write to Berkeley and ask for the California state board of health monthly bulletin, Botulism Number. This bulletin gives the data of the investigations on botulism. After reading you will notice that only canned goods contain the toxins that cause death. The spores of bacillus botulilus, as far as I could understand, do not cause any harm but after being canned up from the air develop a toxin that causes death when eaten."

The bulletin referred to is the issue of September, 1920, and may be had by olive growers who will write California State Board of Health, Sacramento. It gives a fund of information as to the prevention of botulism in canned foods and amongst other suggestions these:

"Prevention of botulism, therefore, depends not upon curtailing the use of home canned or commercially canned foods but upon the education of those who use canned foods as to the possible danger which may accompany their use and the methods for avoiding those dangers.

"No canned food, or indeed any food, which shows the slightest sign of spoilage, whether in appearance or odor, should be served as food, or should be tasted to see whether it is good.

"No canned foods which have not been processed at high temperatures should be served or tasted without having been thoroughly cooked after they are removed from the container; this is especially applicable to vegetables of the types which are frequently served as salads. In case canned food shows evidence of spoilage it should not be discarded where other persons or domestic animals or fowl can gain access to it unless it has been thoroughly cooked.

"If it should happen that domestic animals or fowl develop signs of poisoning after eating discarded food which has been tasted or eaten by human beings, medical advice should be sought at once in order that, if the botulinus toxin is at fault, antitoxin may be given in time to be of value."

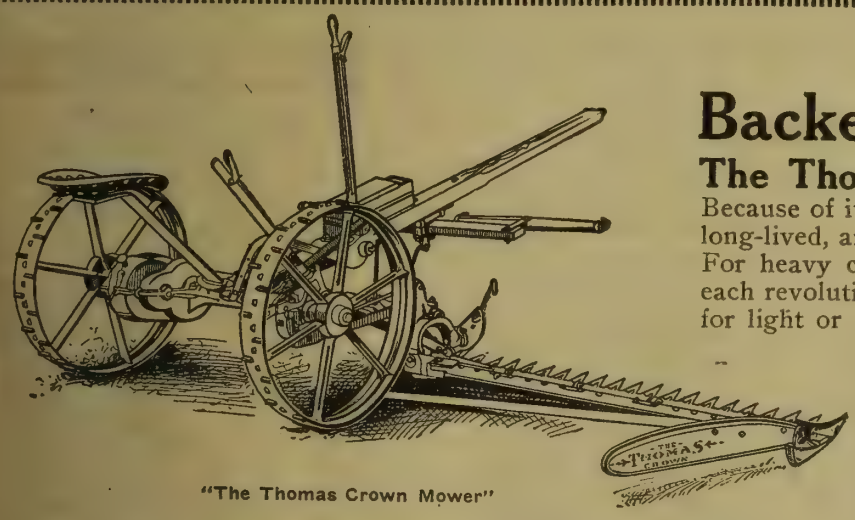
Unless the state board of health will revise its ruling before next fall's output is ripened the only safe course for the olive growers is to unite and arrange for sterilizing all fruit at 240 degrees for the required 40 minutes. But while the board of health still insists that it is possible to produce the poison toxin, or botulinus, in open or bulk olives it has mentioned no case where such poisoning has ever occurred. We feel that this ruling is no more just than would be the ruling that cucumber pickles or other similar products should be similarly treated.

PARAGUAY GUAVAS

A resident of Paraguay, South America, writes: "Of the guayaba (Psidium guajava) tree there are at least eight varieties of which I know, all growing wild and differing both in size of tree and fruit, ranging from a shrub two feet high to trees 35 to 50 feet high, and the fruit from the size of a grape to the size of an orange. As regards this fruit, some doubt has arisen in my mind as to whether this guayaba found here may be the guava. In this section of Paraguay the guayaba is very scarce, but near Asuncion in towns of Aregua, Ipacarai and San Bernardino it is very abundant, growing wild, and near the latter town one may ride for miles through forests of guayaba where you can see thousands of tons of fruit on trees and in various stages of decay on the ground."

NEW STORAGE DAM IN ARIZONA

It was announced some time ago that the federal government would begin work shortly on the Florence diversion dam in Arizona. More recently the bill for continuing this project by building canals has passed congress. This dam is primarily for the irrigation of lands owned by the Pima Indians, but incidentally it will furnish water for approximately 27,000 acres of lands owned by white settlers. This dam should not be confused with the proposed storage dam at San Carlos, which is also on the Gila river some 60 miles above Florence. The latter would impound water for irrigating some 200,000 acres of land. Work on the Florence diversion dam, it is expected, will begin within a few weeks.



"The Thomas Crown Mower"

Thomas Implements Backed by RAILSBACK SERVICE

The Thomas Crown Mower---The Only Two-Speed Mower Made

Because of its changeable speed, the Thomas Crown Mower is exceptionally long-lived, and is also much easier on the team or tractor.

For heavy cutting, fast or regular speed of 54 movements of the knife to each revolution of the ground wheels is used, and slow speed, 44 movements, for light or ordinary cutting.

By reducing the vibration, the low speed adds years to the life of the machine.

The Crown is the only mower we know of that is equipped with this important device.

This machine is exceptionally rugged, and has several other exclusive features. Superior Railsback service goes with it to California buyers.

Thomas Steel Reliable Rake

Made Right!

Years and years of experience in manufacturing high-grade rakes are back of the Thomas Steel Reliable rake.

Built substantially of the best materials, all steel and malleable construction, this rake will stand the gaff of the hardest usage.

Note these distinctive features: Rachet and box enclosed, one-piece and removable. Axles interchangeable; wheels unusually strong. Four point suspension. Raking teeth extra heavy, 7/16 inch diameter with double coils. Guard teeth 3/8 inch diameter.

The rider's weight aids in dumping these rakes, and prevents the teeth dropping back hard and straining the machine. Self dump, but may easily be dumped by hand.

Railsback service will help you get the most out of any implement ordered from us.

Visit Our Salesrooms, or write for Specifications and Prices.

The Bean Situation in California

By W. W. Douglas of the Bank of Italy

NO farmer during the present era of declining prices is suffering more acutely from the general depression than is the California bean grower. His brief period of spectacular profits, which was brought on by the war, has been followed by an equally sharp reaction. And while the prospect is by no means hopeless, the bean grower in California is so far from expecting big profits now that he will rest happy if he can make ends meet until normal conditions are restored.

The reasons for the present situation trace back, of course, to war prices and war demands. The urgent appeals for food production at that time, together with the attractive prospect for good prices, induced farmers to plant beans on every available hill top, hillside or bottom land acre in the state that was suitable for the purpose. Not only was this accomplished at an abnormally high labor cost for both planting and harvesting, but it made for overproduction in both the northern and southern parts of the state.

To make the situation worse, the market was invaded by cheaply produced and cheaply transported beans from Korea, Manchuria and the Island of Madagascar. Limas from the last named place competed with the Southern California limas and were sold in American markets at prices lower than the cost of producing them in California.

As a result the beans accumulated in the warehouses, and the prices declined to less than one-half, although the cost of production was more than double the normal cost. The bean grower is consequently a heavy loser financially. Many tenant farmers are on the verge of bankruptcy; they are crop or chattel mortgaged for more than they are worth.

Naturally under these conditions 1920 showed a heavy decrease in acreage planted to beans. This was due not only to the combination of cheap foreign competition, abnormally high production cost and low prices for the product, but to lack of rainfall during this and the two previous years. So the dry land (unirrigated land) bean grower was able to produce but a small fraction of his normal crop during each of those years. The following figures will show how rapid this decrease has been: In 1918 the California bean acreage was 592,000; in 1919, 400,000; and in 1920, 285,000. The corresponding production was 5,150,000 hundred pound sacks in 1918, 3,000,000 in 1919, and only 1,710,000 in 1920. Of the last approximately 1,000,000 sacks are Limas, so that of beans other than Limas there is a 1920 crop of only about 700,000 sacks of choice recleaned stocks. The carry over from 1919 amounted in October to approximately 900,000 sacks. Stocks of beans in warehouses throughout the state as of January 1, 1921, are reported as 191,500 sacks as against 393,500 on January 1, 1920. Growers are also holding a considerable amount of which it is impossible to learn the total.

Future conditions are not easy to forecast. The barley and mustard, which were extensively planted in 1920, proved anything but compensating crops. And the bean grower finds it difficult to decide what he will plant during the coming season, beans, sugar beets, barley or mustard. Certainly he has been hit hard by the storm.

But there are certain rifts in the clouds. While market values are showing but little signs of improvement, nevertheless trading conditions at this time are beginning to brighten up with considerably more inquiry than at any time during the past four months. Bean production in the Orient is reported to have been cut approximately 50 per cent and to have further suffered considerable damage from rain. Importations of beans from the Orient in 1920 amounted to only 500,000 sacks as against over 2,000,000 in each of the years 1918 and 1919. This shortage of Oriental beans ought materially to relieve the local situation. Moreover, all over the United States the total production in 1920 was less than the normal per capita consumption, and the present wave of economy in food and clothes may bring the bean back to its former honored place on the family menu. So the discouraged bean grower of California may yet find himself planting a larger acreage than he contemplates now.

LIMA BEAN SITUATION

Manager R. L. Churchill of the California Lima Bean Growers Association, writes: "We are just now completing check of stocks of Limas and Baby Limas on hand in warehouses of Southern California on March 1 and expect to have this in detail within the next two or three days. Based upon figures already received, we think these stocks will show approximately 165,000 bags of Baby Limas and between 475,000 and 500,000 bags of regular Limas. Two years ago at this time there were one million bags of regular Limas on hand in the warehouses of Southern California and these were all sold and shipped between April 1 and September 1, 1919. Therefore, statistically, the Lima bean market is in strong position here on the Coast and stock in the hands of distributing trade is light.

"However, the Michigan bean market has been weak and declining during the past 30 days and this has affected somewhat adversely the market on California beans with the result that all varieties, including Limas, have moved slowly with prices inclined to be dull and somewhat declining rather than firm and advancing. According to rule the light stocks on hand, the small buying of the past 30 days, the light stocks in the hands of distributors and the present low prices on beans should develop an active movement and very firm prices this month. It remains to be seen under these conditions how much force there is in the old saying, 'All signs fail in dry weather.'"

LEGISLATION WHICH DID NOT BECOME LEGISLATION

The last session of the national congress started out with wonderful "promise" of help for the food producer. Bills of all colors and shades were introduced, and every one of them went into the discard. One bill giving a measure of protection to some of our food crops was passed by both houses of congress but vetoed by the president. A vigorous effort would probably have carried it over his veto, but the vigor was not there for the farmer.

T. C. Atkeson, Washington representative of the national Grange, sends us the following account of accomplishment, or rather its lack:

Revival of the war finance corporation: Passed over president's veto.

Cold storage legislation: Died in conference.

Packer control legislation: Reported from committee; passed senate; no opportunity for vote in the house.

Mussel Shoals: Defeated in the house during the last evening session.

TRACKLAYER "SIXTY" PULLING WIDE HARROW

Lowering the Cost of Production

That is the farmer's problem — lower cost for starting, maturing and harvesting his crops.

One way of doing this is to cover more ground in faster time with less help. That means *power* farming, particularly the use of *reliable* tractors of sufficient power and endurance for the work.

Reliability is important. For your investment in power machinery this year should carry you over several years to come with the very minimum of up-keep costs.

You know the reputation of Best Tracklayer Tractors for reliability, endurance, power and low operating costs. This reputation has been earned by many years of conspicuous and successful performance on the farms of the Pacific Coast. Best Tractors are an institution in the West.

Right now you need a Best Tracklayer Tractor. You know you can depend on the Best at all times under the severest conditions of prolonged operations.

You know that your Best will be on the job not only this season, but next season and for many seasons, performing faithfully and earning a profit for you. This season the farmer will buy the machinery he needs for economical production, and will buy the makes he knows he can depend upon to give reliable, satisfactory service for many years to come.

Plant Winter Rhubarb and BERRIES for PROFIT

We can supply plants—all sorts for large fields. Plant also peaches, plums, prunes, pears, figs, apples, apricots, asparagus, artichokes, etc., for your own table and pleasure. We have a good assortment of fruits of all sorts. Write for price list. J. B. WAGNER, Rhubarb and Berry Specialist, Pasadena, Cal.

When writing advertisers, mention the Cultivator.

Capper-Volstead collective bargaining bill: Died in conference.

Emergency tariff bill: Passed both houses and vetoed by president; effort to pass over veto failed at last evening session.

Act authorizing federal reserve board to loan money to farmers: Died in committee.

Control of wheat gambling: Not reported from committee.

Agricultural appropriation bill: Passed and signed, carrying $360,000 for free seeds and $2,000,000 for relief of drouth stricken areas.

Resolution repealing war time legislation: Passed and signed by president.

Winslow bill for prompt partial payment of government obligations to railroads: Passed and signed.

Immigration bill: Passed and not signed.

All appropriation bills passed except naval. Army bill not signed.

Soldier bonus bill: Not considered, but $18,600,000 appropriation for hospital facilities passed and signed.

It will be noted that in the above list only the first nine are of special interest to agriculture and all were defeated except the war finance corporation measure which has now been in effect for about two months.

The decision of the supreme court as to constitutionality of the federal farm loan act gives, however, one hopeful sign for the producer. Whether the newly elected congress and President Harding will have any greater appreciation of present day needs remains to be seen. Commenting on the decision of the supreme court as to the farm loan act and the Lever law, Mr. Atkeson writes:

"Two decisions of the U. S. supreme court, handed down on Monday, February 28, one confirming the constitutionality and validity of the farm loan act in toto and the other the unconstitutionality and invalidity of the Lever law are also in accord with Grange policies and principles. The decision of the court in the farm loan act makes possible the immediate resumption of business by the federal land and joint stock banks, and Chairman Lobdell of the farm loan board announced that bonds will be issued, just as soon as the preliminaries can be completed, to provide for the immediate resumption of business. The Lever law, which is declared unconstitutional, is the act under which the food administration assumed its powers of controlling the prices and distribution of necessities and is one of the laws the repeal of which the Grange asked in very plain terms in a resolution adopted at Boston last November.

Queries

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Cotton Seed for Feed

Is the feeding of cotton seeds to cows, horses or mules a dangerous practice? I have read that cotton seeds fed to hogs are fatal because of the cotton adhering to the seeds when fed. If safe and advisable cow feed, would you suggest the amount to be fed in a ration of concentrates that you might make up for my use in feeding milch cows?—Subscriber, Hemet.

Cotton seed can safely be fed to cows, horses and mules in relatively small quantities. Cotton seeds or cottonseed meal seem to contain a toxin which poisons hogs if fed in any quantity. Experiments are being carried on, however, and it may be possible to work out rations for hogs which contain small amounts of cottonseed, but at the present time it is not to be recommended. Cottonseed meal has for some time been recommended as a concentrate feed for cows and has produced very good results. Cottonseed can also be fed although it is desirable to grind them. It takes about one ton and three-quarters of cottonseed to replace one ton of cottonseed meal. It contains a great deal of oil and it is not good practice to feed very large quantities as it is very laxative. You can safely feed from

Correct lubrication for trucks and tractors

Correct Lubrication is the most important factor in the successful operation of your truck or tractor.

Correct Lubrication conserves engine power for full duty; it keeps operating parts in condition for efficient service. Thus Correct Lubrication lengthens the life of your truck or tractor engine.

Zerolene is Correct Lubrication. Our Board of Lubrication Engineers has studied each type of truck and tractor engine and recommended the correct grade of Zerolene for its lubrication.

Follow their recommendations as embodied in the Zerolene Correct Lubrication Chart. Ask for one.

one to two pounds of cottonseed or cottonseed meal to dairy cattle, which feed should be mixed with other concentrates such as barley, bran, and beet pulp. Larger amounts of this can be fed up to three pounds safely providing the cow is a heavy producer and is getting relatively larger amounts of the above mentioned feeds or similar feeds. It seems that when cottonseed or cottonseed meal is fed with ensilage there is little danger of ill effects. I would suggest the following as a safe ration: 100 pounds barley, 100 pounds bran, 100 pounds cocoanut, 200 pounds beet pulp, 100 to 150 pounds of cottonseed ground. If you are feeding ensilage in relatively large proportions you could feed the 150 pounds of cottonseed, but if you are not feeding ensilage I think 100 pounds would be all that would be desirable in the above ration. Almost any one of the elements suggested in the ration could be left out without affecting the ration very markedly. I would suggest, however, that if you leave out either the beet pulp or the barley the amount of the other elements should be increased to some extent. I am sure that you will find a ration of this kind will produce good results. The amount of this ration should depend upon the production of the animals. You could feed one pound of the above mixture for every five or six pounds of milk produced per day or you could feed one pound of the above ration for every pound of butterfat produced weekly.—G. E. G.

Mountain Lilacs

I am mailing you today four specimens of plants for identification: 1, small leafed, white flowered ceanothus; 2, a white leafed, larger leafed ceanothus; 3, a blue flowered ceanothus; 4, a white flowered tree lupine.—M. F. G., Banning.

Number one seems to be Ceanothus cuneatus, though a little off type, for cuneatus means wedge shaped, and but few of the leaves of the plant sent are so, but the other characters agree. Number two is Ceanothus crassifolius (leaves like a crassula). Number three is Ceanothus oliganthus (few flowers); a better species, of the same beautiful blue, growing farther north, is Ceanothus thyrsiflorus. Number four is a broom native to the Canary Islands, Cytisus proliferus, sometimes called tree alfalfa and claimed to be a good fodder plant, especially for goats.

Budding Apricot Trees

Will you tell me how to bud or graft small apricot trees, or do they fruit without?—Subscriber, Niland.

All apricot trees planted in orchard form are budded because of the unsatisfactory nature of seedling fruits. The budding should be done after flow of sap has begun, using budwood from trees of known productive power which have been producing highest quality of fruit. A full description of the practice of selecting buds, inserting, staking and growing is too extended to give in this column.

Best Cow

Will you kindly inform me which breed of cow would be best for an all around family cow. We drink lots of milk and use lots of butter.—Subscriber, Santa Ana.

The Jersey is often preferred as the family cow, partly because of her beauty and almost invariably pleasant disposition. Again there are others who prefer the Holstein because of her ability to handle greater quantity of roughage and coarse feed. However, as a pure bred costs considerably more than a grade cow, and unless one has a particular liking for caring for and maintaining the pure bred, any good producing animal will answer for family use. But if there are children it should be borne in mind that disposition is a material factor to consider. The Guernsey and the Ayrshire are also excellent producers and if one is selected from a producing strain, without question would give entire satisfaction.

Pollinating Almonds

Will I. X. L. and Texas Prolific almonds be satisfactory if planted together?—Subscriber, Escondido.

This question was answered by J. P. Dargitz in the Cultivator some years ago, as follows: "We would not advise anyone to make a considerable planting of I. X. L., Ne Plus Ultra and Nonpareil alone. The Ne Plus Ultra is the best pollenizer of the three, but we have found very much better results by alternating Nonpareils with either Drake's Seedling or Texas Prolific. The Ne Plus Ultra might be alternated with either Drake's Seedling or Texas Prolific. The I. X. L. should be alternated with the Peerless; this latter combination in the Winters section has given good crops, otherwise the I. X. L. is a very shy bearer."

Claud D. Tribble of Elk Grove also sends the following: "We would plant Texas Prolific, as a pollinator for the I. X. L., Ne Plus Ultra and Nonpareil. From our observation as well as the experience of others, this is the best almond for pollinating, and as it outyields the Drake's Seedling, is more profitable. We believe it to be folly to plant the three varieties mentioned without one of the two pollinators.

"In planting, the rule is to plant about every fifth or seventh tree in one row to the pollinator, then plant solid rows of four or six of the soft shell, then another mixed row. Were we planting an orchard of our own we would plant a solid pollinating row every seventh row."

Does Have Abscesses

I have three does which have something like a boil under their throats, which gets rather large and then breaks, discharging a watery matter, and another boil forms. They come and go all the year round. I feed does dry alfalfa hay, some green grass and a little rolled barley once a day. Pens are on the ground. If you know the cause and the remedy, if there is any, I would be very pleased.

These tumors or abscesses arise from unsuitable feeding or from blows inflicted by bumping against hutches or from other stock while fighting. Let them develop until pus is in one common center, then bathe freely with quite warm water and while attendant holds animal, open with sharp knife, squeeze gently, getting pus all out. Wash with equal parts hydrogen peroxide and water. Dry carefully and apply some ointment to prevent flies from touching. Wash affected parts daily, bathing and applying ointment as may be needed. Feed regularly with addition of green stuff. Keep in warm dry place.—W. D. W.

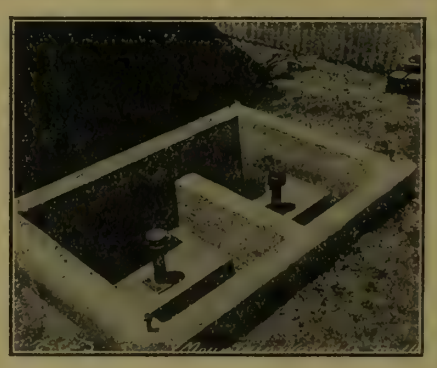
Planting the Woodlot

Will you please tell me how to start poplar and elm trees?—Subscriber.

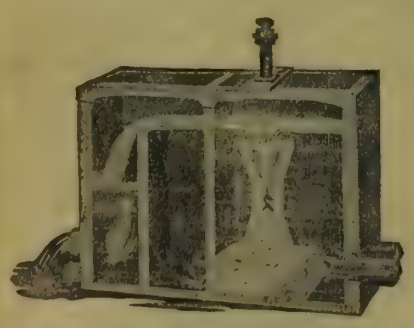
Size F 5-800 inch Meter installed for Sacramento Valley West Side Canal Co., Sacramento, Cal.

The Reliance Irrigation Meter

Will solve many of your irrigation problems.



Installation of Two Size C Reliance Irrigation Meters for South Mountain Water Company, Redlands, Cal.



This Type Meter is Made in ½, 1, 2, 4, 8 Second Foot Sizes, 25 to 800 Miner's Inches

IT WILL let you know ACCURATELY how much water you have applied at any time, thereby saving an unnecessary waste and preventing an under-application. In other words, it absolutely eliminates GUESSWORK and averts arguments. The cost is nothing compared with the results obtained.

SHOP: 953-55 NO. MAIN ST.

Los Angeles, Cal.

Regarding the planting of elms and poplars would refer the inquirer to Farmers Bulletin No. 1123, "Growing and Planting Hardwood Seedlings on the Farm." This bulletin gives definite information as to gathering seed, sprouting and planting and other information regarding practically all Eastern trees, and we note the elm and poplar are included. It may be secured by writing to the Department of Agriculture, Washington, D. C.

Fleas

Can you suggest a means of successfully exterminating fleas in an outbuilding? They are unusually plentiful this year, perhaps on account of lack of rains, and have become an awful pest.—Subscriber.

Thorough cleaning out of dust inside, and especially underneath, and removal, so far as possible, of decaying vegetable matter is one of the first steps to take in ridding out-buildings of the flea pest, or, perhaps preceding the cleaning, you might give a thorough fumigation either with hydrocyanic acid gas or with carbon bisulphide. Effective fumigation, however, is secured only in fairly gas tight buildings, but where cracks around windows and doors may be stopped, fumigation, especially with hydrocyanic gas, will rid the building of almost every living thing. Care should be exercised, however, by every human dealing with these materials, for they are deadly poison. One good full breath of the hydrocyanic gas is sufficient to cause death, and the carbon bisulphide is very explosive, so care must be exercised in keeping light or fire at safe distance when using it. If the dust and decaying vegetable matter are carefully removed and the entire building sprayed, using a power pump so as to give great pressure which will drive the liquid into all cracks, it will prove very successful. One may use a strong oil emulsion in which has been placed a good supply of carbolic acid, say at the rate of one pint to 12 gallons, or a lime-sulphur wash will prove effective. If poultry houses are adjacent to the buildings which are infested it will be well to give them a thorough cleaning and if possible move to a greater distance from where horses and cattle are kept. Cats and dogs are also carriers of these pests and should be thoroughly ridded of them or the cleansing of the buildings will result in only temporary relief. Bedding where cats and dogs have been kept should be burned or at least thoroughly renovated.

Yellow Orange Leaves

I have some orange trees planted where there has been an old cow barnyard. They are six years old and have done fairly well but now are turning yellow and shedding their leaves and beginning to look badly. Could you tell me how to treat them to overcome this trouble?—Subscriber, Anaheim.

Apparently the roots of these trees are in bad condition because of lack of air or perhaps lack of vegetable matter to lighten up the soil. We imagine thorough spading and working in of coarse vegetable matter will prove beneficial. Also make thorough examination of trunk of tree to see whether gum disease is affecting it. This trouble often follows planting trees in rich corral soil.

Sugar From the Soil

What is effect of deep cultivating or plowing during the time when the sugar is going into the grape? Is the sugar taken from the surface where the sun ripens the soil or from the deeper levels where the heavier roots are embedded?—Subscriber.

It is difficult to determine just the period of growth in grapes when the sugar is "going in." While it is true that sugar tests at ripening time indicate larger percentages of sugar in proportion to the size of the fruit, it is very probable that a large part of this sugar was already in the fruit, and its chemical nature is merely changed. All of the crude material which is taken up by the roots, whether they are the surface feeders or the ones which go deeper into the soil, must first go to the leaves, where the action of the sun on the green coloring matter changes it into plant food in the form of starches and sugars. The general practice as regards deep cultivation or plowing is to confine this work to the dormant season and only do enough work in the growing season to keep down the weeds and foul growth and maintain a surface mulch for the conservation of soil moisture.—F. K. H.

Avocados Not Bearing

I have a five year old avocado tree which has never bloomed. Could you give me a reason? It is a very strong and thrifty tree. It is a budded tree. —Subscriber, Anaheim.

Budded trees will usually make a showing of fruit before they are four or five years old but one or two varieties are rather deliberate in this respect. However, we are told by some that girdling or mutilating a portion of some of the large branches of the tree will result in its bearing. This is usually done in the fall by cutting out the bark, taking a ring, say one-fourth inch broad, entirely out of the branch. This proves such a shock that by spring time the branch may blossom and set fruit.

Kentucky Wonder Beans

Will you kindly advise how far apart in the rows White Seeded Kentucky Wonder beans should be planted, especially in new soil of a sandy nature, near the coast, and where they will be allowed to run on the ground instead of on poles? No irrigation. Any information on growing these beans for the green vegetable market will be appreciated.—Subscriber, Del Mar.

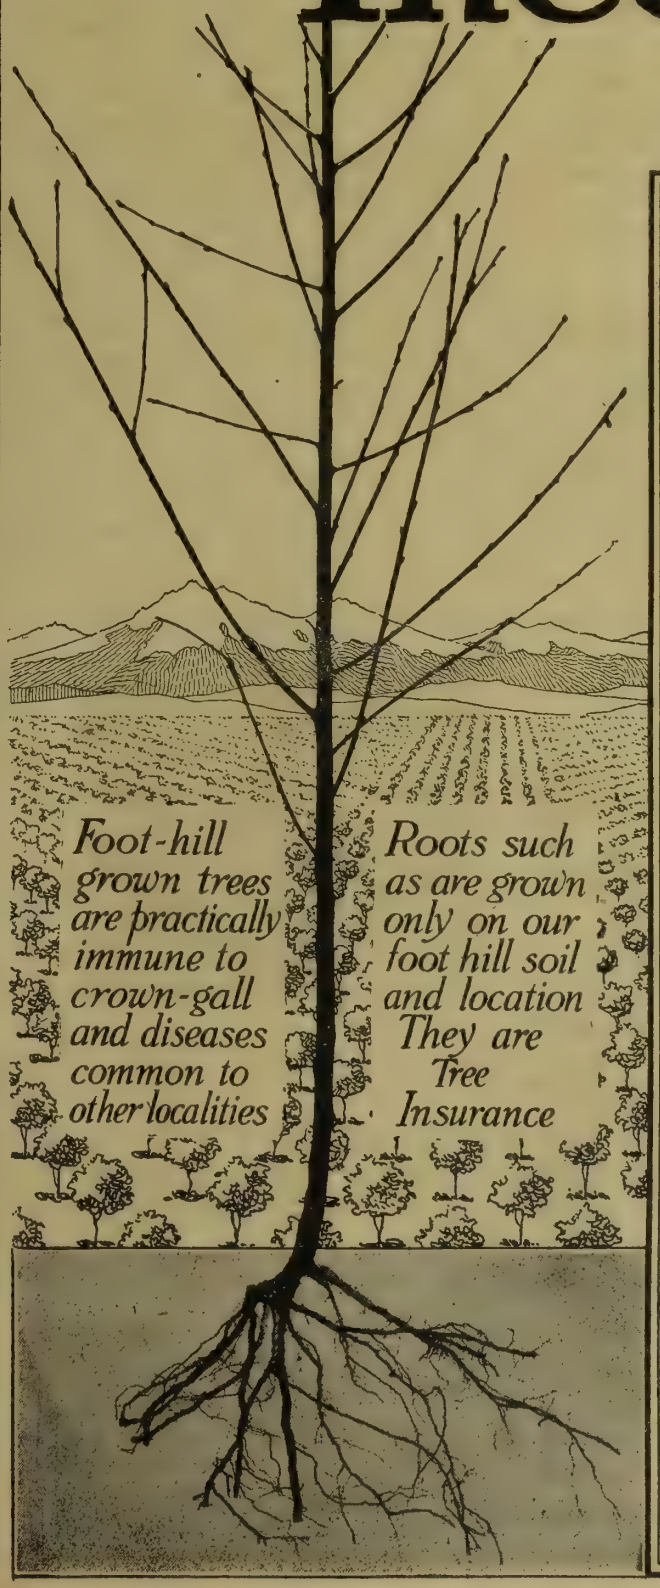
Past plantings in the San Pedro district near Los Angeles, soil and climatic conditions similar to yours, prove that vines one foot apart in the row, the rows two and a half feet apart, bring best results, none of the vines running more than three feet. When given poles to climb on they greatly exceed this length. Regarding general advice, it is now too late for best results; the beans should have been planted by the first of February for best market returns.

Aphis on Peas

How can I control thrips and aphis on peas?—Subscriber, Oceanside.

Thrips are easily controlled by strong spray, even of water, but to make it sure a small amount of nicotine sulphate 40 per cent in water with, perhaps, a little whale oil soap to make a spreader, will easily rid the plants of that pest. The aphis is also controlled by somewhat stronger solution, so we would suggest spraying the peas with solution made up of four pounds whale oil soap, ten ounces black leaf 40, 50 gallons water. One of the best controls of these pests, especially the aphis, is to begin in the fall, keeping the ground clean of all weeds which give the pest opportunity of breeding and increasing. Likewise at the present time and through the spring keep down weeds around border of the field along irrigation ditches or elsewhere near to the growing crops.

Your Future Income



Foot-hill grown trees are practically immune to crown-gall and diseases common to other localities
Roots such as are grown only on our foot hill soil and location They are Tree Insurance

No investment you make today, whether in planting of commercial orchard or in the planting of a home orchard, or for the improvement of your home orchard, will pay you such dividends in satisfaction, contentment and profit as an intelligent selection in some of the standard varieties of our still available assortment of foot-hill grown trees.

CHRIST IS RISEN

Christ the Lord is risen again;
Christ hath broken every chain:
Hark, angelic voices cry,
Singing evermore on high, Alleluia!

He who for us gave His life,
Who for us endured the strife,
Is our Paschal Lamb today;
We, too, sing for joy, and say, Alleluia!

He who bore all pain and loss
Comfortless upon the cross,
Lives in glory now on high,
Pleads for us and hears our cry. Alleluia!

He who slumbered in the grave
Is exalted now to save;
Now through Christendom it rings
That the Lamb is King of kings. Alleluia!

Now He bids us tell abroad
How the lost may be restored,
How the penitent forgiven,
How we, too, may enter heaven. Alleluia!

Thou our Paschal Lamb indeed,
Christ, today thy people feed;
Take our sins and guilt away,
That we all may sing for aye, Alleluia!
—Michael Weisse, 1531.

RISEN WITH CHRIST

O soul of mine, to life's new rapture born,
Canst thou forget the splendor of that morn,
When, through the chill and silence of thy light,
Stole the warm radiance of the Easter light?

Did not thy Lord, before the dawn of day,
Unseal thy tomb and bid thee come away?
And in that sacred garden, cool and dim,
Amid the lilies didst thou not walk with Him?

Then why shouldst thou, all trembling and afraid,
Still bring thy spices where thy Lord was laid?
Unto the heavens lift up thy downcast eyes;
Thy Lord is risen, and thou with him didst rise.

Not for the trump of doom and judgment hour
Waits, through slow years, the resurrection power.
Today he lives; today his life may be
Eternal life begun, O soul, in thee.
—Emily Huntington Miller.

AN EASTER EGG

I heard a little crackling sound,
A crunching just inside the shell,
A little rustling in the nest,
But what it was I could not tell.

Then looking close I seemed to see
A downy head, a tiny chick,
And heard a sound that seemed to say,
"Open, open, open quick!"

And then a little downy roll
As soft as silk perked up its head,
And looking out beyond the nest
A chirping voice then softly said:

"To think I could be shut up there,
Within a tiny little shell,
From all that's beautiful and fair,
And brighter far than words can tell.

"And yet I sometimes seemed to know
That some bright day the spring would come,
And something whispered in my heart
This little shell was not my home.

"And then there seemed to come a thrill,
A light seemed shining through the gloom;
I beat my wings against the shell,—
And lo! the flowers were all in bloom.

"No little shell could hold me now
That I have learned of such sweet things.
How soft the air! how sweet the skies!
And how the little linnet sings!"
—May Eve, Augusta, Georgia.

STAR LIGHT, STAR BRIGHT

(Concluded.)

The afternoon before Easter Dick had to work so very hard in the shop that he was really too tired to think. And then when he started to the shed to give the rabbit its supper, Uncle Toteman called:

"Where you goin'? Come along home now, I'm waiting."

Not daring to open the door, Dick trotted away with him. He was relieved, however, when he reflected that the rabbit could undoubtedly eat as much as it cared for from the Fairies' counter at midnight.

As for Dick himself, all he wanted was to fall into bed and then awake to find the eggs glowing in their grassy nest.

He ate a piece of corn bread and tumbled upstairs while Old Toteman watched him curiously. It was too much work for Dick's tired arms to undress him so he crawled under the quilt with his clothes on and looked up. Star Bright was beaming graciously, and Dick smiled.

"Thank you, Star Bright, for my Easter rabbit," he whispered, and fell asleep.

At midnight Dick awoke with a start. The town clock was striking and he counted feverishly. He looked out the window; the stars were gone and the blackness outside threw a shadow over him. He thought of the rabbit all alone in the gloomy shed. Right now it should be at the Fairy counter with its basket; but someway Dick felt that he had been fooling himself all along. He knew it wasn't a really Easter rabbit, that his Bunny that minute was sitting lonesomely in the dark, wondering why Dick hadn't brought the afternoon carrots.

A sob trembled in Dick's throat, but without hesitating he climbed out of bed and groped his way down stairs. He unlocked the door and ran out into the chill night. Behind him the door opened again and closed, but Dick did not notice.

It didn't take long to reach the shed, with his handful of vegetables. He unlatched the door and as his hand felt the rabbit's soft warmth his fairy tale broke altogether. He put his head down upon the friendly fur and sobbed.

The rabbit ate as greedily as ever. Dick heard it munching in the darkness, and finally the sobs ceased.

"It isn't your fault, Bunny," he said apologetically.

"You can't help it because you aren't a Easter rabbit, but I thought maybe you would bring me a basket of eggs, just for fun. I'd kind a like them. I guess some children have real eggs and candy ones too—but maybe not. It would of been nice if you could of come to my room tonight because the minute you put the kasket down you'd seen me lying there and then you'd of jumped under the quilt quick as a shot. We'd been so warm that even before I woke up, I'd known you were there."

Dick sighed, and he thought he heard the sigh echoed from without but it was only the door creaking back and forth. So he carressed the rabbit again, locked it in and hurried down the cinder path.

Old Toteman waited until Dick was out of sight. He held one hand over his eyes and now and then a sound like a sob startled the rabbit, still munching its carrots.

Finally the boy's steps died away and Old Toteman stood erect. If there had been moonlight, his face would have appeared exceedingly, strangely moved. He had never realized that Dick was a little lonely child, neglected just as he himself had been until his heart hardened against the world.

As the clock proclaimed the first half hour of Easter morning, Old Toteman started home.

It surely was a strange thing that when Dick rubbed his tear-stained cheeks in the morning, and opened his eyes, he felt a furry body cuddled against his back, and looking down saw the Easter rabbit. Then it had all been a dream.

Quivering with excitement he ran to the door and there stood a basket of woven grass, filled to overflowing with rainbow colored eggs.

EASTER BASKETS

It is a pretty idea to combine the Eastern basket and the May basket. A pretty basket may be made of cardboard covered with fringed colored paper, a nest made of real grass or fern leaves, filled with colored eggs and covered with fragrant flowers.

Hard boiled eggs may be colored with the regular egg dye papers, or with any colored tissue paper or cloth that "runs" in warm water. The school water colors may be painted on or crayolas used. It is easy to make pretty designs by cutting paper patterns of stars, circles, diamonds, etc., outlining on shell and coloring, or a pretty leaf may be held against the shell, outlined and painted a dainty green. Once started the children will think of an endless number of ways of decorating the shells.

A large basketful of such Easter eggs will be a delight to the children as a centerpiece for the Easter breakfast table, especially if they have helped with the decorating.

Candy eggs may be made of uncooked fondant. Beat white of an egg stiff, add one tablespoon milk and as much powdered sugar as can

The Cultivator Patterns

BE SURE TO SEND SIZE

3529. An Attractive Apron — Cut in 4 Sizes: Small, 34-36; Medium, 38-40; Large, 42-44, and Extra Large, 46-48 inches bust measure. A Medium size will require 3½ yards of 36 inch material. Price 10 cents.

3553. Girl's Dress.—Cut in 4 Sizes: 4, 6, 8 and 10 years. A 4 year size will require 3 yards of 27 inch material. Price 10 cents.

3530. Misses' Dress.—Cut in 3 Sizes: 16, 18 and 20 years. An 18 year size will require 6¼ yards of 40 inch material. The width of the skirt at the foot is 2 yards. Price 10 cents.

2748. Boys Suit. — Cut in 4 Sizes: 3, 4, 5 and 6 years. Size 4 requires 1¾ yard of 27 inch material for the waist, and 1⅛ yard for the trousers. Price 10 cents.

3551. Ladies' Dress.—Cut in 6 Sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. A 38 inch size will require 5¼ yards of 44 inch material. The width at the foot is about 2 yards. Price 10 cents.

3531. A Practical Child's Set.—Cut in 4 Sizes: 6 months, 1, 2 and 3 years. A 2 year size will require 2 yards of 36 inch material for the dress, ⅞ yard for the sack, and ½ yard for the bonnet for which ¼ yard of lining is also required. Price 10 cents.

3063. Dress for Home Wear.—Cut in 6 Sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. Size 38 requires 5¼ yards of 36 inch material. Width of skirt at lower edge is 1¾ yard. Price 10c.

3555. Girls' Dress.—Cut in 4 Sizes: 8, 10, 12 and 14 years. A 12 year size will require 4⅞ yards of 36 inch material. Price 10c.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very best **NEW YORK** styles, all patterns ordered are filled in **NEW YORK.** Therefore, we promise to deliver all patterns ordered within **TWO WEKS;** we guarantee safe delivery of all patterns. Los Angeles

be stirred in. A portion of this for the yolk may be colored with carrot juice (grate carrot, squeeze juice through cloth). Shape a tiny yellow ball of this for yolk, surround with the white fondant shaped like a tiny bird's egg.

Hot cross buns are never absent from our Good Friday table at teatime, and our Easter breakfast is hard to find for the table decorations.

Our hens always lay the most wonderful colored eggs for Easter, and the basketful is put in the center of the table. Around are plaster rabbits, one for each child, and the tiny cars to which they are hitched are filled with candy eggs. At each place is a pretty Easter card, and the day is made as joyous as the most beautiful of religious festivals should be.

HOUSEHOLD QUERIES

Hot Cross Buns and Popovers

Can you tell me how to make the real hot cross buns to have for Good Friday breakfast? Also I would like to find out how to make good popovers.—Subscriber.

Hot Cross Buns.—Rub ¼ pound butter into 2 pounds flour, adding pinch of salt. Into a cup of fresh yeast stir 1 pint warm milk and gradually stir this into the flour until it forms a light batter. Cover and let rise. Then work into it ½ pound sugar, ½ grated nutmeg, ½ pound currants, ½ teaspoon allspice, 1 egg. Knead well, cover again and let stand till perfectly spongy. Then knead into buns, cut a cross on top, let rise till light, brush with sugar melted in a little water and bake 20 minutes.

Popovers.—The very best popovers we ever ate were made of 1 cup milk, 1 cup flour, 1 egg, butter size of walnut, pinch of salt. Beat steadily with egg beater exactly five minutes. Have well greased muffin pans sizzling hot. Bake in quick oven.

India Relish

Would like to have a recipe telling how to make India relish.—Subscriber, St. Helena.

Here is recipe for what is called West India relish. It seems to us that we have seen another called India relish that is much more complicated and elaborate. Can any of our readers help us out?

West India Relish.—Three gallons green tomatoes. Chop fine and let drain over night. In the morning drain off all juice and add one small cabbage, 4 or more green peppers, 2 or more onions, bunch of celery, head of cauliflower, 1 pound brown sugar, 1 cup mustard seed, 1 cup salt, 1 tablespoon each cinnamon, cloves, ginger. Mix all together, cover with good cider vinegar and boil 2 hours, being careful that it does not burn on bottom of kettle. Seal in glass jars or put in stone jars.

HINTS FROM HOUSEKEEPERS

Salt Keeps It Sweet

A way to keep lard fresh and sweet for many months: As soon as the lard is cold or store lard is opened, spread a thin clean white cloth over the lard, letting the edges come up over the top of pail, then spread a thin layer of salt all over the cloth on the lard and turn the edges of cloth in over the salt, put on lid and you won't have rancid lard.

To use: Turn the cloth back or lift it out. Be sure to cover the lard with the cloth and salt well before setting away after using out of it.—Mrs. V. C. Weeks, Ontario.

Another Nut Bread Recipe

I find the following recipe for nut bread very good and thought it might interest some of your readers:

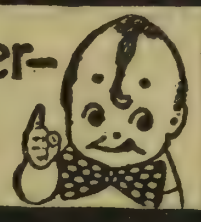
2½ cups flour, 3 heaping teaspoons baking powder, ¾ cup chopped nuts, ½ cup sugar, 1 teaspoon salt. Mix all dry ingredients together, then add one egg well beaten into one cup of milk. Bake one hour in moderate oven.—Mrs. A. E. Gilbert, Martinez.

REMEMBER to ask your grocer for Calumet Baking Powder and be sure that you get it—the Indian head on the orange label.

Then *forget* about bake day failures. For you will never have any. Calumet always produces the sweetest and most palatable foods.

And *now remember,* you always use less than of most other brands because it possesses greater leavening strength.

Now Remember—Always Use



CALUMET BAKING POWDER

There is no waste. If a recipe calls for one egg—two cups of flour—half a cup of milk — that's all you use. You *never* have to re-bake.

Contains only such ingredients as have been officially approved by U. S. Food Authorities, is the product of the largest, most modern and sanitary Baking Powder Factories in existence.

Pound can of Calumet contains full 16 oz. Some baking powders come in 12 oz. instead of 16 oz. cans. Be sure you get a pound when you want it.

Calumet Columbia Muffin Recipe
—4 cups sifted flour, 4 level teaspoons Calumet Baking Powder, 1 tablespoon sugar, 1 teaspoon salt, 2 eggs, 2 cups of sweet milk. Then mix in the regular way.

Wonderful New Hay Crop
SUDAN GRASS

First Introduced into the U. S. in 1909 from the Sudan in Africa. Tests by the department of agriculture have proved it to be of the greatest value in the Southern and Western states, where rainfall is deficient.

Culture—Sudan Grass is strictly an annual. It may be drilled or broadcasted. If drilled 8 to 12 lbs. per acre is ample; for broadcasting 15 to 25 lbs. should be used. It grows 8 to 10 feet high and yields from 3 to 8 tons per acre. You are sure of two cuttings, and if irrigated three or four cuttings.

Sudan Grass for Pasture—During the months of August, September and October all other grasses are dry, then is the time Sudan is most valuable for fall pasture, and by having it fenced in small fields it will yield food for six times as much stock as any other forage will without irrigation. For milk cows and hogs, there is no better and more abundant pasture than Sudan Grass. It will solve the hay proposition as nothing else can or will do in this climate. A good silage and balanced ration. This seed was grown on our own farm, and is free from Johnson Grass.

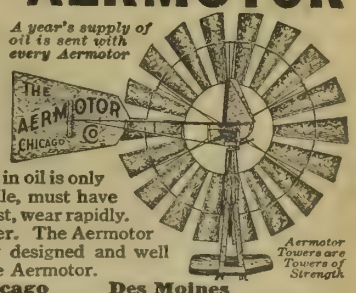
Price Per Pound:

10 lb. lots, 20c — 250 lb. lots, 12c
100 lb. lots, 15c — 500 lb. lots, 11c
1000 lb. lots, 10c

Bowman's Hardware and Implement Company
721 J. Street Sacramento, Cal.

THE AUTO-OILED AERMOTOR
A Real Self-Oiling Windmill

A year's supply of oil is sent with every Aermotor



Oil an Aermotor once a year and it is always oiled. Every moving part is completely and fully oiled. A constant stream of oil flows on every bearing. The shafts run in oil. The double gears run in oil in a tightly enclosed gear case. Friction and wear are practically eliminated.

Any windmill which does not have the gears running in oil is only half oiled. A modern windmill, like a modern automobile, must have its gears enclosed and run in oil. Dry gears, exposed to dust, wear rapidly. Dry bearings and dry gears cause friction and loss of power. The Aermotor pumps in the lightest breeze because it is correctly designed and well oiled. To get everlasting windmill satisfaction, buy the Aermotor.

MOLASSES

". . . fell off in milk production about 15%"

The Wolf Rathbone Company, Patterson, Cal., operate a large dairy. Naturally they have done everything possible to raise milk production per head.

The results they have secured with Pure Hawaiian Molasses are interesting to every man who has cows.

The letter says further:

"We ran out of Molasses for several days and found that the cows fell off in milk production about 15% at first, later increasing to about 11% below the flow when Molasses was fed. When Molasses was again fed, the cows slowly returned to the former flow of milk, or nearly so."

There is a moral here. It is: Feed Molasses, and be sure you **always** have it on hand!

Our booklet, telling how cheaply Molasses can be fed, and how to feed it, is yours for the asking. Write for it today.

LIVESTOCK SALE CALENDAR

Holsteins

March 17, Holstein Guaranty Sale, Sacramento.
April 6-7, Fred W. Kiesel, Sacramento.
April 14, R. F. Guerin, Tulare.
April 21-22, Santa Anita Rancho.
April 21 and 22—Santa Anita Rancho.
April 20-21, Toyon Farm Association, Los Altos.
April 26, Santa Anita Rancho, Santa Anita.
May 11, Victory Herd, Carruthers.

Viola L. Renwick of Santa Barbara writes that she has just sold a fine herd of Big Type Poland China hogs to Smith Brothers, Eagle Canon, Goleta. Herd is headed by Mammoth Price, a senior yearling. The sows will all farrow this month. Some are bred to the above sire and one to El Profito.

Robert N. Clapp, owner of Sycamore Acres, Nuevo, recently added 40 high class registered Holstein females to his choicely bred herd. The addition includes ten daughters of King Segis Pontiac, one daughter of Johanna McKinley Segis, two daughters of King Segis Pontiac Chicago, the $20,000 son of King Segis Pontiac, and 20 daughters of Pearl King Segis Pontiac, who is by King Segis Pontiac and out of a 37.52 pound daughter of Pontiac Korndyke that milked 753.9 pounds milk in seven days. This gives Mr. Clapp a herd tremendously strong in the blood of King Segis, and it is reported that there are many wonderful individuals in the lot.

A junior three year old daughter of Sir Veeman Korndyke Pontiac recently made over 33 pounds butter in seven days in the herd owned by Earl Graham, Compton.

A. W. Morris & Sons Corporation, Woodland, have purchased the half interest in Sir Aaggie De Kol Acme formerly owned by F. W. Kiesel, whose herd is to be dispersed on April 6-7. This gives the Morris firm complete ownership of this great young sire.

Sir Piebe De Kol Segis Pontiac, the son of King Segis Pontiac Count owned by H. E. Spires, Caruthers, now has 10 A. R. O. daughters, six having recently completed records in the Victory Herd. This bull together with all of his daughters will be sold in the Spires-Crawford dispersal on May 11.

Spring Farm Pauline Pontiac 2nd recently completed a year's test in the Bridgford Co. herd at Patterson, making 982.32 pounds butter from 26,262.2 pounds milk in 365 days. She is the dam of King Pontiac Alcartra Prilly, the high class son of King Segis Alcartra Prilly owned by H. E. Spires and J. M. Crawford. This splendid young sire also will be sold in the Spires-Crawford dispersal.

Blanche Nudine Clothilde Walker, a junior two year old daughter of Prince Riverside Walker, recently completed a record of 865.4 pounds butter from 21,786.3 pounds milk in 365 days. She is owned by Anita M. Baldwin, Santa Anita, who purchased her in the W. J. Higdon sale last May. A remarkable feature of this big record is the fact that this heifer was hauled over the California show circuit and even to the Pacific International during her test. Her butter record is exceeded in California only by Miss Aaggie Acme Burke, dam of the $41,000 bull King Korndyke Pontiac Acme.

A number of excellent records have recently been completed at Jane Garden Farm, owned by Fred W. Kiesel, Sacramento. The junior three year old Jane Garden Johanna Segis made 27.99 pounds butter in seven days; the senior three year old Lacona Elzevere made 27.95 pounds butter in seven days; the full age cow Miss Johanna Bonheur Glorianna made 28.58 pounds butter in seven days; and the senior two-year old Jane Garden Cornelia Korndyke made 23.48 pounds butter in seven days.

The University of California has recently purchased a Jersey bull from the Luckiamute herd owned by Frank Loughray and Son, Monmouth, Oregon. The bull is a son of Rinda Lad of S. B. and is out of Octavia's Duchess, a cow with a record of 651 pounds of fat. The sire has 25 daughters in the Register of Merit and the dam was fifth in class at the last Pacific International Livestock Show.

A cooperative bull association is being formed in El Dorado County and the breed that has been selected is the Ayrshire.

E. C. Curtis, who was formerly in charge of the Riverina herd of Poland Chinas owned by Alex D. McCarty of Modesto, is now in charge of the hog plant at the university farm.

Grant Brown, Jersey breeder of El Monte, reports the death of Shy Lady Viola, grand champion at the 1920 Los Angeles livestock show.

Announcement has been made that Fred L. Washburn, president and manager of the Western Meat Company, San Francisco, has resigned. Washburn is one of the best known men connected with the livestock business of the West and has always been a hearty supporter of any movement tending to develop the industry in this state. He will be succeeded by J. C. Hooper.

A local cow testing association has been formed at Cloverdale. More than 100 cows have been entered.

Sales of dressed meat and livestock from the Napa state farm during February totaled over $19,000.

P. B. Long of Tulare was a buyer at the Spurgeon Poland China sale in Missouri and secured a bred gilt sired by The Giant Disher for which he paid $140.

HOLSTEIN OWNED BY GIRL MAKES BIG RECORD

A registered Holstein-Friesian heifer owned by Olga Saxer, 17 year old daughter of John Saxer of Modesto, has just completed official records of which any Holstein breeder or owner might well be proud. The heifer is Moorland Colantha Rose 380984, that freshened as a senior three year old and in seven days made 32.01 pounds butter from 667.5 pounds milk, and in 30 days made 132.56 pounds butter from 2815.9 pounds milk, ranking her among the best heifers of her age yet developed in California. Her breeding is in keeping with her production, as she is sired by Colantha Sir Pontiac Aaggie, a son of the great transmitting bull Colantha Johanna Lad. Her dam is Primrose Lily of the Valley 2nd, with 22.61 pounds butter in seven days as a senior three year old, she by Rouble Creamelle De Kol Son, a bull bred in the famous Pierce herd, formerly at Stockton. Miss Saxer herself fed and fitted this heifer for test, fed and milked her while on test, and is now carrying on her yearly test with every prospect of securing a large record. Moorland Colantha Rose is a particularly fine individual, and Miss Saxer is to be congratulated not only upon the ownership of such an excellent heifer, but also upon the contribution her records have made to the advancement of the breed.

Alvin M. West of the Los Angeles City Club is making an effort to gather information as to some of the public benefactors who have made contributions to the upbuilding of various communities in California, that is, founders of semi-public institutions, parks, playgrounds, etc. Mr. West feels that communities should know who these men are and something of their accomplishments.

Fortunately these benefactions have extended into rural communities as well as cities, and community halls and extensive parks are beauty spots which make for better life both in the country and in the more crowded sections of the cities.

CALEDONIA SHORTHORNS

Imp. Caledonia

Caledonia Shorthorns constitute one of the choicest collections of the breed owned in America. Our herd bulls, Imp. Caledonia, Gainford Matchless, grand champion at the 1919 San Francisco show and Pine Grove King stand out prominently in the West. Our females represent choice Scotch and American families, and are noted for their type and quality. We can at all times furnish foundation material and bulls suitable for any herd or for the range. Our prices are moderate and every animal is guaranteed. Visit our farm and herd. Send for special bull list.

STATE REGISTER OF PRODUCTION FOR GRADE COWS

By Professor F. W. Woll

The college of agriculture of the University of California, through its animal husbandry division last year established a Register of Production for grade cows. Owing to changes in the staff of the division and other causes beyond our control but little progress has been made so far in the organization of the work, and only a few dairymen availed themselves of the opportunity to win distinction for their cows which this register will offer.

The register is intended to do for owners of grade cows what the various advanced registries are doing for pure breds. Unlike these, however, the Grade Register is based upon production records of ten months (305 days); cows must carry a calf at least five months of the record period in order to qualify for a certificate, and no certificate will be issued to cows that are known to have tuberculosis. The requirements for admission to the register are as follows: For cows with first calf and under three years of age at the time of freshening, a minimum production of 300 pounds of butterfat in ten months, and for cows with second calf or more, a minimum of 850 pounds of butterfat.

The register is conducted in cooperation with the cow testing associations of the state and is based on records of production obtained in these associations or in semi-official tests conducted under the rules governing such tests in this state. There is no extra expense incident to entering cows for the Register of Production to owners of grade cows in either case. On completion of the record period a neat certificate of production suitable for framing will be issued free of charge for all cows qualifying. All common and grade cows in the cow testing associations of the state and those on semi-official tests are eligible for entry, but after January 1, 1924, only cows that have been sired by a pure bred registered bull will be accepted for first entry in the register.

This register will enable dairymen to obtain production records of their best cows and gradually build up a high producing herd. As in the case of Advanced Registry cows, it will tend to increase the value both of the cows themselves and of their near relatives. In view of the importance of the dairying industry to our state it is hoped that the new register will lead many dairymen to so feed and handle their cows as to secure a maximum production from them and that it will in time prove a powerful aid in the improvement of our dairy herds. The attention of owners of good grade cows is called to the register and to the opportunities it offers to win recognition for good cows that they may own.

The writer will be glad to send copies of the rules and regulations of the Grade Registry of Production to those interested, and to furnish application blanks and further information concerning the same that may be wanted. Address Prof. F. W. Woll, University of California, Berkeley, California.

Book Review

SWEET POTATOES

"The Sweet Potato, a Handbook for the Practical Grower," by T. E. Hand and K. L. Cockerham, published by the Macmillan Company, New York.

"For many centuries the inhabitants of the warmer countries of the world have recognized the usefulness of the sweet potato as a source of food. Thus Bretschneider writes that the plant 'was described in Chinese books a long time before the discovery of America,' in the third or fourth century of our era. It was early an important cultivated plant, the roots of which supplied the place of corn in Southern China." The book consists of 12 chapters touching upon origin and description of the sweet potato, distribution, utilization, propagation, tillage, fertilizing and rotation, varieties, pests and diseases, harvesting, storage and marketing. "Although the exact origin of the sweet potato is doubtful, its widespread cultivation, which in range compares favorably with that of such plants as tobacco and maze, argues for it antiquity of many centuries." It is a 260 page book well illustrated, with very clean text.

California State Dairy Cow Competition, 1920-1922

By Professor F. W. Woll

The following address was delivered before the dairy meeting held at the university farm during Stockmen's Week.

THERE never was a time when so much thought and effort was expended to bring about improvement in agricultural and dairy conditions as is the case today. The agricultural colleges and the federal department of agriculture in its various divisions, the farm bureaus, farmers' institutes, state dairy councils or dairy bureaus, the breed associations, and other agencies, by the spoken and the written word are active in showing the way to a larger production and larger returns than in years past. Special impetus to educational work along dairy lines has been furnished by the scientific investigations conducted during the last decade or two and by the gruesome experiences of the war, which fully established not only the importance but the absolute necessity of an adequate milk supply for the welfare of the human race, both for healthy growth in the young and for the preservation of health in the adult. This makes it a pleasant public duty to do everything possible to advance the dairying industry by bringing home to those dependent on the keeping of cows for a living how their dairies may be made to yield larger and more profitable returns, how the cows may be fed and handled so as to yield a maximum production at the lowest cost compatible therewith. The fact that a large proportion of cows in common dairy herds produce less than 150 pounds of butter fat a year against a production of from 400 to 500 pounds by good dairy cows, and more than double this amount by the leading cows within each of the dairy breeds, renders the case especially interesting and hopeful. The dairyman who takes the trouble to post himself on what others are doing and upon the teachings of our agricultural colleges and other educational agencies soon sees that the chances for improvement though the adoption of modern methods of herd management are most encouraging, and once started on the road toward improvement he forgets past troubles and discouragements and becomes a booster for the cow. As the industry advances a growing appreciation among the public is apparent, the dairyman gradually comes to his own and is likely to receive the reward for his labors to which he is justly entitled and which in the past was often withheld from him.

One of the means of advancing our dairy industry, in which the college of agriculture has been engaged during the past season, is through the state dairy cow competition of 1920-1922. This is the second effort of this kind that has been made in this state, the first competition having been brought to a successful close three years ago. The story of that competition may be familiar to most of you. It is told in Bulletin 301 of our college of agriculture, which is still available for distribution. At the stockmen's meeting a year ago this week the question of conducting a second competition was discussed and the plan endorsed by the dairy farmers in attendance. The preliminaries were completed during the following two months and, according to the announcement made, the competition commenced September 1 last year. It will be continued through the present year up to and including January 1922, making it possible for us to have the formal wind-up with awards of prizes a year hence, during the stockmen's week of next year. The competition has now been continued for over five months. As entries are open to April 1, the enrollment is not complete, new entries being received almost daily. Only a progress report will therefore be made at this time, but I am happy to say that the results so far reached justify the belief that the competition will prove of still greater interest and value to the dairymen of the state than that of 1916-1918, in point of number of breeds and dairy farmers participating and of cows entered, as well as records made by the cows. At the present time 343 cows have been entered in all, of which 140 are pure breds and 203 grades. The different breeds are represented as follows: Among the pure breds—Holstein 72, Jersey 41, Guernsey 19, Ayrshire 6, Shorthorn 2; and among the grades—Holstein 116, Jersey 46, Guernsey 35, Ayrshire 5 and Shorthorn 1. These cows are owned by 40 different farmers located in 16 different counties. All these figures will, of course, be greatly changed before the entries close, and we only note at this time that this is truly a state-wide competition. Dairy farmers in all parts of the state are taking part, from Del Norte and Humboldt Counties to San Diego and Imperial. Los Angeles County has the honor of having the largest enrollment, with nine different breeders and dairymen. Stanislaus comes next with entries from 6 herds, and other counties follow in this order: San Joaquin, 4; Humboldt and Imperial, 3 each; Yolo, Riverside and San Diego, 2 each; and one representative each from Del Norte, Sutter, Sonoma, Napa, Solano, Contra Costa, Santa Cruz and Orange.

In point of wide distribution throughout the state the enrollment is therefore all that can be asked for, but one cannot but wonder where are the dairymen of the splendid dairy sections covered by the counties of Sacramento, Glenn, Colusa, Tulare, Merced and Fresno, nearly all of which have successful cow testing associations and prominent breeders of dairy cattle within their midst. In most of these counties breeders are planning to enter cows in their dairy herds in the near future, and by the time the entries close the alignment of participating breeders will doubtless have changed greatly. In the meantime we note with satisfaction that both southern and northern counties have promptly availed themselves of the opportunity offered by the competition to win distinction for owning dairy cows of exceptionally high quality and are reaping some of the benefits resulting therefrom in the way of advertisement and prizes.

The monthly summary reports that have been issued show that the average production of the cows entered has ranged between 50 and 55 pounds butter fat for the month, equivalent to over two pounds of commercial butter per head daily. Three hundred monthly records of over 50 pounds butter fat have been made; 26 of these fall between 50 and 60 pounds, 86 between 60 and 70 pounds, 50 between 70 and 80 pounds, 25 between 80 and 90 pounds, 9 between 90 and 100 pounds, and 4 over 100 pounds. The four 100 pound cows are: Johanna Hengerveld Capunna, a purebred Holstein owned by Dean Beeman of Woodland, production 103.99 pounds of butter fat; Rose, a grade Shorthorn owned by Earl Graham of Compton, 113.3 pounds; a grade Holstein owned by J. D. Hoffman of Pasadena, 101.5 pounds; and Lady Kate's Rosette, a pure bred Jersey owned by D. F. Conant of Modesto, 101.27 pounds. These and many other competition cows are rolling up production scores month by month that will be most creditable even in these days of record making and record breaking. It need not be further elaborated what splendid advertisement such records are for the owner, the breed and the state, for we consider it part of our business to let the press and the dairy world know as promptly as possible about the records made each month.

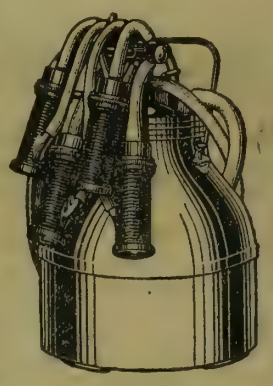
The prizes provided for in the competition through the generous assistance of breeders and dairy farmers interested in the advancement of California dairying amount in the aggregate to over $6,000, of which about $4,000 are cash prizes. All these will be awarded at the close of the competition for ten month production records by individual cows and by groups of five to ten cows in a herd, with the exception of a series of 16 monthly prizes of $25 each, offered by California Cultivator of Los Angeles for the highest average production of five grade cows in the herd in one month. This prize has now been awarded five times and was won in September by C. F. Holman of Stockton for an average production of 69.4 pounds butter fat by five grades; in October and December by two groups of five grades each owned by Earl Graham of Compton, average production of 83.3 and 76.0 pounds butter fat; and in November and January likewise by two groups of five grades in

The same factors which have made the De Laval Separator famous are back of the DE LAVAL MILKER

Just as the De Laval Cream Separator established new and higher standards of efficiency and construction, so is the De Laval Milker establishing higher standards among milkers. It is strong; durable; simple in construction and operation; easy to keep clean; saves time, and increases production.

The same policies which have made the De Laval Cream Separator the most popular and most widely used in the world are back of the De Laval Milker and are responsible for its rapidly increasing use.

Long ago the De Laval Company recognized the need for a mechanical means of milking, to place the dairy business on a machine basis. For over twenty years experiments have been conducted, and after many years of research, test and use, and not until the De Laval Company was absolutely sure its milker was actually a better way of milking, was it offered for sale. Now after four years of commercial use, in all sections of the country, owners are proving that it not only saves time and eliminates the drudgery of milking, but it actually increases the flow of milk even over good hand milking.



Service also helped make the De Laval Separator famous; and it is service back of the De Laval Milker that is helping to create preference for it among dairymen. This means that the De Laval Milker will be properly installed, that you will be thoroughly instructed in its care and operation, and that the De Laval Company's interest in you, instead of ending there, just begins.

The De Laval Separator has rendered a service of inestimable value to the dairy industry—the De Laval Milker is doing the same. It removes the one great drawback to dairying—hand milking. American farmers realize the service, stability and integrity back of the name "De Laval," all of which is reflected in the rapidly increasing use of De Laval Milkers.

When writing advertisers, mention the Cultivator.

the herd owned by Los Angeles County Farm at Hondo, average production 69.8 pounds and 78.5 pounds butter fat. Grade cows averaging over 2½ pounds butter fat a day are certainly excellent dairy cows and a credit to any herd, either pure bred or grade. They testify to the ability and the grasp of dairy problems by the owners and show the possibilities of the modern dairy cow under skillful management. The California Cultivator prize was contested for by ten different dairy farmers last month. Seven of these groups of grades each averaged over 50 pounds butter fat for the month; the two lowest averaged 41.7 pounds fat. This production, although only one-half of the prize-winning grades, is still 50 per cent in excess of what is considered the production of a good dairy cow and is over 100 per cent in excess of the average production of dairy cows in this and other states.

The preceding is perhaps sufficient to indicate the results so far reached in this state competition. We know that the present enrollment will be very materially increased before entries close by the end of next month, and confidently expect that it will prove of even greater importance to our dairy farmers and for the promotion of the dairy industry in the state than is suggested by the results reached to date. It will give ambitious dairymen the best possible opportunity to build up a reputation and increase the returns from their dairies, whether they are breeders of pure bred stock or keep grades only, and may offer them a year hence an opportunity of bringing home rewards for their labors in the form of cash prizes and trophies of different kinds. Over and above these rewards will come the satisfaction of having discovered the capacity of their cows for dairy production and of being able to feel that the profession of dairying has been raised in the estimation of their fellowmen through their efforts. Those so situated that they can enter cows in the competition are urged to do so now. We have no assurance that another opportunity of this kind will ever be offered again. It is a large machinery to set in motion, and an expensive one to the college, in spite of the liberal support received from outside parties. The services of the college of agriculture and of its animal husbandry division are at your disposal in connection with this competition, as in other ways. Take advantage of it while you may and join in this effort to put the California dairy cow at the head of the procession.

GUERNSEY BREEDERS IN HUMBOLDT ORGANIZE

The Guernsey breeders of Humboldt County have just organized a Guernsey Breeders Association, which is to be affiliated with the American Guernsay Cattle Club. E. L. Westover, western representative of the latter association, was present at the organization meeting and spoke at length on pure bred Guernsey breeding throughout the United States. There are not a great many Guernsey breeders in this county, but those who do favor the stock and have given it a thorough trial are highly satisfied with the results and hope to promote the production of pure bred cattle on their ranches through organized effort.

Guernsey, like Jersey, stock thrives in Humboldt coastal valleys which are said to more nearly resemble in climatic conditions their native home than almost any other section of the United States.

Dr. J. W. Logan, county farm adviser, was elected an honorary member of the Guernsey breeders organization, and the officers are all prominent and progressive dairymen of Eel River and Mad River Valleys. Chris. Rasmussen, president; S. V. Morrison, vice-president; L. D. Smith, secretary. —J. M. Thomas.

Snow and rainfall for the month of February were low in the San Joaquin Valley. On February 28 the total precipitation for the year was 19.09 inches. The snowfall was 168 inches for the year. Owing to the abnormally high temperatures during February 54 inches remained on February 28 at the recording station.

BAG BALM

MADE BY THE KOW-KARE PEOPLE

- in every cow barn

To keep your dairy on a maximum paying basis, look first to the health and comfort of the udders and teats. The slightest discomfort in these milk-giving organs reduces the yield, makes milking hard and encourages more serious ailments. Thousands of dairymen are keeping their cows comfortable and at full production through the use of Bag Balm for any disorder of udder or teats. Cuts, Chaps, Scratches, and inflamed or irritated conditions respond quickly. For Caked Bag, Bag Balm is without an equal. The tissues quickly return to normal upon application of this soothing, penetrating ointment.

A big package of health insurance at a little price. 65c at general stores, feed dealers and druggists. Be sure to keep it on hand; it pays for itself many times over.

Write for our useful free booklet, "Dairy Wrinkles."

DISPERSAL SALE
R. F. Guerin Herd

60 REGISTERED HOLSTEINS 60
Visalia, Cal., April 14, 1921

This is a herd of young cattle. and contains a large group of daughters of Sir Veeman Korndyke Pontiac, 30 lb. son of Sir Veeman Hengerveld.

SIR VEEMAN KORNDYKE PONTIAC has a nice list of A. R. O. daughters, including one that made over 21,000 lbs. milk in one year as a 2 year old, and she has just made over 33 lbs. butter in 7 days as a 3 year old in the herd of Earl Graham, Compton. Two other daughters, both 2 year olds, and both in this sale, are now finishing excellent yearly records at Burr Farm, Los Angeles.

The younger females in the herd are largely daughters of KING SADIE VALE IDYL SEGIS, a son of King Korndyke Sadie Vale 27th, and a 35 lb. 3 year old daughter of King of the Pontiacs.

Besides these two large groups there are daughters of KING MORCO ALCARTRA, KING SEGIS PONTIAC JANNEK, KING SEGIS ALCARTRA PRILLY, and other popular sires.

KING TOLA KORNDYKE PONTIAC is an outstanding young bull in this sale. He is sired by the $12,000.00 King Korndyke Pontiac 20th, and is out of K. P. Tola, 36.16 lb. daughter of King of the Pontiacs, now making a yearly record at Burr Farm that promises to go over 1000 lbs. butter. He is a first class individual and ought to head a good herd.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and individual certificates furnished buyers.

Write for catalog now.

SANTA ANITA RANCHO
First Individual Public Sale

60 REGISTERED HOLSTEINS
Santa Anita Rancho, Santa Anita, Cal.
Tuesday, April 26, 1921

INCLUDING:

SUNDRIE SUNBEAM GIRL, the famous dam of triplets, that made over 1000 lbs. butter last year after dropping triplets.

THE HIGHEST RECORD COWS in the herd, including a 35 lb. cow, a 34 lb. cow, and daughters of 1000 lb. and 1100 lb. cows.

MANY FEMALES BRED TO THE $41,000.00 KING KORNDYKE PONTIAC ACME, the earliest and best opportunity to select highly bred females in calf to this outstanding young sire.

TWO HERD SIRES TO BE SOLD

MERCI LAD KORNDYKE BURKE, son of De Kol Hengerveld Burke and the first cow to make over 1200 lbs. butter in one year in California. He was Grand Champion at 1920 California State Fair, and now has a 30 lb. 4 year old daughter.

PRINCE WALKER CORNUCOPIA, son of Prince Gelsche Walker and the 36 lb. cow Alba Sadie Cornucopia Creetia, who also made 866 lbs. butter in one year at a previous freshening. He is a high class individual and would not be sold except that in the reduction of the herd the service can be handled by King Korndyke Pontiac Acme.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer.

Veterinary

Answers in this column by Dr. Wm. Petrie, 2714 South Harvard Blvd., Los Angeles, are without charge. For immediate mail answer remit $1.00. In writing questions give full symptoms or particulars of injury of animal.

Indigestion

I have a fine heifer about two years old that will soon be fresh. All her life she has been fond of paper and other trash that she finds about the barnyard. She is running on green pasture but does not seem to be as fat as she should. Do you think she may have tuberculosis? If so what should I do for her?—Subscriber, Santa Ana.

The symptoms you give do not indicate tuberculosis, although she may have it. The depraved appetitie indicates a form of indigestion. Give her this: One ounce aloin, one-half ounce powdered nux vomica, three ounces turpentine and enough raw linseed oil to make one quart. Mix. Shake well and divide into three doses. Give one dose as a drench every day while it lasts. After this give her plenty of salt with a little fresh wood ashes in it.

Heifer Fails to Breed

I have a heifer that had one calf but I have tried for a whole year to breed her and have not succeeded. I had a veterinarian examine her and he says one of her ovaries is affected and she may require treatment for a long time, perhaps for a whole year. He also says that not more than 40 per cent of cows in her condition ever do breed again. He advises selling her to the butcher. What would you advise?—Subscriber, Covina.

After you have tried for a whole year to breed the heifer and failed I believe I will have to agree with your veterinarian. I would not advise starting a treatment that would last for a year. The cost would be too great. There are some things we cannot do. Probably the butcher will give enough for her to make a good start toward paying for another. That is about the best way out of it.

Lump on Jaw

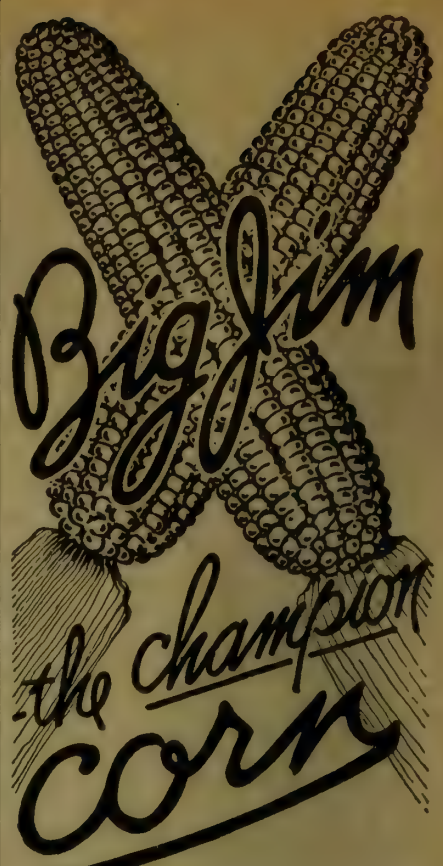
Please advise me what to do for a cow with a lump well back on her jaw. It appeared almost over night. I also notice a swelling under her chin evidently from the same cause. It is only a day or so since it came. She is a good Jersey and I wish to cure her if possible. It does not seem to hurt her as she eats green alfalfa and romps as usual. I also feed her oat hay. Is there anything in this to hurt her?—Subscriber, Yucaipa.

The lump was probably caused by a bruise or by the skin being punctured by a nail or thorn. Liniment will not do much good. If the lump softens a little in the center open it. Do not be afraid to make the opening large as it will heal better if it does not close too soon. Wash it out with warm water with enough permanganate of potash in it to make it dark red. It probably is not serious as it came so quickly.

The Santa Barbara County farm bureau has just formed a county fair association incorporating on a $200,000 basis for the purpose of putting on a fair this fall. The board of directors is now working on the problem of selling the stock and purchasing the ground.

A decision has just been handed down by the state railroad commission removing the toll on telephone calls between Santa Barbara and Goleta, placing the Goleta phones on the same basis as those in Santa Barbara. This is the result of a hard fight by the Goleta center of the farm bureau.

Lindsay, Tulare County, will this season ship some 31 carloads of broccoli. This is a new industry for Lindsay.



When growers of the Corn Belt States admit that Germain's "BIG JIM" beats any corn they've ever seen—it must be SOME corn!

It grows to gigantic height, producing an abundance of leaves and averaging two 10 to 15-inch ears to the stalk. Thrives in any soil.

Retailing Beef from Farm

Is there any law forbidding a farmer or stockman to sell dressed beef or pork?—Subscriber, Hemet.

There are several laws relative to the selling of meat. Of first importance is the federal law, providing for detailed inspection of the carcasses of animals intended for export or subject to interstate commerce. This contains a section which states that none of its provisions apply to animals slaughtered by a farmer on his farm, which may be transported in interstate commerce, provided, however, that if such animals go to a packing or canning corporation for interstate commerce they shall be subject to examination. The various acts relative to marks and brands apply to different counties of the state. One of these acts, which seems to apply generally, provides that any person slaughtering cattle shall be required to retain in his possession the hides taken from the animals with the earmarks attached thereto without any alteration for a period of ten days. Any justice of the peace, constable, or any other person may within said period demand the exhibit of such hides. For any violation of the provisions of the act a party may be held liable as for a misdemeanor. An act in force in 1917 provides that any person desiring to have the healthfulness of meat or meat products certified may make application to the state veterinarian on blanks to be furnished. Upon receipt of this application, inspection of the establishment shall be made and official brand given, which shall be used to mark all products. Cost of inspection shall be borne by the establishment. When in the opinion of the state veterinarian the volume of business is sufficient to continue the inspection the establishment shall pay a fee of $150 per month. If more than one inspector is required to be provided, the fee shall be increased. In case of less than one inspector, the fee shall be prorated among the establishments. In no case shall the fee be less than $50 per month. The slaughtering shall be conducted between seven o'clock in the morning and seven o'clock in the evening. The animals must be inspected before slaughter and also post mortem examination made. This act is, however, permissive. That is to say, a person can have the examination or not, as he may desire. There seems to be no state act or general application requiring such inspection to be made or in any wise forbidding sale of such meat. It may be that there are in some counties ordinances which contain provisions with respect to the slaughter of animals.

Fence Law in Oregon

I have a piece of unimproved timber land with no buildings. Am I required to build a half-line fence?—Subscriber, Fruitdale, Oregon.

There seem to be different laws applicable to different counties of Oregon with respect to fencing. The general rule seems to be about as it is in California, that is to say, the owner of property is not compelled to build a fence but cannot maintain an action for damages against trespassing cattle in case no fences are built.

President Raises Own Salary

Is it illegal for the president of a corporation to raise his own salary from time to time without authority from the board of directors? If illegal, what is the penalty?—Subscriber, Galt.

Unless the authority is given to the president in the by-laws of the corporation it would certainly be out of his authority to take any such action. A stockholder or the board of directors acting for the corporation could recover the amount of the excess salary in an action brought against the president.

Corporation Funds

Is it illegal for the president of a corporation to loan funds on a note of the corporation without the consent of the board of directors when the corporation is not in the money lending business? If illegal, what is the penalty?—Subscriber, Galt.

There might be instances where the president was justified in such action, but generally considered it would be out of his authority and either the president or the person to whom the money was loaned could be held liable for the return of the money due to the corporation irrespective of the term of the note. A president of a corporation is a mere agent whose authority is bounded strictly by the by-laws and articles of incorporation and also the acts of the board of directors and stockholders. His acts outside of this authority are just as invalid as those of any other agent and like penalties may be prescribed. It may be that criminal complaint might be issued as has been done in similar cases.

Partnership

Two parties engage in partnership by verbal agreement. Thereafter, one denies the partnership, obtains the profits of the business and disappears. The other obtains judgment against him and brings action against his bondsman, who takes action against both of the partners for the money misappropriated by the one. Could the bondsman obtain judgment against the remaining partner and what action should he take to protect his property from the liability of such judgment in case the papers in the action have not been served?—Subscriber.

In a complicated action such as the above where the parties must undoubtedly have legal advice, it would hardly be possible to give any answer as to the possibility of the bondsman obtaining judgment. There are means that people do adopt to conceal their property from creditors, but the writer does not feel that this is a medium for making known such methods. The subscriber should see his attorney and follow closely the attorney's advice.

Laws of California

What is the best work which a layman could obtain for reading up on the laws of California?—Subscriber.

The codes of this state are published by law publishers in San Francisco, but in case of any serious difficulty, it would certainly be a part of wisdom to take the matter up with a competent local attorney.

Foreclosing Trust Deed

I have a trust deed running for a number of years. Can I foreclose before the expiration?—Subscriber, Yolo.

The contract must be performed in accordance with its terms. If the party who executed the trust deed keeps up his payments, the principal, taxes and installments, in accordance with the terms of the contract, he is entitled to have it run for the full period. If he fails to keep up his payments, then the deed may be foreclosed in accordance with its terms.

Terminating Contract

What action must be taken to terminate an agreement for the purchase of real estate where the purchaser has failed to pay the principal and interest due?—Subscriber, Artesia.

If the contract has been recorded, an action to quiet the title to the real property could be taken or an action in equity to rescind the agreement or an action upon the agreement affirming the sale to collect the balance due could be taken. Which form is preferable in the individual case would necessitate an examination of the contract itself, and the circumstances of the case.

Trial Postponed

A year ago I was arrested on a misdemeanor charge, pleaded not guilty, and was released on bail. My attorney

DISPERSAL SALE

135 Federal Tested Registered Holsteins

Toyon Farm Association

LOS ALTOS, CAL.

April 20-21, 1921

This offering consists of 115 young females and 20 bulls.

There is a wonderful quality of breeding present, including many daughters of Sir Pietertje Ormsby Mercedes 43d, Sir Pietertje Ormsby Canary, Sir Aaggie Mead, Sir Korndyke Ormsby Piebe, Sir Bessie Fobes Tritomia, Mutual Fobes Longfield De Kol, Sir Ormsby Burke Segis, and others of corresponding worth. THE BRED FEMALES are mostly in calf to Sir Pietertje Ormsby Mercedes 43rd, Sir Pietertje Ormsby Canary, and Sir Aaggie Mead.

SIR AAGGIE MEAD is in the sale. He is one of the greatest young sires ever led into a sale ring in the West. Sired by Sir Aaggie De Kol Acme, and out of Aralia De Kol Mead who made a strictly official record of 1215 lbs. butter in one year, he combines blood lines of the highest worth and popularity. He is a high class individual and his first calves are very satisfactory.

DAIRYMEN, by all means attend this sale if you are in need of a young bull. There are 20 to select from and they are good ones.

BREEDERS, besides Sir Aaggie Mead there are a number of young bulls in this offering that are the sort to head purebred herds, representing lines of breeding not available in the west except in this sale.

Everything over six months old tuberculin tested by Federal Veterinarian and individual certificates furnished; every animal guaranteed to be a breeder.

$7.50 after 30 Days FREE TRIAL

WE will send an Imported Melotte Cream Separator direct to your farm on a 30 days absolutely Free Trial—No deposits—No papers to sign—Use it as if it were your own separator. Compare it—test it in every way.

You and you alone are the judge.

We don't want anybody to send us any money on the Melotte. We want to prove first that it is the best separator possible to buy anywhere in the world.

No Money Down

Don't pay a cent until you are convinced the Melotte skims cleaner, turns easier, washes quicker, lasts longer than all others. Then you pay $7.50 as first payment and small monthly payments of only $7.50 until the separator is paid for.

Belgium Imported — Duty Free Melotte

Invented by Jules Melotte, the Edison of Europe, this wonderful separator stands first in all dairy countries of Europe. Used on 90% of all Belgium Dairy Farms, where every penny must be saved. Special Act of Congress admits the Melotte Duty Free to save money for American farmers.

You pay no duty. Water freight is only $1.75. Rock bottom price and *easy payments!*

Self Balancing Bowl

The Belgium Melotte is the only single-bearing - bowl separator ever made. This patented bowl hangs from one frictionless ball bearing and spins like a top. It is *self-balancing.* It skims as perfectly after 15 years' use as when new. Positively can not ever get out of balance—cannot vibrate and thus cause cross currents which waste cream by remixing with the milk. The 600 lb. Melotte turns as easily as the 300 lb. machine of other makes. Spins for 25 minutes unless brake is applied. No other separator has or needs a brake. The Melotte bowl has solved the problem of perfect skimming.

Send This Coupon

Fill out and mail the coupon for New Melotte Catalog containing full description of this wonderful cream separator.

Don't buy any separator until you have found out all about the Melotte, its 15-year guarantee and our 30 Day Free Trial Offer.

Don't hesitate a minute. Don't do another thing today until you have mailed the coupon.

HEREFORDS AVERAGE $236

The 57 head of Hereford bulls and females consigned to the sixth public sale held under the sponsorship of the Pacific Coast Hereford Cattle Breeders Association at the university farm, February 23 brought the 13 consignors an average of $236.50. This sale, like the Shorthorn the day previous, proved to be a buyer's sale rather than a seller's, and while the general average was considerably lower than former sales held by the association the values were not greatly out of line with Eastern sales and only reflected the present stringency of the money market. Many men were present who expressed themselves as in need of cattle and willing to pay fair values for the better sorts but stated that they were unable to finance themselves until such a time as they could move such grain as they had in storage.

A weakness of the present situation was disclosed in the lack of a strong demand for females and indicated that before there is established a real market for the better sort of herd bulls more breeding units must be scattered throughout the state. The bull demand was confined largely to range men, and in as much as they were not forced to extend themselves they were able to fill their needs from a superior collection of bulls. Such cattle as were offered were a histinct improvement over the 1920 spring sale and the buyers can feel themselves fortunate in securing a class of cattle as were offered were a distinct their herds.

For the first time entries were received from Oregon breeders and the quality of cattle from the North was excellent.

The top of the sale was obtained by the University of California for their 2-year-old, California Prime Donald 3d., that was phrchased by the Simon Newman Company of Newman for $675. The top female was Lady Gladys from the Cazier offering that sold with a November bull calf at side sired by the noted Engle bull, Beau Blanchard and rebred to the Cazier sire, Beau Blanchard 76th. This lot was picked up by John A. Bunting of Mission San Jose at the extreme bargain price of $525.

The sale was efficiently managed by C. L. Hughes of the California Breeders' Sales and Pedigree Company. Col. H. L. Hull of Des Moines was the auctioneer and made a most favorable impression on the breeders present. He was assisted in the ring by Cols. John A. Davis of Manteca and George W. Bell of Tulare.

PUREBRED SIRES ON FOREST RANGES

Purebred bulls have proved their value for improving range herds, and the number being bought in the cow country of the West is rapidly increasing each year. The scrub bull is now blacklisted on the big national forest pastures.

During the season of 1919 three local livestock associations, the members of which use the ranges of the Sierra national forest in California, adopted rules for the purchase of purebred bulls. Under a special rule each association was required to place on the range a sufficient number of purebred Hereford, Shorthorn, or Aberdeen-Angus bulls. A committee to purchase and pass upon the credentials of each animal to be turned loose on the ranges was appointed.

Under this plan, during the grazing season of 1920, 105 Herefords, 97 Shorthorns, and six Aberdeen-Angus bulls were purchased by the stockmen through their associations and placed upon the range. It is estimated that at the end of the season of 1920 the stockmen had not less than 200 registered bulls on their ranges, resulting in a great improvement in the grade of steers turned out.

The forest service assists these local associations in enforcing the rules which require that the same kind and grade of bulls be placed on the same range. Permits to graze on the national forest pastures are refused those who do not conform to the association's ruling and who have not paid their share toward the purchase of the association bulls.

JERSEY BREEDERS ASSOCIATION

Judge Peter J. Shields presided at the recent annual meeting of the California Jersey Breeders Association at Davis. There was rather more enthusiasm among the Jersey breeders than usual. The matter of a special publication to be distributed at the University Farm picnic was referred to a committee; also committee appointed to secure funds to finance California's part of the expense of maintaining a Western Jersey representative. This committee consisted of Messrs. Jenkins, Wherrell and Fortini. Calf club work was discussed with State Farm Bureau Leader Ryerson. Guy H. Miller reported regarding trip to Portland as delegate of the California Jersey Breeders. Congratulations were extended through committee, consisting of Messrs. Miller and Hayworth, to Mr. Conant because of record of one of his cows, in a start on her official test, of 100 pounds of fat per month. It was voted to give fullest support to a Western Jersey show to be held as soon as a Western field man could be secured on the job and sufficient financial assistance guaranteed.

TUBERCULOSIS ERADICATION

At the end of the last calendar year there were in the United States more than 5,000 accredited herds free from tuberculosis. One June 30, 1920, there were 3,370 such herds, and six months later, on December 30, there were 5,013, according to figures just compiled by the bureau of animal industry, United States department of agriculture. During the six months period there has been a marked increase in the number of herds that have successfully passed one test. On June 30 there were 16,599 such herds, and on December 30, 27,842. The department issues a report each month showing by states the number of herds that have been tested, the number of cattle that have reacted, and the number that have been found to be free from the disease.

Minnesota, with 731 accredited herds, leads all other states, with Wisconsin second with 496 herds, and Pennsylvania third with 425. During December 1,447 herds, in which there were 13,979 cattle, were tested in Mississippi. In Wisconsin 851 herds, having in all 15,411 animals, were tested.

We are going to disperse our entire herd of Guernseys. We offer you one or all.

50 GUERNSEY FEMALES

with records up to 751 lbs. in A. R. Springing heifers and heifer calves. Bull calves of all ages. All tuberculin tested and guaranteed breeders.

Hollow-Hill Farm
COLTON, CAL.

SENSATIONAL DISPERSAL
180 Registered Holstein Cows and Heifers 180
3 HERD BULLS 3
Jane Garden Farm, Sacramento, Cal.
April 6-7, 1921

In Announcing This Sale the Following Items May Be Taken into Consideration:

EVERY FEMALE in the herd will be sold.

THE THREE HERD BULLS, King Korndyke Pontiac, Prince Gelsche Walker Korndyke, and Aristo Korndyke Pontiac will be sold.

SIR AAGGIE DE KOL ACME, owned jointly by Mr. Kiesel and A. W. Morris & Sons Corporation, will not be sold. The Morris firm has just purchased Mr. Kiesel's half interest at private treaty.

NO YOUNG BULLS will be offered in this sale. Jane Garden Farm has for several years had a well organized and successful method of disposing of young bulls, and this plan will be carried out with the young bulls now in the herd.

EVERY ANIMAL is positively guaranteed to be a breeder; no animal is sold tuberculin tested.

Because of their influence on this offering, please consider carefully these three bulls:

SIR AAGGIE DE KOL ACME, son of Aaggie Acme of Riverside 2nd, 1331.78 lbs. butter in one year, the world's strictly official record. He is one of the outstanding young bulls of the breed today.

KING KORNDYKE PONTIAC, son of King of the Pontiacs and May Korndyke 2nd, who is half sister to the dam of the new world's record milk producer, Segis Pietertje Prospect, and is out of May Korndyke, for many years the youngest 30 pound cow of the breed.

PRINCE GELSCHE WALKER KORNDYKE, son of Prince Gelsche Walker, and the same dam as King Korndyke Pontiac, May Korndyke 2nd. He is a proven sire, with daughters up to over 31 lbs. butter in 7 days at 3 years.

The breeding represented by these three bulls holds a foremost place in the breed today, and makes their blood a valuable addition to any herd. Consider now that there are

40 DAUGHTERS OF SIR AAGGIE DE KOL ACME IN THIS SALE
30 DAUGHTERS OF KING KORNDYKE PONTIAC IN THIS SALE
30 DAUGHTERS OF PRINCE GELSCHE WALKER KORNDYKE IN THIS SALE

and that the sale also includes

OVER 25 FEMALES BRED TO SIR AAGGIE DE KOL ACME
OVER 30 FEMALE BRED TO KING KORNDYKE PONTIAC

An outstanding feature of this herd is the growthiness of the individuals as a whole, for proper feeding and growing of the young stock has always been rated a cardinal principle in successful breeding at Jane Garden Farm. In connection with this, the element of age enters largely into the value of this offering, which is essentially one of young cattle. In surveying the ages of the females we find that one was born in 1911; three in 1912; four in 1913; six in 1914; twelve in 1915; eighteen in 1916; twenty-two in 1917; twenty-three in 1918; forty in 1919; twenty-nine in 1920. This accounts for 158 of the 180 females in this sale, the balance being heifer calves born since Jan. 1, 1921.

Unquestionably this offering presents an opportunity for the selection and purchase of highly bred young females carrying blood of proven and popular worth, seldom if ever equalled before in California.

As to Production Records

A very large percentage of the females of milking age in the herd have official short time records, or semi-official 305 and 365 days records, or are now on test. Included in the offering is a wonderful group of two, three and four year olds, with official records ranging up to over 34 pounds butter in 7 days for a 3 year old. A large group is now on yearly test, some well along on their records, and all females now fresh or to freshen before sale will be carried on test up to sale day so that buyers may carry them on if they wish.

Just consider the great value of the calves from these high record young females, sired by such bulls as Sir Aaggie De Kol Acme, King Korndyke Pontiac, Prince Gelsche Walker Korndyke, and Aristo Korndyke Pontiac.

The owner is prepared to extend most liberal terms to those who make satisfactory arrangements for credit with him prior to sale. Applications may now be made either in person or by letter to FRED W. KIESEL, California National Bank, Sacramento, Calif.

Catalogs will be ready for distribution on March 26. Write for one now.

POULTRY

Best Chicks Grow Into Greatest Winter Layers, cost little more, yield greatest profit. Our White, Brown, Buff Leghorns, Andalusians, Anconas, Reds, Rocks, Minorcas, Wyandottes (ducks, turkeys), bred 20 years to lay winters and 180-290 eggs yearly, often clear customers $5.00. "Pullets raised from your chicks averaged 209 eggs last year"; "114 hens cleared $612 in 12 months." "Fourteen pullets laid 300 eggs January, 330 February." "Get more winter eggs from 60 your hens than from 200 formerly;" 140,000 electrically hatched. Half booked, yet nearly every week open for thousands, reasonable. Former customers take half. Don't delay. Write (rarely home) Profitable Poultry, 19 North Fair Oaks, Pasadena.

Baby Chicks — We have the following varieties of Thoroughbred Baby Chicks every week: White Leghorns, Anconas, R. I. Reds, Fancy Dark R. I. Reds and Barred Rocks. We use only well selected eggs from rigidly culled flocks. BY SPECIAL DELIVERY. This year all chicks are sent by Parcel Post Special Delivery, thus delivering at your door chicks in the best possible condition, and in the shortest length of time. You should send for price list and put your orders in now. Orange County Hatchery, Harold C. Hebard, Prop., Santa Ana, California.

Buy Early Chicks—Early hatched chicks are the best always. They are stronger, much easier to raise than late chicks, mature and lay earlier, develop into larger and better birds. We are now booking orders for early hatched chicks. Do not fail to place your order in time for the early hatches. Several varieties from our own breeding pens. Circular sent upon request. Beresford Poultry Farms, San Mateo, California.

S. C. White Leghorn Baby Chicks from heaviest laying (Hoganized) stock. Safe delivery live vigorous chicks guaranteed. No money in advance; pay on delivery. Prices for May and June $5.00 per 25, $9.00 per 50, $14.00 per 100. Special prices 500 and 1000 lots. Largest electric hatchery in the World. Established 1898. MUST HATCH INCUBATOR COMPANY, 438 Seventh Street, Petaluma, California.

Sly's Old Mission Strain Rhode Island Reds. My customers won highest honors at various California shows last season. See testimonials in new catalogue now ready. Six ideal matings. Hatching eggs at reasonable prices. NO BABY CHICKS. A. G. SLY, 1642 (D) Middleton Place, Los Angeles, California.

Baby Chix—S. C. White Leghorns from open range standard bred parent stock of utmost utility. Protect yourself in having your order booked early. Prices, etc., on application. I. X. L. Hatchery, 519 Upham Street, Petaluma, Sonoma County, California.

S. C. White Leghorn Baby Chicks from my carefully selected, pure-bred stock of S. C. White Leghorns. Orders for spring delivery booked now at $15.00 per 100, $140.00 per 1000. Write for particulars. J. R. Heinrich Poultry Yards, Arroyo Grande, California.

Santa Cruz Chicks — White, Brown and Buff Leghorns, Anconas, Minorcas, Barred Rocks, Reds, Buff Orpingtons, White Rocks and White Wyandottes. Write for 1921 folder with price list. B. W. Archibald, Soquel, Santa Cruz County, California.

Baby Chicks — Barred Plymouth Rocks and Rhode Island Reds in 25, 50 and 100 lots 20c each. Hatching eggs $2 per 15. We ship by Parcel Post, pay all charges. Write for circular. Hargett & Son, Route 2, Compton, California.

Baby Chicks hatched to order from Black, White and Buff Minorcas. Eggs for sale. Also 4 White Minorca Cockerels $5.00 and $10.00 each. Black Cochin Bantam Eggs. Horace W. Crowell, 58 N. Craig Avenue, Pasadena, California.

White Leghorn Chicks from Tancred's 300 egg strain. Write for 1921 price list on all breeds. Am installing electric incubators. Have a few Jubilee and Pioneer to sell at a bargain. Enoch Crews, Seabright, California.

Watch Us Grow—"Quality Chicks." We are now booking orders for the season of 1921. White and Brown Leghorns, R. I. Reds and Barred Rocks. Order early. E. W. Ohlen, Campbell, California.

For Sale — Hoganized White Favorolle with laying records 230-240. Setting of 15 eggs $5 and $10. White Favorolle Poultry Farm, Andres Stammerjohann, Ontario, California.

TURKEYS

Turkeys — "Goldbank Boy." Champion Giant Bronze young tom. First Prize Cockerel at the New York, Madison Square Garden Show, the premier show of America, with 4311 poultry exhibits, held January 18th to 22nd, 1921, has just been imported by us, arriving at our mountain ranch February 26th. His sire, "Goldbank VIII," was grand champion at the same show, winning first in Cock class. We have mated this young champion bird to a limited number of twenty and twenty-one pound fancy, highly colored, eastern bred hens, also just imported. No eggs of this strain for sale this season at present.

A thirty-six pound yearling son of "Copper King V," the famous thirty-eight pound yearling giant bronze grand champion of the 1919 Madison Square Garden Show, will head our other flock—having mated him to our choice twenty pound hens. Egg prices reasonable. Two young toms of this last strain on hand for immediate delivery. For further particulars address: Bronze King Mountain Farm, Box 308, Calistoga, Napa County, California.

"Points on Successful Turkey Raising," our illustrated pamphlet, as described last week, price 50c a copy. R. M. Dodge and Son, Stafford Farm, Route 2, Bakersfield.

Good buildings, electric pumping plant, plenty water, shallow lift, good for dairy, general farming (including cotton), hog or turkey ranch. Crop or cash rent. Owner—W. F. Marks, 1318 West Third Street, Los Angeles. Phone 52471.

LEGAL QUERIES

(Continued from Page 399.)

has postponed the hearing on the case. I now wish to know when this case will outlaw and how I can obtain return of the bail money.—Subscriber, Obispo.

The case having been postponed at the request of the defendant, the defendant could not take advantage of his own requests to claim the benefit of the statute requiring a criminal case to be brought to a speedy trial. The most expeditious remedy in the above case would be for him to pay the attorney the fee which the attornew is evidently waiting for and proceed with the trial. If he is found innocent, bail money will then be returned.

Water Polluted

What are the penalties for dumping garbage, refuse and cleanings from a hog pen on a bank of a running stream so that the seepage thereof runs into the stream and pollutes the water of the neighbor just below?—Subscriber, Santa Barbara.

Probably the quickest action would be to take the matter up with the district attorney of your county under the provision of the penal code, providing that anyone who places offal of any kind in or on the borders of the stream from which water is drawn for the supply of any portion of the inhabitants of the state, so that the drainage thereof is taken by the stream, is guilty of a misdemeanor, punishable by imprisonment in the county jail not exceeding one year or a fine of not exceeding $1000, or both such fine and imprisonment. This section also applies to one who keeps horses, mules, swine, sheep, or livestock of any kind penned, corralled or housed on or over the borders of said stream, so that the waters may become polluted thereby. You also have a civil action to enjoin the nuisance.

In ancient times on the morning of Easter it was the custom for one person to salute the other:

"Christ is risen."

Then the reply would come:

"Christ is risen, indeed."

This same custom still prevails among the peasants in some of the European countries and also in our own America among members of the Moravian church.

Dr. LeGear Says:

"You can hasten the growth of your chicks"

Thrifty, fast-growing chicks are money-makers.

Why suffer chick loss, when it costs so little to use Dr. LeGear's Poultry Prescription, which helps to fortify their systems against disease, build up their vitality and health and helps pullets develop into early fall layers.
The use of Dr. LeGear's Poultry Prescription will mean more poultry profits to you, as thousands have already proved.

Poultry Queries

Conducted by J. A. Koethen

English Red Caps

Two weeks ago I noticed in the Cultivator that a reader wanted French Red Caps. I have not heard of the French but do know of the English Red Cap and would be glad to send address if the reader is interested in that variety.—Mrs. G. H. Kittmann, Rt. 3, Bx. 307, San Jose.

Nodular Taeniasis

On dressing a chicken I found the intestines almost covered with what looked to be small yellow pustules, only hard. In the back were small particles of a hard yellow substance. We thought they indicated tuberculosis till we cut into an intestine and found it full of tapeworms, flat and white. Can you tell me cause and remedy?—R. H. B., Lodi.

No one knows just where these tapeworms come from. Some say, from eating slugs, but it seems more likely that their eggs are picked up on contaminated soil. This particular worm is known as Nodular Taeniasis. Extract of male fern, turpentine, areca nut, powdered kamala, pumpkin seed, pomegranate root bark and Epsom salts are the chief drugs used for tapeworms. Salmon recommends mixing in the mash a teaspoon of pomegranate root bark for every 50 birds. This is followed with two or three teaspoons of castor oil for each affected bird if the number is not too great for individual treatment. Powdered areca nut may be given in doses of 30 to 45 grains mixed with butter and made into pills. Male fern may be used in powder form (dose 30 grains to 1 dram) or in liquid extract (dose 15 to 30 drops). It is given morning and evening before feeding. The dose of oil of turpentine is 3 teaspoons, but it is most effective when introduced directly into the crop with a catheter. Sometimes tapeworms can be cured by chopping up pumpkin seed and letting the birds eat all they will. As you are not sure that others of the flock are affected you might try the pumpkin seed or pomegranate root treatment first. If you find worms in their droppings you will know that they are affected, otherwise you cannot know.

Hatching Ducklings

I have duck eggs under a hen, which will hatch Easter Sunday. When should I test them? How shall I feed the ducklings? Shall I sprinkle eggs? —Subscriber, Nipomo.

Duck eggs with pure white shells are often tested as early as the fourth or fifth day, when the embryo can be clearly seen. Test again on the fourteenth day all that do not show a clear, distinct line of demarkation between the air cell and the growing embryo. The eggs are usually sprinkled two or three times the last ten days with water heated to about 100 degrees. A good nursery feed for ducklings consists of equal parts rolled oats and bread crumbs with 3 per cent sharp sand added. This is fed 5 times a day on a clean board. After 3 days change to equal parts bread, rolled oats, bran and corn meal. After 7 days change to 3 parts bran, 1 part middlings or low grade flour, 1 part corn meal, 10 per cent cut greens and a little beef scrap which may be gradually increased to 5 per cent. Moisten with water till crumbly. Ducklings do not do well on dry feed. After the third week increase the amount of beef scrap till it reaches about 15 per cent, and also the proportion of corn meal if the ducklings are to be fattened for market.

Brown Droppings

Lately my hens' droppings have been brown, some light, some dark brown. They are White Leghorns, and last month their production reached nearly 60 per cent. I feed scratch feed at 7 a. m., alfalfa at noon, whole barley at 5 p. m., dry mash before them all the time.—H. B. B., Inglewood.

Your hens are feeling the effects of heavy feeding through the winter. The best thing to do is to make the mash a little lighter by adding bran. You can tell by experimenting just how much is needed to make the droppings normal, and no harm will be done if you add more than necessary. Be sure the hens have all the greens they will eat.

Worms

What is the best remedy for worms? —Subscriber, Lugonia.

If you mean the common round worms which generally infest the intestines of fowls, mix 1 pound tobacco dust in 50 pounds dry mash, and keep before the birds three or four weeks. Then remove the same length of time, and repeat again for three or four weeks until worms disappear. Remedies for tapeworms are given elsewhere in this column.

Cripples

What is the cause of chicks coming from the incubator in a crippled condition?—Mrs. K. B. H., Redlands.

Cripples are caused either by insufficient airing of eggs or by the heat running too high at hatching time. The fact that nearly every large hatch contains a few shows that the heat is not quite evenly distributed. Some eggs get a little more than others, and the chicks come out with crooked feet.

Feeding Turkeys

How shall I feed my baby turkeys which are cared for by chicken hen?—Subscriber, Nipomo.

The first feed, which is given when the poults are 48 hours old, usually consists of chopped hard boiled egg, very stale bread, and green feed

Sick Baby Chicks?

Germozone operates just as these people say. It is preventive as well as curative, and satisfaction is absolutely guaranteed. Twenty years on the market. Sold by drug and seed stores at most towns.

Wm. E. Shepherd, Scranton, Pa., wrote—"Two weeks after we started last spring we were a mighty discouraged pair. Every day from three to six chicks dead. A neighbor put us next to Germozone and we are now sure if we had had it at the start we would not have lost a single chick." Ralph Wurst, Erie, Pa.—"Not a case of white diarrhoea in three years." C. O. Petrain, Moline, Ill.—"I never had a sick chick all last season." Mrs. Wm. Christiana, Olive Ridge, N. Y.—"Have 800 chicks now 5 weeks old and not a single case of bowel trouble."

GERMOZONE is a wonder worker for chicks, chickens, pigeons, cats, dogs, rabbits or other pet or domestic stock—for roup, bowel trouble, snuffles, gleet, canker, swelled head, sore head, sores, wounds, loss of fur or feathers.

If no dealer, order by card. Postman will collect. No extra charge. Handy as phoning. 75c and $1.50 pkgs. Baby Chick Book FREE.

Manufacturers and Coast Distributors, Long Beach, California.

(onion tops, alfalfa, dandelion, lettuce) mixed or ground together with a little chick grit or sand added. This is fed three or four times daily at first, care being taken not to feed enough to satisfy the birds. Change gradually after a week or so to rolled oats and greens. Some turkey people continue the egg a month or so. Some give cottage cheese or clabbered milk. The main thing is not to feed too heavily. Be particularly careful not to let the hen feed them. She would soon kill them.

STORRS EGG LAYING CONTEST

Storrs, Connecticut, February 28, 1921. Report for week ending February 27;

In the seventeenth week the hens in the egg laying contest at Storrs produced 3,582 eggs, or a yield of 51.2 per per cent. Of this total the 470 heavy breeds laid 1,721, or a yield of 52.3 per cent. The 530 light breeds laid 1,861, or 50.2 per cent. The average egg production for each bird in the contest was 3.7 eggs for the heavy breeds and the average production for the light breeds was 3.5 eggs. The increase in egg production over last week was 215 eggs, 78 eggs more than for last year for the same period and 369 eggs more than for the six year average.

The best pen for the week was a pen of Rhode Island Reds owned by Charles H. Lane, from Southboro, Massachusetts, with a production of 53 eggs.

The four leading pens in each of the principal varieties are as follows:

Barred Plymouth Rocks

W. H. B. Kent, 586 eggs; Rock Rose Farm, 478; Ernest W. Picker, 478; Oregon Agricultural College, 371.

Rhode Island Reds

Charles H. Lane, 623; F. S. Chapin, 574; H. S. Bickford, 572; Deer Brook Poultry Farm, 546.

White Leghorns

James O. Le Fevre, 574; A. P. Robinson, 555; Lion Head Poultry Farm, 524; Hollywood Farm, 503.

Other Varieties

Obed G. Knight (White Wyandotte), 653; H. P. Cloyes (Buff Wyandotte), 479; A. E. Hampton (Black Leghorns), 337; Oregon Agricultural College, 310.

THE MARKETING GAME

"The placing in the consumers hands of a little the best product to be obtained in any given line can only be accomplished by cooperation all along the line from producer to retailer, and if we are to secure for our members a maximum return it means greater care in handling by every one," is the opening paragraph in the last market letter sent out by the executive committee of the Poultry Producers of Southern California. It further says:

"To that end we are planning for a more careful handling of our empties at the station, more rigid specifications in purchasing all case material and increased care and inspection in putting up our pack.

"That the members may contribute their share to our campaign for 'better eggs,' we have rewritten our 'Suggestions to Shippers.' We also have these suggestions printed on heavy cardboard—one side only—so they can be tacked up over your candling bench, and we will be pleased to forward a copy to any member requesting same.

"Let us one and all do our part in an attempt to give to the consumer a quality that will result in increased demand for our product and so help at both ends of the line.

"As to washed eggs, we have explained before that anything which removes or breaks the albuminous protective covering on the outside of the egg shell opens the door to contamination and thereby spoils that egg for storage purposes.

"When candling and grading eggs for storage it is not always possible for the candler to detect the washed egg, hence should we permit washing of any eggs during the period we are placing eggs in storage we run the risk of deteriorating our pack to that extent.

"By being able to assure our customers that absolutely none of our shippers are allowed to wash their eggs, we secure greater confidence in our pack and to that extent are able to return more to the members for their entire product than would be the case with a few washed eggs coming in and so lowering the reliability of our storage stock.

"Members will, therefore, watch out for the colored slip to be mailed in the near future, giving notice to discontinue washing and thereafter ship their eggs just as gathered, but segregating the dirty eggs by themselves."

Layne & Bowler Pumps Irrigate Prosperous Ranches

No ranch can have the insurance of prosperity without the protection of a dependable water supply. On more than 7,000 ranches Layne & Bowler Pumps are helping keep ranchers prosperous. Among those who prefer Layne & Bowler Pumps are included Wylie M. Griffen, Pres. of the Calif. Raisin Growers Association; C. C. Teague, President of the Calif. Fruit Growers Exchange and the Calif. Walnut Growers Association; Goodyear Tire & Rubber Company, Pacific Gas & Electric Company, Sacramento Valley Colony Company, Salinas Land Company and U. S. Indian Service.

The Eugene Kimball Ranch, six miles east of Ventura, California, is irrigated with water produced from a Layne & Bowler Heavy Duty Full Floating Direct Connected Pump illustrated here. Mr. Kimball also uses the pump for supplying water for domestic purposes, storing the water in the tank shown in the background.

Write for illustrated, descriptive Folder No. 30. Layne & Bowler Pumps are made in sizes to go in wells 10 inches or larger in diameter. Capacities: 180 to 4500 gals. per minute. We shall be pleased to send a field man to your property to discuss with you the cost of installing a new pump.

Carrots: Doz., 25@35; sk., 1.00@1.25.

Cauliflower: Supply moderate, field cr., best, 2.00@2.50; poorer, 1.00.

Celery: Field cr., 3.00@3.50; poorer, 2.00@2.50.

Cucumber: Hothouse, best, 2.00@2.50 dozen.

Lettuce: Local field cr. mostly 50@1.25; best mostly 1.00@1.25.

Peas: Supplies liberal, market firm. Imperial Valley, quality good, 12@14 per lb.; poorer, 8. Local, best 12@14 per lb.

Radishes: 15@17½ doz.

Rhubarb: Crimson Winter, best bx., Rhubarb: Crimson Winter, best bx., 1.85@2.10 poorer, 1.75; Strawberry, 4.50 @5.00.

Spinach: Doz., 15@20.

Squash: Local Hubbard and Banana, lb., 1½@2; Summer, 2.75@3.00 cr.

Tomatoes: Mexican, per lug, original 3.00; repacked lug, 3.50@3.75. Much poor stock at wide range in prices.

Turnips: Per doz., 25@35; sk., 90@1.10. @1.10.

CITRUS FRUITS

Grapefruit: California, per box, market pack, 2.00@2.50; special packed brands, 2.50@3.25; Imperial box, 4.75@5.25; small

Lemons: Market dull, wide range in prices: Local stock: Packed, box, 1.50 @2.25, few high as 3.00; loose, bx., 75@ 1.00; lug mostly 40@50.

Oranges: Supplies heavy, market dull. Navels market pack large size 2.75@ 3.25; small low as 1.75; special brands small sizes 2.75@3.25 large 4.25@4.50; packing house culls, 25@85 box; few large size 1.00. Tangerines, best, 6@7 lb., small, 4.

HONEY

Conditions very unsettled. Market very weak and prices lower. Practically no carlot sales are being made at this time. F. o. b. usual terms, quotations range in 60-lb. cans White Orange Blossom 12½ @13½; White Sage, 12@14; White Alfalfa 9; Light Amber Alfalfa, 6¾@7½; Light Amber, 8½@12; Hawaiian White, 7½; Light Amber, 6. A large percentage of honey shipments are now going out in small containers rather than in the customary case holding two cans of 60-lbs. each. One, five and ten pound glass jars and 2½ lb. individual containers are all being used with a movement which though slow, is better than that on bulk goods. Most shipments are going to Eastern markets to be sold by brokers in less than carlots. Sacked beeswax of good clear color is priced in less than carlots at 33@35 per lb.

WALNUTS

California Walnut Growers Association's prices: Soft Shell, No. 1, 22½; Soft Shell, No. 2, 16½; Budded, fancy, 26½; Budded, standard, 22½.

GRAIN AND FEEDS

Grain Exch. price bid March 15:
Milo: Eastern No. 2 bulk, 1.62½@1.72½.
Eastern Kafir: No. 2, 1.55.
Barley: 1.30@1.32½.

HAY

Alfalfa Growers of California report under date of March 15:

Receipts of alfalfa hay showed a further reduction during the week and were easily taken care of by the demand for immediate consumption; the smaller arrivals graded proportionately the same as during the past weeks, that is a relatively large percentage consisted of lower grades, forcing buyers to fall back on these to some extent in substitution of the higher grades, of which the supply was limited. The market was steady throughout the week, with prices practically unchanged, while during the same time the markets for grain and other feeding stuffs suffered further sharp declines and closed at the bottom at the end of the week.

There were 560 tons received on the Los Angeles tracks the week ending March 12, with 190 tons held over as against 1,320 tons received the week before.

Rabbit Alfalfa	36.00
No. 1 Dairy	24.00
Standard	21.00
Stock	16.00

Quotations by Nichols-Loomis Company. Following are prices to growers f. o. b. Los Angeles in carload lots; handling and commission must be added to obtain retail prices on new hay:

HAY

Alfalfa Growers of California report under date of March 15:
There were 1,245 tons received in San Francisco.

No. 1 Dairy	20.00
Standard Dairy	18.00

Under date of March 12, A. W. Scott Co. says:
Receipts past week 1,245 tons. Although receipts continue heavy, prices have held up. Business generally has been better and there has been more life on the market than for some time. We do not look for any raise in prices, as at its best our probable demand will only consume the visible supply. While farmers still complain that these prices do not give them net returns sufficient to cover the cost of production, nevertheless there seems to be a general sentiment that it is just as well to sell hay now as later, and that not much will be gained by holding any longer through the season. Throughout the interior movement is good, trading has been more satisfactory and in greater volume than for some weeks. Export trade has been extremely light, the governm being practically our only customer in any quantity. Coastwise shipments have been a little more active and helped the general demand. Alfalfa has been doing the worst of any of the hay grades this week. The supply has exceeded the demand and some sales are reported at slightly reduced figures, although the market closed at the end of the week at normal levels.
We quote today wholesale prices in carload lots as appear from dealers' transfers upon the hay market in San Francisco (for prices to consumers, charges of switching, cartage, commission and handling expenses must be added according to conditions).

Wheat Hay, fancy	20.00@21.00
Wheat Hay, light 5-wire bales	17.00@20.00
Tame Oat Hay, fair to choice	17.00@19.00
Wild Oat Hay	12.00@15.00
Barley Hay	12.00@15.00
Alfalfa Hay	17.00@20.00
Stock Hay	10.00@14.00

Citrus Markets

Los Angeles, March 16, 1921.

The orange situation is fair. No long prices are being received but there is a continued demand which is keeping the market fairly clean. Picking was stopped a few days, but packing houses are now in full swing again.
The lemon market is dead.

Shipments

Shipments of citrus fruits to date since November 1, 1920, Southern California: Oranges, 10,668 cars; lemons, 2,320; total, 12,988. To same date last season: Oranges, 10,566; lemons, 2,195; total, 12,761. From Central California to date, this season: Oranges, 4,305; lemons, 112; total, 4,417. To same date last season: Oranges, 3,495; lemons, 264; total, 3,759. From Northern California to date this season: Oranges, 305; lemons, 5; total, 310. To same date last season: Oranges, 261; lemons, 22; total, 283.

POTATO PLANTING

Potato planting in the San Gabriel and San Fernando Valleys and southern districts in general was completed nearly a full month earlier this spring than for the first crop of 1921. Last year light but continuous rains deferred planting until too late to insure good crops. This crop deficiency was particularly noticeable in British Queen as far north as Bakersfield, resulting in many acres of the later plantings not being dug, the value of the crop not being equal to that of the labor necessary. This year the growers are jubilant over the early planting and are unanimous in the opinion that promise of heavy yields is likely to be fulfilled.
Geo. H. Peters of Bakersfield and R. G. Risser of the Sacramento office of the California Vegetable Union were interviewed and stated planting throughout has been early this year, last year's late planting proving a severe lesson. Mr. Peters stated his planting was finished the first week in March, or earlier than that general in the Los Angeles district. Mr. Risser has recently visited the San Joaquin and Sacramento Valleys and reports early planting and conditions favorable to a bumper crop.

RIPENING OF AVOCADOS

Of the five varieties officially recommended for planting, we give herewith the season of ripening, the weight, shape and color of each. Fuerte, January to April, 10 to 16 ounces, pear shaped, dull green. Spinks, March to October, 16 to 20 ounces, egg shaped to pear shaped, purplish black. Dickinson, May to September, 14 to 20 ounces, egg shaped to pear shaped, dark purple. Sharpless, September to January, 16 to 20 ounces, pear shaped, dark purple. Puebla, November to January, 6 to 14 ounces, pear shaped, dark purple. Fuerte is a cross between the Mexican and Guatemalan type; Spinks, Dickinson and Sharpless are Guatemalans (hard shells); Puebla is a Mexican (thin skin).

JAPANESE LACQUER TREE

It seems highly probable that California will some day grow Rhus vernicerfa, the lacquer tree. Climatic conditions are favorable and all sumacs thrive here for we have several native species. Its sap production is of considerable value but on the skin of some persons produces the same eruptions as the closely related poison sumac, known locally as poison oak or poison ivy. The bureau of plant industry at Washington, which has distributed seeds of the tree, thus describes it and its uses:

"A slender branched tree with winged leaves, attaining a height of 20 feet. It is common throughout Japan and is cultivated for its sap which flows from stem and branches on being wounded. It is first cream colored, but on exposure to the air soon turns black and is the varnish which the Japanese use for lacquering their furniture or ornamental articles. The varnish or lacquer is valuable because of its great hardness without brittleness or becoming cracked; its high luster and mirror like surface which remains untarnished for centuries; its resistance to the agencies which attack resinous varnishes, as it is not injured by boiling water, hot ashes, hot alcoholic liquors, acids, etc. Unlike ordinary paints which dry because of oxidizing properties of the oil in them, this Japanese lacquer dries better in moist than in dry air as the result of a supposed enzyme which acts upon an albuminoid in the presence of a vegetable acid and a gum. The industry is one well worthy the serious consideration of paint manufacturers."

POTATOES ABOVE AND BELOW

In Paraguay grows a wild potato, a variety of the common Solanum tuberosum, but more of a vine, that bears potatoes both above and within the soil. An American visitor thus describes it: "It will stand frost equal to tomato vines. The tubers above ground are very similar to potatoes, but the color is dark, from yellow to red. There are also white tubers below the ground, the same as regular potatoes, but very small. It may be possible by selection and crossing to induce plants to bear marketable potatoes, both above and below ground. It is not as heavy a cropper as the regular potato and the necessity for a trellis makes its economic value doubtful."

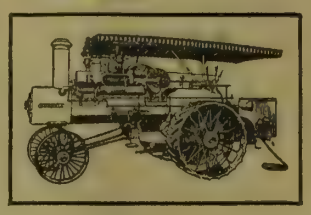
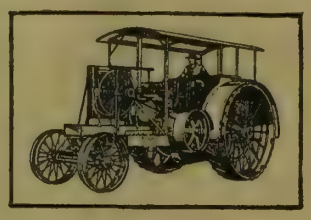
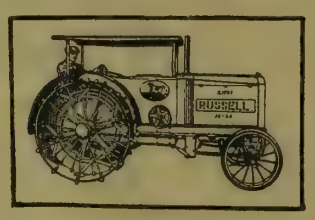
RUSSELL MACHINES are PEDIGREED

Like blooded live stock, they are the result of painstaking selection and steady improvement over many years.

Russell Threshers combine 79 years of constant try-out and development in actual service. Russell Tractors, first made in 1875—several years ahead of any other, are still *first* in Reliability, and years ahead in proven good features.







How Russell Machines Stand Up

"Our Russell Thresher was purchased by James Reese and Geo. Greer from you way back in 1865. It did the threshing for the whole neighborhood up to 1870, then was sold to Chandler Bros., and still remains with the undersigned. It has done more or less work every year and is today doing good work" — J. L. and FRANK CHANDLER, Lisbon, O.

"I purchased my Russell Tractor from you second hand in 1914; I don't know how long it had been used when I got it, but it is just as good as ever and runs fine. I have only spent an average of $20.20 a year for repairs and have certainly had good results. Have had the very best success burning kerosene" — W. G. HARTUNG, Newport, Minn.

"My old Russell Traction Engine No. 3404 was built back in 1886; it has been in use ever since and is still doing good work for me every season. It has plenty of power and my repair bills have been very small, considering the length of service with this outfit."—JOHN VOGEL, New Sheffield, Pa.

"I bought my Russell 12-24 Tractor in 1917 and have used it more in four seasons than most people do in ten; it pulls three 14-inch Oliver plows in Buffalo sod, black land very satisfactorily and will pull three 14-inch plows on old ground almost any depth . . . . I have farmed 500 acres for the past three years and have sold all my horses and farm these 500 acres with my tractor. I find it 50% cheaper than using horses."—F. IVAN TINSLEY, Canton, Kas.

YOU can have the SAME SERVICE by using the SAME MACHINES—*RUSSELL*

Russell Tractors in 4 sizes; Russell Threshers in six sizes including the 20x34 for individual use; Russell Steam Traction Engines in five sizes.

A Russell for every size farm. *Send for the New Russell Catalog.*

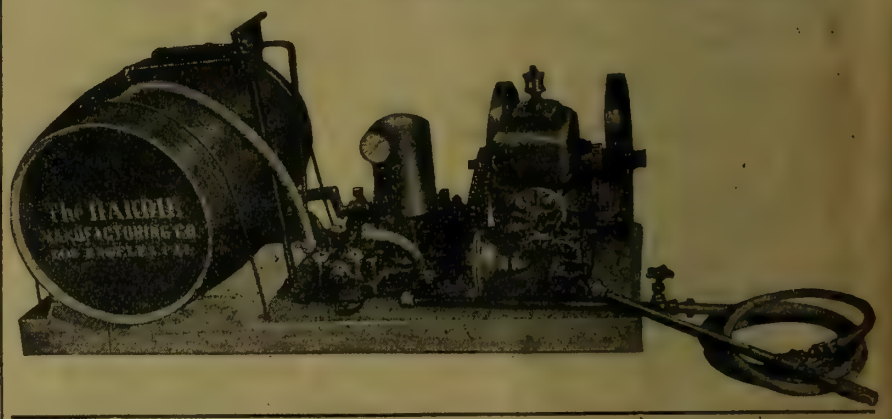
No. 1000 BABY JUNIOR



SIZE OF PLUNGER 1⅝ IN.	LENGTH OF STROKE 5 IN.	HORSE-POWER 1½ MAGNETO IG.	SPEED OF PUMP 60	CAPACITY 4½ GAL. PER MINUTE	WOOD FRAME	WORKING PRESSURE 225 LBS.

Our Special for Small Orchardists

can't be beat. It has been said that this Hardie Junior is the "biggest little power sprayer" on the market, big in everything except price.

This Hardie Junior Power Sprayer is in use in every fruit section of America, and our records will show that this machine is making a wonderful record. For satisfactory service and low upkeep cost it its very low price makes it available to the small grower who has thought he could not afford a power sprayer. In fact, thousands have seen in this Hardie Junior Power Sprayer their opportunity to get away from the hard work of hand pumping and the inefficiency of low pressure hand spraying.

SPECIFICATIONS.

1. Engine 1½ h. p. HARDIE Magneto ignition.
2. Pump—Famous HARDIE Junior pump.
3. Tank—50 gal. barrel, fitted with mechanical agitator.
4. Regulator—HARDIE relief valve.
5. Drive—Steel roller block, chain running on steel cut sprocket.
6. Equipment—25 ft. HARDIE best spray hose fitted with "Stay-there" hose clamp, one angle cut-off, one Vapo nozzle, one 10 ft. bamboo spray rod.
7. Price—$270.00 F. O. B. Los Angeles.
8. Weight—500 lbs.
9. Hardie Gun instead of rod, add $5.00.
10. Truck—add $60.00.

One Little Nook at Santa Clara Blossom Festival Time

It was our privilege to attend one of the very first of Santa Clara Valley's blossom festivals. It was many years ago but the memory is still fresh. Some of the prune orchards are located on the floor of the valley, but there are enough of the orchards over the hillsides to make one of the most striking of scenes. In the larger orchards the wide spreading branches cover practically all the ground so that even the roadways scarcely make a break between the trees glistening white. The beauty of these hills down the valley from San Jose and about Los Gatos, Saratoga, Congress Springs, Edendale, Morgan Hill and almost to Gilroy has been so exquisite that the world has been invited to come in and help observe the spring time blossom festival. This year's festival has been held during the past week. The valley gave the following invitation to the world: "Santa Clara Valley, in springtime the most radiant spot on the earth, holds at this season a Blossom Festival, to which it invites you. On fragrant hillsides, overlooking a vast bowl of blossoms, the festival is held yearly, a spontaneous gathering of the people of the valley, to drink in the beauty of mile upon mile of orchards. Double purpose gathers the dwellers of this rare region at this modern Festival of the Golden Bough. Not only do the peoples delight in the prospect of this stormless sea of dainty white and pink petals of the present spring day, but they glory in the promise of the harvest that the blossoms predict, for the floral wealth of March and April becomes the fruit of summer and fall, and from this Valley go forth to all the world the golden and purple trophies of the trees." The scene above is taken from the hills near Los Gatos.

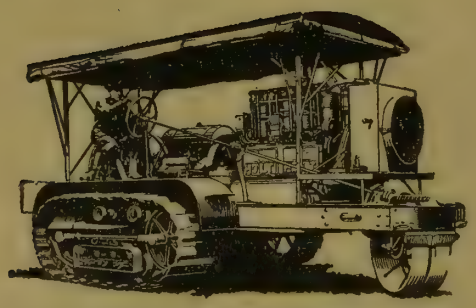
For consistent, continuous, low-cost tractor performance, this quality is essential-

DEPENDABILITY

It is the dependability of Holt construction, perhaps more than anything else, that has made the "Caterpillar" Tractor supreme in performance and in low operating and upkeep costs.

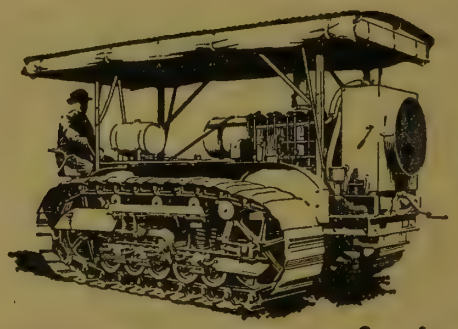
Ask any of the thousands of "Caterpillar" Tractor users why they have made this tractor their choice. Ask the owners of fleets of "Caterpillar" Tractors why they have standardized on this machine. The answer will be—"Because the Holt product is absolutely dependable." This quality—the result of correct design, scientific choice of materials and careful, accurate workmanship—makes the "Caterpillar" Tractor able to do your work at lowest cost per horsepower-hour.

CATERPILLAR



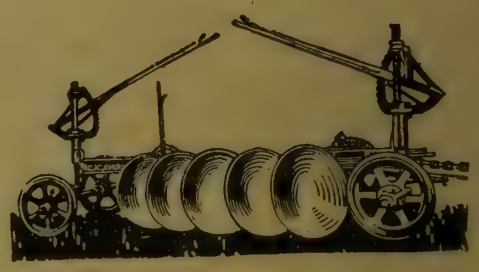
The "75"—the only tractor for your big power needs

"Caterpillar" 75 Tractor is the one and only tractor for big work—pulling a big harvester, land leveler or sub-soiler, or plowing deep—without danger of overloading, which causes 60% of all upkeep expense. The "75" stands supreme in power—the most powerful tractor on the market today. Yet, because of its economy and reliability, the operating and upkeep costs are exceptionally low—actually lower than of other tractors of considerably less horsepower. Don't underestimate your power needs; don't be handicapped with insufficient power—the "75" has ample capacity for your heaviest requirements.



The "45"—Famous for its compact power, versatility and economy

"Caterpillar" 45 Tractor is small in size but big in capacity for work. It is compact, easy handling, extremely versatile. Its hinged truck—an exclusive Holt feature—gives wonderful flexibility for working over rough ground, ditches, checks and levees. Big track surface makes the ground pressure, per square inch, exceptionally low. Besides the standard model, the "45" is offered in a special orchard model that makes particular appeal to the orchardist who wants a high-powered tractor for deep tillage and quick cultivation.



"Caterpillar" combination disc and moldboard tractor plows

A tractor can give no more consistent, continuous performance than the tools it handles will permit. That's why we developed a tractor-plow that will give the same trouble-free service as the "Caterpillar" Tractor, uninterrupted by annoying and costly delays. "Caterpillar" Plows, moreover, are light of draft and, because of their exclusive four-wheel construction, adaptable to widely varied conditions of soil and work. The standard frame can be equipped with discs or moldboard bottoms or heavy tractor chisel points.

Tariff on Lemon Products

THE big meat packers maintain that they make absolutelv no profit on meat. For the time being we will grant the claim, though we confess to a degree of skepticism as to the real foundation for such a statement—referring now to meats and meat products. We have seen so many times where a commission appointed to investigate, instead of investigating has resolved itself into a judicial body to hear evidence which may be brought before it. In the packer investigation the case for the packers was logically and shrewdly presented by the ablest attorneys and was most convincing that there was no profit anywhere. The case of the producer and the consumer, on the other hand, had neither intelligent nor just presentation. The commission "investigated" sufficiently and rendered its judicial decision.

But, as noted above, for the time being, we will admit the truth of the statement that wastes save the day and apply the lesson to the present lemon situation. With lemons the wastes have not saved the day, because the wastes have not been saved at all. There have been no by-products. The prices received until nearly three years ago were sufficient to justify wasting the wastes and depending upon the high grade lemons to maintain the industry. That day is now past, and until the thousands of tons of cull fruit can be turned into one of the two principal by-products of the lemon industry, lemon oil or citric acid, there will be no profit, and unless there is profit the industry will perish. The lemon growers feel that one of the steps toward saving the industry is the securing of a protective tariff on lemon oil and citric acid which will give a margin that will justify American manufacturing chemists in establishing factories to handle these by-products.

We referred last week to a brief Argument on The Lemon Industry of California by the lemon growers of the state and we now note figures from the same source giving an idea of profits on the Mediterranean fruit and the possibility of profits to the California lemon grower which may be made to save the industry.

Some Items of Cost

A ton of fruit costs the grower to grow it 2½ cents a pound, amounting to $50 for a ton. It costs to pick and haul it to the factory over $10 a ton; it costs to manufacture it into lemon oil and citric acid $17.52 a ton (see Products Brief), but we deduct $2.79 as we can have processing plants within hauling distance if we use all grades of fruit, leaving the cost of processing $14.73, making a total of $74.53, the amount the Products Company must receive for the lemon oil and citric acid from a ton of lemons in order to pay the growers 2½ cents a pound for the lemons on the tree. At the present time Italy is receiving $94 for the oil and acid from a ton of lemons, in their money.

The recent highest price obtainable for lemon oil, i. e., 80 cents a pound, less the present tariff of ten per cent ad valorem, makes the price unaffected by the tariff 72 cents a pound. A 220 per cent ad valorem tax based on 72 cents value would amount to $1.58 a pound and added to the 72 cents would give a price of $2.30 a pound. The oil from a ton of lemons, 6 pounds, at $2.30, would bring $13.80.

The present price of citrate of lime in Italy is 16 cents a pound, our money, from that we conclude that the present price of citric acid in Italy is about 32 cents a pound. Add to this a tariff of $1.20 a pound, and it would make a price of $1.52 a pound. The citric acid from a ton of lemons, 40 pounds, at $1.52 a pound would bring $60.80, which demonstrates that, on the basis of present prices, if a tariff of 220 per cent ad valorem was levied on importations of lemon oil and $1.20 a pound on citric acid and those tariffs increased the prices obtainable for the products, the full amount of the tariff, the Products Company would receive $74.60 for the oil and acid from a ton of lemons and would be able to return to the growers 2½ cents a pound for the lemons on the trees.

The result would most assuredly fall below that mark a Italy has not said the last word in the line of price cutting when she is returning her lemon growers 4 1-5 cents a pound for the fruit while selling the acid at the present price, 32 cents a pound.

Also the above ad valorem figures are based on the highest price recently obtainable for an average grade of American lemon oil and should be based on the Italian price for a similar grade of oil. The Italian price is undoubtedly lower and that would make 220 per cent ad valorem not enough to secure the end desired.

Whatever cuts are made in the Italian profits will come out of our growers' returns of 2½ cents a pound.

We plan to send all grades of fruit in certain localities to the products plant as Italy does.

Importance of Duty

If we can not have both the duty of three cents a pound on fresh lemons and the full duty asked herein on lemon products it would be better for the industry to cut the duty on fresh lemons to two cents a pound and levy the full duty asked on the lemon products. The full duty asked on lemon products is of the greatest consequence to us. These figures are made in all seriousness and not with allowance for paring down. They are not high enough to produce the result sought, 2½ cents a pound for the fruit on the tree.

Not a Local Case

The lemon industry is not alone in its distress. It is one of a host of industries large and small all over the nation that are now fighting with might and main the tidal wave of foreign competition that will surely engulf them if they receive no succor. It is of vast importance to each of them and to all the industries of the United States that all industries be kept going. A little export or import business is as nothing compared to a lively domestic trade.

Europe can not pay us what she owes us in gold. She can only pay it by doing for us and furnishing for us the things our people should do or furnish for each other. If we permit her to do these things for us it will curtail the operations of our industries, causing widespread unemployment and distress here. It would be better to forget about those debts than to let Europe beat us in this big trade.

California lemon growers have been spending $300,000 a year in advertising and special dealer service work in an effort to increase lemon consumption in the United States. The importers of Italian lemons have reaped a share of whatever benefit accrued from this expenditure. The Italian lemon growers dominate the world's traffic in lemons and lemon products but have made no corresponding effort to increase their sales of lemons and lemon products to the thousands of millions of people living outside the United States. It is only reasonable that they should be compelled to develop those other markets for their lemons.

In 1909 when our committee asked the Republican ways and means committee to levy a tariff of 1½ cents a pound on imported lemons it stated, "under the stimulus of an increased duty the setting of lemon trees would be so great that in ten or 12 years California would produce all the lemons consumed in the United States." The duty was increased and the promise has been fulfilled.

Suggestions to Shippers

IF your organization is to succeed in placing your products in the best markets at the highest prices it must be done by giving the buyer a better pack than he can obtain elsewhere.

This means that our grading must be strict and uniform and the interior quality of the eggs of the very highest.

We can then command the confidence of buyers anywhere and be assured of permanent business at remunerative prices.

To produce an egg that will fulfill the above conditions we must begin with the hen. Producers should see to it that their birds are healthy, strong and vigorous; that they are well housed—not overcrowded; that all surrounding conditions are sanitary, and that every hen is given the best of care.

The item of feed is most important and should always be closely watched to see that nothing but sound, clean grains are used, and that the mash should be compounded from simples of first quality, free from any material that might contribute to deterioration of the eggs when in cold storage. A freshly laid egg, produced by a healthy hen, is a perfect food product, but from the instant it is dropped into the nest it is subject to influences which tend to impair its quality and therefore reduce its value.

Causes That Reduce Value of Eggs.

Dirt, heat, wetness and also excessive dryness are the principal enemies of quality in the fresh egg. Dirt directly affects the appearance of the egg, making it unattractive to the buyer. It also brings into close contact with the egg mold germs and other undesirable bacteria which tend to spoil the contents. It frequently imparts an unpleasant flavor.

When an egg gets wet the albuminous protective covering is dissolved, allowing the bacteria of decomposition free access through the pores of the shell, causing the egg to spoil rapidly.

Heat breaks down the albumen or "white," making the egg "weak" or watery. It has the contrary effect on the yolks, making them dark and "heavy" and undesirably high colored. Weak eggs and eggs with dark, heavy yolks are classed as "baker" eggs. In fertile eggs heat starts incubation (which begins at 70 degrees), causing "blood rots."

When eggs are exposed to a drying wind or draft of air the contents evaporate quite rapidly, causing "shrunken" eggs. The grading rules provide that "extra" eggs must be "full," therefore shrinkage reduces the quality and causes the egg to be graded as a "first" or a "baker's" egg, according to the amount of shrinkage. Many people seem unaware of the extent to which fresh eggs will shrink in a few hours when exposed to a dry wind. If the weather at the same time is hot, the egg so exposed will almost inevitably become a "baker," even though in point of time a fresh laid egg.

Proper Care of Eggs

The above considerations suggest their own remedies. In order to preserve the fine quality of the new laid egg, the nests should be located so that they are protected from direct sun rays and from wind.

Nests should be kept strictly clean and well supplied with dry, odorless nest material. Laying house floors and yards should at all times be reasonably clean and the floors always dry and covered with litter or sand.

Eggs should be gathered twice a day, especially in hot weather. They should be put at once into cool room or cellar,

OUR ADVERTISERS RELIABLE

We guarantee our subscribers against loss through dishonesty of any advertiser in the Cultivator. We do not attempt, however, to adjust trifling differences between subscribers and honest, responsible advertisers, nor will we pay the debts of honest bankrupts. Notice of complaint must be sent us within 30 days from date of the transaction, and the subscriber must have mentioned the Cultivator when writing the advertiser.

If any of the 40,000 Cultivator subscribers fail to find any article they desire to purchase advertised in the Cultivator's columns, a special request is extended you to let your wants be known to the California Cultivator and we will place you in touch with proper parties.

EDITORIALETTES

Almost any section of California gives a view these spring blossom days which is ample recompense for a long trip. Our cover illustration this week gives only a slight indication of some of the beauty amongst the prune orchards of the Santa Clara Valley. The Blossom Festival is over but the beauty still remains, though it is rapidly changing to a rich green.

* * *

Now comes the Date Festival. The Coachella Valley, the "low-down" section where dates grow, has scheduled a great festival to be held October 21-23, 1921. It is a festival to chronicle the joy of the people of that valley in growing the finest dates in the world and in addition to give a bit of advertising to a product which is already coming in such quantity that soon larger markets must be developed.

* * *

The farmer of the East, or rather of the entire Cornbelt, is saving out some of the corn which he was burning because of its not bringing in sufficient to buy fuel, and is sending it to hungry children overseas. The farmers' contribution has been supplemented by the offer of railways to carry the corn without charge. The railways' offer has been supplemented by that of their employes to give their services in the transportation of the corn without charge; the big commercial corn shellers have made no charge for shelling; elevators have stored and loaded on trains without charge; and from start to finish there has not been a penny of expense to put the corn in the hands of hungry Europe.

* * *

It may be that the income tax is vicious and that many exceptionally rich people engaged in manufacturing or mercantile lines have simply added enough to their prices to meet the excess profits tax, but they can't all do that. The savings organization of the twelfth federal reserve district reports that it is roughly estimated that one man, John D. Rockefeller, has a gross income of some $43,000,000. Under the excess profits tax something like two-thirds of this goes to the government. Gasoline may be marked up to meet this, but not all.

* * *

It is now reported that there are about the same number of idle men as were drawn into the service during the great war. Still the immigrants are coming by the thousands and without the slightest hindrance.

* * *

The date for the university farm picnic has been fixed; it is Saturday, April 23. This annual event at Davis has attracted from 12,000 to 15,000 people every year for the past dozen years. It is more or less of a festival occasion and results in an all around good time and at the same time gives opportunity to farmers within automobile reach of Davis to learn as to the very latest in scientific agriculture.

* * *

"Sensible Optimist" in the Rural New Yorker suggests to a worried and discouraged farmer: "Do not unload anything. Hang on 'like a pup to a root' and grab more. 'Better bear the ills you have than flee to others' that will surely get you. This condition affects everyone, but least of all the farmers. Only 50,000 auto workers at Detroit, instead of 300,000. Census of Akron now 100,000; was 200,000. Farmers have only lost $5,000,000,000, but have stamina yet to kick like everything. Try that kind of a loss on any other industry, try it on any two, and they will be dead as Balaam's mule."

We don't know how dead Balaam's mule may be by this time, but he isn't much deader than the possibilities for a living through farming as conducted by some farmers in this year 1921. A year ago almost any type of farming could be made to yield a living and some profit to the farmer; today only the shrewdest of management and most persistent stick-to-it-iveness can win. "Optimist" may be justified in his optimism, though we note he closes his suggestions with: "Our planting this year must be done temperately with an eye to maximum yield and minimum acreage.

"Prosperity will come when the farmer gets profitable prices for his yields and buys things. The alleged enormous crops will prove mythical, and they will hasten the day they can buy things."

* * *

President Howard of the American Farm Bureau Federation asked regarding the former congress: "Will the house leaders allow the packer control bill to come to a vote?" His question was answered by a very loud silence in the negative. Maybe the special session will think differently; meantime practically all organizations representing farmers; the National Consumers League, the League of Women Voters, the American Federation of Labor, are making audible protests which indicate that something will drop if this matter of packer control is not attended to.

* * *

The California Bud Selection Association is not dead nor inert, notwithstanding the papers are saying but little regarding it these days. The foundation is being laid for an association which will mean much to California fruit growers.

* * *

Santa Clara Valley Japanese have accepted the American cooperative idea in both theory and practice. Japanese vegetable and fruit growers of that valley have now organized and purchased a large canning establishment which will handle their surplus. Strawberries will be one of the principal products.

MORE EFFICIENCY

The California Tractor Association and the Southern California Tractor and Implement Dealers Association have both voluntarily terminated their existence. This has been brought about partly in the interests of economy and to make possible reorganization in a single association. The membership of the two associations was in many cases identical, that is, members of the northern association were also members of the southern association because of having distributing houses in both centers. It costs a vast sum of money to stage a farm power and farm implement show. Two great shows were staged in this state during the past year, one at Verdugo in the outskirts of Los Angeles, and one during the state fair at Sacramento in September. Presumably arrangements will be made for a great exhibit at the coming state fair and very probably an exhibit will be made in conjunction with the livestock show at the sixth district fair, Los Angeles, though this is not definitely arranged. But it is probable that if these two exhibits are staged they will be largely under the direction of one association and at less expense than the shows of the past. The demand was never more insistent for efficiency and labor saving appliances than it is today, and our implement dealers and manufacturers of farm power will in no way lessen their efforts to meet the need of the farmers.

TRADING IN "FUTURES"

The believers in gambling as carried on in the Chicago board of trade are making strenuous effort at this moment to show the benefits derived from the transactions in the pits. They are trying desperately to befuddle the public mind as to the curse of this gambling to the consumer and the fearful loss to the farmer. It is asserted that less than 28 hundredths of one per cent of the number of bushels of grain bought and sold on the board of trade is actually available for delivery at Chicago. In other words, over 99 per cent of these "sales" on "futures" are never followed by delivery of the grain. There are sold approximately 18,500,000,000 bushels on futures market annually (more than three times the grain production of the world). The value represented in this vast quantity of sales is around $20,000,000,000.

Many years ago when the Louisiana lottery aggregated $60,000,000 annually, which it fleeced from the dear people, we thought we had reached the limit and wiped it off the face of the map, at least so far as the United States was concerned. And there is Monte Carlo at which we hold up our hands in horror. But all these great gambling schemes combined do not make a start toward competing with grain gambling in the injury caused to the people of this country.

In making an address concerning the proposed tax on "future trading" before the house committee on agriculture, Clifford Thorne, general counsel for the American Farm Bureau, summarizes the situation in these words:

"If a purchase and sale of grain consummated by parties who do not have any grain to deliver on the contract, and who do not want to receive any real grain, who do not expect to have any grain delivered or received, and who, in more than 99 cases out of a hundred, settle their contracts by the payment of differences, is gambling, then we have demonstrated the fact that the Chicago board of trade is the greatest gambling institution ever seen upon the face of the earth.

"This stupendous speculative market constitutes our price determining machinery on grain. We object to certain phases of its present operations because the most important function of the entire institution is under the control and domination of speculators. The dealer in actual grain is completely overshadowed."

WORKING FOR THE FARMER

For the first time the farmers have a friend at court, in fact, several of them. These are organizations which have made headquarters at Washington, have kept tab on legislation, have promptly reported to the farmers the action of congressmen and have started a lot of things intended to be of real benefit to the producing interests, in fact, to the entire country. Unfortunately, there has been more of starting than of satisfactory finishing. But in any case we are getting a little bit of attention and have now risen to the dignity of being investigated. Congress seemed to get an idea that too great an amount of money was being spent on their lobby so a committee was appointed and made report in which the following appeared, as noted by the Indiana Farmers Guide:

"The representatives of the American Farm Bureau Federation, the National Grange, the National Board of Farm Organizations and the Farmers National Council were among those called before the investigating committee.

"The American Farm Bureau Federation is spending about $30,000 a year, paid from the treasury of the federation. Gray Silver, in charge of the office, receives a salary of $12,000 a year, and his assistant, O. M. Kile, is paid $5,000.

"The expenses of the National Grange amount to about $6,200 a year, coming from the Grange treasury. Prof. T. C. Atkeson, who has charge of the office, receives a salary of $3,000 a year.

"The National Board of Farm Organizations expends around $15,000 a year, this amount coming as contributions from 15 member organizations and from rent from a building which it owns in Washington. Chas. A. Lyman, the secretary, receives a salary of $3,600 a year.

"The Farmers National Council, which consists mainly of Geo. P. Hampton and Ben C. Marsh, spends about $16,000 a year received as contributions from three agricultural organizations, two individuals, and from the Fels Foundation, the Plumb Plan League and the All-American Cooperative Conference. Mr. Hampton's salary is $6,000 a year and Mr. Marsh's $3,600."

And we may be permitted to ask: "What's the harm?" We do not all agree with all of the aims of every one of these associations, but they are looking after the best interests of the farmer. The results which were not accomplished in the last session show that their work is not ended.

California's Wealth of Water

By J. L. Mathews of the State Water Commission

PRESIDENT CHARLES H. LEE of the state water commission, in his report to Governor Stephens for the biennial period just closed, says in figures that the commission has hundreds of times over paid its own way in the amount of new values created through the releasing of water rights upon lands that had never before been brought under water, or which were struggling with seemingly inextricable legal knots that tied up the rights to water.

The estimated area possible of irrigation in California is 9,669,600 acres, and the commission already has applications for water for a large proportion of this. The commission has issued permits for water for 618,400 acres. Possible water power development in the state is estimated at 9,250,000 horsepower, and applications for water rights have been received by the commission amounting to 5,590,000 horsepower. Permits have been issued amounting to 243,000 horsepower.

Financial houses are demanding that a showing of water right permit issued by the state water commission be made before lands can be given a loaning value. It has come to be accepted that a definite water right title is as essential in California as a land title, and is, of course, more essential for actual operation. This applies to riparian and non-riparian lands alike. It has come to be understood that a riparian right merely entitles the owner to a reasonable use in common with other riparian holders and that the amount of water to which they are entitled is vague, depending not only upon the stream flow, but upon the number of riparian owners. The right by appropriation and beneficial use, which is the method followed by the commission, entitles the owner to a definite amount so long as there is a sufficient amount of water in the stream to supply appropriators with senior priorities.

All unappropriated waters are subject to appropriation under the terms of the act upon which the commission is established. It is decidedly significant to know that there were but few permits for large projects issued in the biennium, but that the great total is made up very largely of permits to comparatively small land owners. Among the acreages upon which permits were issued is that of the Happy Valley Irrigation District operating 18,110 acres. The Natomas Company received permits to irrigate 14,510 acres; the Sutter-Butte Canal Company, 27,500 acres; T. B. Cross, 8436 acres in the Sacramento delta; San Joaquin Light and Power Company for the development of 63,636 theoretical horsepower at a cost of four millions; the Sierra and San Francisco Power Company for the development of 31,704 theoretical horsepower at a cost of $740,000.

But the tremendous potential work of the commission lies in the program for the determination of water rights perticularly on streams where large stream bed reservoirs are proposed in which to store storm water on a scale that has not been dreamed of in the past. This is a part of the great work that confronts the commission at the present time, and its achievement rests upon whether the state legislature will provide the necessary funds for surveys and investigations, together with power to supervise to a greater degree than before the streams by patrolling and measuring and dividing fairly the stream flow.

Before the water commission act was passed the only method of attempting to define water rights and to adjust disputes was through the courts. But the primary function of courts is not to make determination of water rights, but to adjust differences between litigants. Courts do not act on their own initiative or upon the desire of the water user, but only act upon the filing of a complaint by an injured party. It is almost never the case that all owners of water rights on a stream are made parties to the suit when it comes into court. Only those parties bringing action are included, and the court action decides nothing except the question brought by the complaining litigants.

There is no way by which a court decree can be effectively and quickly enforced. Contempt proceedings for a violation of the decrees of the courts are ineffective and costly and subject to the usual delay and hindrances of court routine. All of which works to shut out the small owner, who can seldom stand the cost of such suits without going into bankruptcy.

In contradistinction to this procedure the water commission can act upon the petition of one or more water users, or upon its own intitiative, and all claimants to water or use of water are required to appear. The findings in these cases are definite as to priority, and the water right certificate when issued affords the owner and the loaning agency a tangible and reliable evidence upon which to base right or title.

The work of adjudication is done by the commission after a thorough investigation by expert, unbiased engineers in the employ of all the people and not merely by engineers representing one group of people.

A tremendous saving through the prevention of litigation in the courts is effected through commission methods. An example is seen in the reference of the Bear Creek Mining Company vs. the Happy Valley irrigation district in Shasta County and the recent Stanislaus river adjudication, where there existed a most formidable legal tangle, but which was settled in two contests before the commission, straightening out the situation for 81 claimants. The costs of these adjudications to the water users are nominal and on a parity with the obtaining of an abstract of title to land, as against the extremely costly, cumbersome and oftentimes ineffective litigation of the old methods before the courts.

The commission has now come to the point where it is confronted with the problem of issuing permits for large reservoirs in many parts of the state and upon many streams, designed to store storm water. But it is easily predicted that with the storage of great amounts of water at an upper point on a stream, endless friction will arise when this water is started down stream to be used as irrigation water at a point that causes it to traverse territory where there are numerous water users intervening. In order to protect the builders of stream bed reservoirs from losing the water, and in order to distribute the water to the water users in accordance with their rights, the commission believes it would be advantageous to water users to put into effect by enabling legislation the power which it already has to appoint what are known as water masters, or zanjeros, under the direction of the commission, whose duty it shall be to measure the water and to divide it at all times.

This system of water administration is in use in most of the western states where irrigation is practiced. It calls for an intelligent officer, not necessarily an engineer, but one who can accurately measure water, and who will be an unbiased employe of the people, rather than the employe of any corporation or group of individuals. The ditch interests on the Kings river were the first to appreciate this system, and in July of 1919 appealed to the commission for the appointment of a water master. Settlement of water litigation had not been effected through a period of 50 years of wrangling in the courts, but a commission engineer has succeeded in successfully apportioning the water to the expressed satisfaction of all the numerous parties concerned.

The Sacramento river last season was another instance of state supervision of diversions. The threatened shortage of water was prevented by the commission water master and a corps of assistants, who apportioned the flow and stopped wastage to the extent that all crops were pulled through the shortest water season in 23 years.

In order to carry out the water master idea throughout the state, and to make possible the operation of numerous great storage reservoirs that are now projected with a certainty, the commission must have enabling legislation and more funds to handle the situation, and the broadening powers are contained in bills now before the state legislature. These bills should pass, and the money to operate the commission on a larger scale should be appropriated, and it should be done from the standpoint of economy and the increase of wealth within the state.

Tractors in the Rice Fields

By Arthur L. Dahl

IN the rice growing sections of the South the farmers used to dub their work horses or mules "mud hens" because they had to do so much of their work in the mud. In rice culture there is more water than soil used to produce a crop, and the grower must carry on his operations on ground that has been saturated with long standing water and where mud is so deep as to render difficult the use of horses and ordinary farm implements.

The modern tractor has been a boon to rice growers, and in no branch of agriculture has their value been more thoroughly demonstrated than in the rice fields of California. They do the plowing and preparation of the fields for the crops, and when harvest time comes they are the first in the field. In California, when the rice is ripe and ready for cutting, a delay of several weeks, or even several days, to permit the ground to dry out for animal use, often results in severe losses through unfavorable weather. Tractor farmers, on the other hand, frequently go upon the land almost immediately after the water is drawn off, for the tracklaying type in common use here, by distributing the weight of the machine evenly over the ground, and the superior traction thereby secured, enables the outfit to go anywhere and at the same time pull the rice cutting or harvesting machines. Sometimes the owner will equip his binders or harvesters with specially designed skids, or sleds, to prevent them from being mired, but the tractor will pull the load if properly handled.

This ability to go anyhere at any time makes the rice grower independent of ground conditions and is a positive insurance against loss through delay or unfavorable weather conditions.

In the spring or early fall when plowing is to be done the tractor will do the job better than horses, for it can plow deeper, work faster and longer, do more uniform work with less labor for the operator. The system of levees which traverse all rice fields, and which are necessary to insure a uniform stand of water upon the growing rice, is one of the serious drawbacks to the use of animals in plowing and cultivating the fields. The water stands for long periods in the borders of these levees, and the resultant mud makes plowing impossible close up when horses are used. The tractor, however, with its superior power and traction, can easily navigate this no man's land, thus preparing all portions of the field. In the building or repair of the levees themselves or in digging canals or laterals the tractor furnishes adequate power for the work and is more easily handled than horses.

Rice requires a long growing season, and sometimes the grain does not ripen in California until close to the beginning of the wet season, and growers are anxious until their crops can be harvested and stored where early rains can do no damage. Possessing the power of many horses the tractor can perform more work in a given time, and being tireless the task of cutting, raking, binding and stacking can be carried on continuously so that the preparation for threshing can be pushed with all possible speed.

When the rice has been cut and

(Continued on Page 417.)

Agricultural News Notes of the Pacific Coast

Northern California

Farmers of Glen Olive, Yolo County, are donating work on local roads.

Cloverdale, Sonoma County, expects to have a new cooperative cheese factory.

Effort is being made to hold cooperative fat hog auctions in Tehama County.

The Banta-Carbona irrigation district has been formed in Alameda County.

The first carload shipment of asparagus left Sacramento for New York on March 11.

A peach growers department is being organized in the Sutter County farm bureau.

There is talk of constructing a cooperative grain elevator at Lincoln, Placer County.

The free market project for Marysville, Yolo County, is arousing interest among growers.

A poultry breeding contest has been started in Sonoma County to extend over three, and possibly four, years.

A mutual fire insurance company has been organized in Glenn County as a result of effort in the farm bureau.

Hog growers of Mendocino, Sonoma, Napa, Solano and Marin Counties are cooperating in holding hog auction sales.

Nevada County farm bureaus will have a series of demonstrations in pruning and soil erosion control this spring.

Plans are in the making for cooperative work in the building of a road over Hatchet Creek mountain in Shasta County.

A community meat ring has been formed at Mount George, Napa County, members taking turns in killing and distributing.

Twenty members of the Orangevale farm center, Sacramento County, recently made auto tour of the pear growing section along the river.

Central California Wool Growers Association has fixed $70 as maximum monthly wage for herders, probably after the lambing season to be lowered to $60.

The Hayward Pea Growers Association has signed up the growers of the Pismo district and will ship the southern crop first. The peas are auctioned at Hayward.

The farm center at Paradise, Butte County has organized a strawberry growing club which will take up work under direction of the committee of the berry growers department.

The Lake farm center of Glenn County reports a very successful business being done by its cooperative meat market. The market operates on a 15 per cent commission basis.

A shipment of 500 bales of Australian wool was received in San Francisco last week. This is said to be the first of a 300,000 bale consignment to be put into this country before a protective tariff can be passed.

The Central California Wool Growers Association held a joint meeting at Stockton with the San Joaquin Valley Wool Growers and Marysville Associations to decide on prices for spring shearing. Ten cents per head for hand shearing and 13 for machine shearing was decided on, board furnished.

Central California

Effort is being made to build a grain elevator at Stratford, Kings County.

The Fresno County farm bureau has appointed a permanent road committee.

Watsonville has shipped 2652 carloads of apples, with 150 yet in storage.

The farm center at Dixieland, Madera County, has purchased community scales.

The Stanislaus County farm bureau now employs four men in marketing veal calves.

The Salinas high school, Monterey County, is carrying on an egg incubation contest.

The Stanislaus County Poultry Association is planing to cooperate in buying feeds and supplies.

The Corralitos farm bureau of Santa Cruz County is planning to construct a new community hall.

Grain growers of Monterey County are discussing the building of a cooperative grain elevator.

Grain growers of Fresno County are planning to establish a cooperative grain elevator at Burrell.

Modesto, Stanislaus County, expects to have a sorghum syrup factory ready for operating next season.

The Turlock local of the Farmers Union has unanimously endorsed the Associated Raisin Company.

The Grangeville center of the Kings County farm bureau is serving a hot lunch at noon to 165 school children.

Petition has been presented to Kern County supervisors for formation of the Indian Wells Valley irrigation district.

The Stanislaus County Holstein Breeders Association is carrying on calf club work among the boys and girls of the county.

The handling of cantaloupes and watermelons will be added to the activities of the Tri-County Marketing Exchange of Madera, Merced and Stanislaus.

Earl D. Schlaman has been appointed assistant farm adviser for San Joaquin County to succeed Frank Spurrier, who goes to take charge of club work in Northern California.

More than 100 growers and shippers of Lodi, San Joaquin County, have formed the Lodi Growers and Shippers League, electing Geo. W. Ashley, president, and G. L. Bennett, secretary.

Fresno County occupies fourth place for the number of motor vehicles registered in 1921. Los Angeles leads with 161,736, San Francisco has 47,969 Alameda 36,132 and Fresno 30, 899.

An experimental vineyard under the control of the United States department of agriculture, will be maintained at Fresno. Grafting and other viticultural experiments will be carried on with the idea of developing new varieties and finding use for wine grape vineyards that ranchers may desire to convert into raisin or table grapes.

With a two day celebration assured (April 29 and 30) plans for the California Raisin Festival for 1921 are being rapidly completed. The first day will feature a parade pageant of allegorical character, and a mammoth chorus of one thousand voices, and a special oratorio arrangement. The Raisin Day Classic, speedway automobile race, will be held on April 30.

Southern California

The Santa Barbara farm bureau is planning a county fair this fall.

Placentia, Orange County, will hold a May Day fete, Monday, May 2.

Yucaipa, San Bernardino County, is organizing a center of the farm bureau.

Carpinteria, Santa Barbara County, is planning extensive road improvement.

A boys' pig feeding contest has been started at Chino, San Bernardino County.

The farm bureau center at Mound, Ventura County, has purchased a community fruit sprayer.

Trial is being made in Imperial County of the acetylene flash gun in controlling wild ducks.

The farm bureau of Lankershim, Los Angeles County, has elected A. P. Stoutwell president.

The Covina farm center of Los Angeles has adopted a wage scale for tractor and team work.

Coachella Valley onion growers expect to send out their first carload shipments about April 10.

Permanent tree pruning demonstrations are being established at Fallbrook, San Diego County.

Victor Valley, San Bernardino County, has a chamber of commerce which has declared war on mistletoe.

Plans are being made for the drainage of the lowlands west and southwest of Oxnard, Ventura County.

The onion acreage in the Coachella Valley is estimated at 1,700. This is only about half of last year's planting.

San Dimas lemon growers have figured out that they can save $80,000 by shipping lemons by Panama Canal.

Dairymen of Tierra Bonita, Los Angeles County, are requesting the farm bureau to extend the cow testing work to their section.

Lemon growers of California generally estimate that the sales of the past 12 months make a net loss of $1 per box to every grower.

Imperial County farmers have secured the assistance of an expert from the U. S. biological survey to work out a method of controlling blackbirds.

Los Angeles County farm bureau is to hold meeting of poultry producers at Pomona, Tuesday, April 5, to be in the form of a picnic at Ganesha Park.

The dairymen's department of the Los Angeles County farm bureau is to hold a meeting on the Pellissier ranch near Whittier early in April, exact date not yet named.

Imperial Valley cotton growers are endeavoring to find a market which will pay 30 cents for its remaining cotton. It is now proposed to make direct shipment to Europe.

A survey of the Imperial County Cow Testing Association shows 22 out of 23 members have purebred sires at the head of their herds and the other one now negotiating for a purebred.

Inspector Hosford reports the sale of some 3,000,000 strawberry plants by one firm this year in the district southwest of Los Angeles. He estimates 750 of additional acreage next year. This will make a total of some 1,250 bearing acres in the spring of 1922.

The Coast and General

Sheep are being taken off the winter range in Utah.

Portland, Oregon, will hold her Rose Carnival June 8-10.

Nevada stockmen report cattle and sheep in excellent condition.

During last year 130 new silos were built in Wallowa County, Oregon.

Colorado reports light snow cover in most counties with livestock in good condition.

The Annual Northwest Livestock Conference was held at Spokane, Washington, March 22-24.

The lower ranges are becoming accessible in Idaho and the movement of cattle has started. Stock is in good shape.

Reports from Santa Fe, New Mexico, are that the weather has been warm and dry with fruit trees too far advanced.

Rains in the southern part of Arizona early in March were particularly welcome to range men, as the pastures were becoming dry and prospects for spring feed were anything but bright.

The Oregon state land settlement commission has authorized the purchase of 60 acres near Prineville to be used as a model state farm. Four other such farms will be established in that state.

The proposed four-state farm meeting which was to have been held March 21 at Spokane has been postponed until some time in June because of inability of President Howard of the American Farm Bureau Federation to attend at the early date.

Quarantine regulations of the Arizona horticultural commission now prevent the introduction of sweet potato plants from Texas on account of the sweet potato weevil, and of peach trees from Nevada, Florida, Alabama or the northeastern states on account of peach yellows.

The plans of the Committee of Seventeen for a farmer owned national grain marketing system will be placed before grain growers of the United States at a conference in Chicago, April 6. One delegate will be allowed from each state producing $10,000,000 worth of surplus grain and an additional delegate for each $15,000,000 worth.

Cattlemen and sheepmen in Gila County, Arizona, are trying to settle amicably the matter of a trail over which the sheep may be driven in the fall from the higher elevations to the lower deserts and valleys for winter feeding and for the return trip in the spring. One trail is now in use but sheepmen ask for another, and cattlemen are objecting on the ground that it would destroy too great a proportion of the feed on the ranges of some of the smaller cattlemen.

Land owners under the Auxiliary Eastern Canal in the Salt River Valley of Arizona voted recently to raise $2,000,000 by the sale of bonds for the purpose of building canals, ditches and substations to bring their lands under water. The area involved is approximately 38,000 acres. A part of the necessary water will be supplied from wells and a part from the flood waters of the Salt River or Roosevelt project. This land lies to the east of the lands watered from the Roosevelt dam.

Did You Buy "Separators" or Insulation?

When you bought your battery it had either separators or *insulation* between the positive and negative plates.

If you were battery-wise enough to buy a car with a Willard Threaded Rubber Battery on it, that's all you *need to know*.

If you bought one with ordinary wood separators you will find out that there is an important difference between "separators" and "insulation," and the news may come in the form of a sudden breakdown that leaves you with a bill to pay for having those separators replaced.

Most of the cars with wide reputation for quality use the Willard Threaded Rubber Battery—the battery with *insulation* that outlasts the plates. The complete list—174 makes of cars and trucks on which Willard Threaded Rubber Batteries are standard equipment—is published in Willard national advertising, or can be had from any of the dealers below.

Go to the nearest dealer in your territory when you need a new battery, or authorized Willard Service.

A Safe Lantern on the Farm

No Oil—No Matches—No Wick—No Dirt

"Lanterns are so often carried into barns where hay is stored or other dangerous places that they always should be carefully used. In the course of time, the safer and more convenient electric hand-light probably will take their places." — National Board of Fire Underwriters.

A "Safer and More Convenient Electric Hand-Light" is the

QUICK-LITE ELECTRIC LANTERN

Two Bulbs—Two Batteries—Two Colors

Let Us Send You This Wonderful Lantern For a Ten Days' Free Trial

The Quick-Lite Electric Lantern is made of auto-body steel, nickel-plated, and is shipped in specially prepared cartons. Patent Quick-Lite Duplex Battery, connecting with two bulbs, quadruples reliability. Instantaneous change to red light is invaluable in an emergency. Juick-Lite Duplex Battery gives 75 hours of intermittent burning.

YOU TAKE NO RISK

We hereby guarantee that should the purchaser of a Quick-Lite Electric Lantern, after having tried it for a period of ten days, decide for any reason to return the lantern, we will immediately refund the $7.50 purchase price, making no charge for the use of the Quick-Lite Electric Lantern. All that we ask is that notice be given at the end of ten days.

"ELIMINATES DANGER"

Remit $7.50 for Quick-Lite Electric Lantern complete with Quick-Lite Duplex Battery, and we will forward it, express paid.

BORDEAUX-OIL EMULSION SPRAY FOR CITRUS

Since the beginning of spraying for citrus disease control in Florida growers have been handicapped in the use of Bordeaux mixture because of the marked increase of scale insects following treatment of citrus trees with this fungicide. This increase is attributed to the killing by the fungicide of certain beneficial fungi that parasitize the scale insects and hold them in check. In other words, the Bordeaux mixture incidentally cures the scale insects of their fungous diseases; hence Bordeaux spraying always had to be followed closely by special oil or soap sprays to control scale insects. This added greatly to expenses and deterred many from using Bordeaux mixture.

The advent of lime-sulphur sprays obviated this difficulty in part. They are somewhat weaker than Bordeaux mixture in general fungicidal value but have, in addition, distinct insecticidal value against the scales in their young stages, and effectively control rust mites. But this somewhat lower fungicidal value gives less effective control of fungous diseases, such as citrus scab and melanose, especially under conditions very favorable for the development of these diseases. The problem still remains of getting a spray that would have the fungicidal effectiveness of Bordeaux mixture without the bad after effect of scale increase.

The very simple solution of this problem, worked out jointly by plant pathologists and entomologists of the United States department of agriculture, is to combine the Bordeaux mixture fungicide with the oil emulsion scalecide. A method of making this mixture has been devised and has been tested out in grove practice by a number of representative growers for the first time during the last season and proved generally effective. The secret of doing this successfully is to have a good agitating outfit in the spray tank and to keep it churning while the oil emulsion is being poured into Bordeaux mixture made in the usual way, as well as later while spraying. Such a combination of 3-3-50 Bordeaux mixture and oil emulsion carrying one-half per cent of oil is safe to use on citrus fruits; it retains apparently the full fungicidal value of the Bordeaux mixture; it has sufficient scalecidal effect to eliminate the usual post Bordeaux increase of scale, and it spreads nicely over the plant surfaces. This does not replace the fall or winter special spray with one per cent oil emulsion usually required in scale infested citrus groves.

SELECTION OF GUAVAS

As we have before stated, budded varieties of all guavas are needed. As an example, the Paraguay guava, Feijoa Sellowiana, may be cited. Had not the best seedlings been named and perpetuated through budding, this guava would before now have passed out of the market, for seedlings, even from the best types, are extremely unreliable. We need budded varieties of the common strawberry guava for one or more in every dozen plants purchased are not worth growing. All plants so vary to some extent, even in their native habitat, as witness the following description sent, with seeds, to the United States department of agriculture and so published:

"Seeds from Tlacotalpan, Vera Cruz, Mexico (1910). An evergreen arborescent shrub, 12 to 20 feet high, indigenous to the tropical mainland of America, from where it has been introduced to practically all parts of the tropics. The fruit is round, oblong or pyriform, the best varieties attaining a weight of eight to ten ounces. The skin is smooth and yellowish; the flesh, in which the numerous seeds are embedded, is whitish, yellowish or reddish and usually very aromatic. The quality and flavor vary exceedingly, certain types being flat and insipid, others very sweet, and still others more or less acid. The sweet and subacid sorts may be eaten with cream as a dessert fruit. From the acid fruits a superior jelly is manufactured. By-products obtained in its manufacture are guava marmalade and guava cheese."

DEHYDRATORS LEAGUE OF CALIFORNIA ORGANIZED

At a recent meeting in San Francisco of producers of dehydrated fruits and vegetables and manufacturers of dehydration machinery, and as a result of previous deliberations by a committee headed by E. M. Sheehan, president and manager of the California Grape Growers' Exchange, the dehydrators League of California was established.

Three previous meetings, largely in the nature of conferences on dehydration, had been held prior to the meeting of March 8. The new organization is the result of the conference on dehydration held at the 53d State Fruit Growers and Farmers Convention in Fresno, November 9-12, 1920.

The Dehydrators League has for its aims and objects the standardization of dehydrated fruit and vegetable products and dehydration machinery. Matters of general interest to the trade will also be taken up. The plan of organization is based on that of the National Canners League and is a long step forward in the development of this important industry.

PANAMA PAPAYAS

More than 10 years ago W. G. Ross, Empire, Canal Zone, Panama, sent to the United States department of agriculture seeds of a splendid Carica papaya fruit, registered at Washington under the number 28533. Mr. Ross wrote that the fruit weighed more than 16 pounds, was cylindrical in shape, very rich in flavor, with very small seed cavity and less seeds than most others. It has been demonstrated that the papaya will produce fruit in California in practically frostless localities and large plants are growing in many favored spots. Why experiment with small fruited varieties when Uncle Sam has introduced such a mammoth fruiting strain.

HIGH NUTRITIVE VALUE IN AVOCADO

That the avocado has a high nutritive value and that its content of fat in some instances exceeds that of butter were the statements today of Professor M. E. Jaffa of the University of California. He says: "The avocado combines a natural combination of fruit and oil. The fact that the native Cubans prefer this fruit to any other of their abundant supply may be due to its flavor alone, but it is more than likely that the preference is more deep seated, and that it is the result of generations of experience or of a knowledge of its beneficial effects."

The avocado was introduced into California, at Santa Barbara, in 1870.

STRAWBERRY PLANTS SHOULD BE SPRAYED

The office of pest control, California department of agriculture, is conducting experiments to assist strawberry growers in controlling the strawberry leaf beetle (Typophorus canella), which is proving very destructive to berry plants throughout the state. Until definite results are available it is suggested that growers give the strawberry fields an application of arsenate of lead, 2 pounds to 50 gallons, or dust the fields thoroughly with arsenate of lead dust. If the dust treatment is used it should be applied to the plants early in the day when they are still wet with dew. Both sulphuring and dusting should be done immediately before the berries become too greatly advanced.

RULING PERTAINING TO INTERSTATE GRAPEVINE STOCK

In reply to numerous inquiries, the department of agriculture recommends that the following procedure be adopted in the handling of grapevines from all points outside of California.

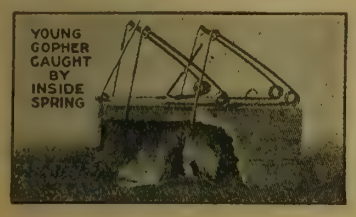
"If vines show evidence of phylloxera infestation refuse admittance."

"If no evidence of infestation is found, subject vines to hot water treatment as recommended by the viticultural service, department of agriculture, and pass vines."

Successful Gopher Trapping

In studying the habits of pocket gophers, and investigating thoroughly gopher-trap-construction, it was found that a trap to be a real success must be large enough and so constructed that when placed directly in front of, not in, the runway the gopher would actually be in the trap before discovering it.

The illustration below will give the reader an idea of the construction of this new invention called the **Double Catch Gopher Trap.** It will be noticed that the young gopher has been caught by the inside spring, proving that in working towards the light shining through the light-hole in rear of box the rodent was pushing a small amount of dirt tripping the trap after passing the first or end spring.



Now look at the illustration below. Here is a gopher nearly a foot in length and so large that a trap placed in the run would have failed. This rodent was pushing a lot of dirt towards the light-hole in an effort to shut out the light, and throwing the dirt against the trip-plate in rear of box sprung the trap. Had there been one spring only in this trap, as in the ordinary box trap, this gopher would still be destroying the farmer's crop.

The illustration below shows two pocket gophers, a very small one and a very large one, both being caught in a **Double Catch Trap.** This is the only trap which when placed in position before the gopher's run is set for either the smallest or largest rodent. Many letters we receive from customers mention this excellent and valuable feature. It may also interest the reader to know that farmers writing to us about this truly wonderful trap say that they never fail to catch the gophers.

We have now come to the most interesting part of this article. The illustration below shows a "catch" of pocket gophers by Lisle Percival, a **seven-year-old boy,** of Lathrop, California. This boy catches gophers with the **Double Catch Trap** without failures. We can furnish no more convincing evidence of the value of this trap than this picture.

All illustrations used in this article are from actual photographs.

We manufacture the **Chubbuck Double Catch Gopher Traps** and same are being distributed by Seed stores and Hardware dealers. If you cannot secure these traps from your dealers send direct to us. **Price, post-paid, 75c.** Instructions with each trap. Illustrated circulars free.

TRACTORS IN THE RICE FIELDS

(Continued from Page 413.)

stacked ready for threshing, the tractor is an ideal form of power to use in operating the thresher. By belting the motor of the tractor to the threshing machine a uniform and adequate supply of power is secured, and there is no danger from straw fires such as are often associated with the old fashioned threshing machine.

When the rice has been sacked and placed on trailers or wagons the tractor is used to haul them to the store house, particularly if the threshing field is some distance from the warehouse. Since the tractor will pull six or seven loaded wagons at one time, the rice can be hauled and stored with the minimum amount of supervision and delay.

The tractor will also furnish the power to operate a baling machine for the rice straw, rendering it fit for immediate shipment to market. The market for rice straw is constantly increasing, for new uses have been found for this material, including the making of an insulating material for cold storage purposes, the use of rice straw for filling mattresses, or bedding stock and other purposes. By baling the rice straw as it comes from the thresher it can be kept clean and retain its fresh color so that better prices can be secured for the material.

Although the culture of rice in California is a comparatively new industry it has met with remarkable success in the northern part of the state, and the acreage has expanded until now more than 100,000 acres are devoted to the growing of this cereal. The quality is excellent, and owing to the long, hot, dry summers, the growing season is ideal. On the other hand, because of the fact that the growers have but two seasons to contend with, the wet and the dry, it is essential to have the work on the plantation done according to strict schedule. Sometimes the fall rains set in earlier than expected, and when the crop is ripe and ready to harvest, if subjected to the cold, torrential rains that sometimes usher in the rainy season, great damage is done.

Almost without exception the California rice growers rely upon tractors to do the work in their fields because they know from experience that the tractor is dependable and will carry on the various field operations on schedule time. Several of the most successful of the tracklaying type of tractors are made in the Secramento Valley, in the midst of the rice growing sections, and the manufacturers have studied the problems of the rice growers and have adapted their machines to meet the peculiar conditions of the industry.

The rice growers use the tractor for plowing the fields in the fall just after the harvest. The soil is then left to the action of the winter rains, and early in the spring the tractors are used for getting the soil in shape for planting. The plowing, harrowing and seeding is all done by tractor power, and when the water is turned in to the fields, and the long growing season begins, the tractors are used for building up the levees, doing belt work around the ranch, pumping water, or some other useful work. On the other hand, if there is none of this kind of work to do, the farmer can run his tractor into the barn and leave it there until needed. He has no idle horses to feed and care for, and there is no expense of maintaining during the slack season the power needed to carry on the work when the peak period of labor is on.

The use of tractors for hauling purposes has reached its greatest development in California, and in the rich agricultural regions of the interior valleys it is a common sight to see a long string of heavily loaded wagons coming along the highway pulled by a tractor, and much of the grain from the big ranches is hauled to the mills and warehouses in this manner. The broad tread of the tractor, free from cleats, is not injurious to the roads, and they are permitted to operate on the public roads when equipped in compliance with highway regulations.

To fill the needs of California

The particular needs of California were carefully considered before the first Allis-Chalmers 18-30 was ever built. America's foremost consulting engineers worked for seven years to perfect this tractor.

That is why to-day it sets heretofore unattained standards in farm power efficiency and will not only do its work but do it more economically at less expense and for a longer period of time.

With this tractor you can do the work of 8 horses at less than one-third the cost. It is backed up by a $42,500,000 institution 65 years old.

See this remarkable tractor demonstrated on your own land. Drive it and feel the reserve power under the throttle. Convince yourself that this is the machine you need. A reliable dealer in your community will give you this demonstration

Preferred Avocados

The committee on registration and classification of the California Avocado Association is active every month and usually many times during the month, visiting trees of promising new varieties, sampling their fruits when in season, and obtaining further information about the older kinds which have been recommended by the association for commercial planting. In October, 1917, a circular was issued recommending eight named varieties. After careful observation of these for three years longer, in August, 1920, another circular was sent out, reducing the number of preferred varieties to five, giving the reasons therefor and brief descriptions of those retained. From this last report we present their conclusions as to the relative merits of the eight originally recommended.

Unsatisfactory Varieties

"This association occupies the position of guide and advisor to the men who come into our young industry and plant avocado orchards. With few or no exceptions they will want rapid returns on their investments, with as little hindrance and unexpected expense as possible while awaiting crops. We must consider their interests and, as a matter of justice to them, we find the Taft, the Lyon and the Blakeman varieties should be dropped from the list of varieties recommended for commercial planting, which we do with regret.

"The Taft fruit is very fine, one of the very best, and the tree itself beautiful, and one that when it finally does come into bearing will compensate those willing to wait a long time for returns; but it is longer in coming into bearing than the others that have been recommended and more susceptible to frost injury. It is no longer commercially planted.

"The Lyon is also a good fruit and the tree remarkably precocious and prolific and best adapted for interplanting, by reason of its slender shape, but it has proved too generally weak and hard to raise; many trees in many plantings have died and a decay has developed in some of the fruit while still on the tree. We find this has occurred even in the parent tree. Fortunately, these defects do not interfere with the continuance of good prices for the sound fruit from the good crops being given by the good trees, nor do they interfere with planting of the trees by those willing to take the risks involved.

"The Blakeman is one of the hardier varieties, with fruit of desirable size and quality, weight about one pound, color glossy green, and seed comparatively small. Some three year old trees are bearing well and the parent tree is a good and regular bearer. The growth of the tree is too spreading and needs pruning when young to produce a compact and proper shape in the older tree. What we lack with this variety is experience with the young budded trees. It has been very limited and we feel that until we have more the variety should not be continued on the list."

Varieties Recommended

"The Fuerte is one of the hardier varieties on the list, one of the most vigorous growing trees, an early and productive bearer, with fruit of the higest quality ripening at a very desirable period, but with a greater variation on the same tree in size and shape of fruit than usual, and with some coming too small.

"The Spinks is also a strong growing tree. The large fruit is noted for its handsome appearance and has a long ripening period lasting from early in the year until October. Some fruit tested in October by Mr. Wilson Popenoe was pronounced, in a letter which he wrote, equal in flavor to best he had found in Guatemala. The committee was also greatly pleased with fruit tested that month, finding it of the highest charcater, but found some tested early in the season, though well colored and of good flavor, far from equal to the late fruit. The seed of this variety averages large in proportion to the flesh.

"The budded trees of the Dickinson are proving better than the parent, both in tree and fruit. An outstanding feature of this fruit is its notably rough, warty skin, which becomes a glossy, handsome purple and identifies the variety. The quality is good and it comes in a period of its own—in the summer.

"The Sharpless is well known for its handsome, large fruit, comparatively small seed, high quality and very desirable ripening period of fall and early winter. It requires about a year and a half from the blossom to maturity of the fruit.

"The Puebla tree is one of the best types of the avocado, sturdy, hardy, compact, precocious and productive. The glossy, handsome, pear shaped, purple fruit matures at a good season, but is smaller and with thinner skin than the others on the recommended list. The period required from the blossom to the maturity of the fruit is the shortest of any kind on the list, requiring about eight months, and the seed is of medium size."

Fruit Marketing Convention

SAMUEL ADAMS, of the American Fruit Grower, has recently been touring orchard sections of the Pacific Coast, calling attention to a big meeting of fruit growers which is to be held in Chicago, April 5. Mr. Adams is not only editor of a national fruit journal published in Chicago, but he is a commercial grower of apples, having large properties in West Virginia. Hence he has inside information on some of the marketing difficulties confronting fruit growers in general. On this point he writes:

"The marketing of fruit is the largest problem confronting fruit growers everywhere, no matter what kind of fruit or where produced. But the time now is ripe for such a meeting as is made possible by the combined action of the American Farm Bureau Federation and the American Pomological Society. The meeting should have a large attendance of representative fruit growers and cooperative marketing associations from every important locality. The far western, southern and eastern states particularly should be represented by a large number of delegates at this conference. Those desiring appointment as delegates should take the matter up immediately with their county agents and the presidents of their state farm bureau."

Regarding the big meeting of fruit growers:

"A national conference of fruit growers is to be held in Chicago, starting April 5, for the purpose of devising plans that will simplify and improve the marketing of all fruits produced in the United States, and the call has just been issued by the American Farm Bureau Federation. It is the outgrowth of a movement started by the American Pomological Society at its meeting in Columbus last December and brought to a definite conclusion at a conference between J. R. Howard, president American Farm Bureau Federation, C. H. Gustafson, director of the cooperative marketing division of the federation, and Samuel Adams, editor of American Fruit Grower and acting president of the American Pomological Society.

"At the Columbus meeting the society appointed a ways and means committee whose duty was that of arranging for the appointment of officers and obtaining finances for the proposed marketing division of the society. This committee held a meeting in Chicago, January 28 and 29, those in attendance being H. H. Hardie, G. H. Minnich, Paul C. Stark, Frederic Cranefield, R. B Cruickshank and Samuel Adams. Through the absence of Prof. L. H. Bailey on a prolonged trip to South America, the committee appointed Mr. Adams acting president, and entered into a discussion of the possible duties and service that might be rendered by the marketing division of the society. Plans were made for

the solicitation of funds that would enable the marketing division to function. Upon the outcome of the meeting will in a large measure rest the solution of some of the gravest difficulties fruit growers now face and the creation of means for bettering conditions that can be improved most quickly only by united action."

Mr. Adams' name was presented to the Republican convention held in Chicago as nominee for vice-president of the United States.

FEDERAL QUARANTINE NO. 37

Dr. C. L. Marlatt, chairman of the federal horticultural board, has issued a ten page circular explaining the workings of Federal Quarantine No. 37. This is so comprehensive and enlightening that anyone reading it must be convinced that the board will aid in the importation of any plants, stocks, grafts, buds or seeds that would prove a benefit to the horticulture of this country. The ground covered by this "statement of facts" is very clearly indicated in the opening paragraph.

"Any law or regulation which restricts freedom of action on the part of the individual necessarily has enemies. Federal and state plant quarantine legislation aiming to protect this country from new important plant pests is not an exception to this rule. Just now Federal Quarantine No. 37, which restricts the entry of foreign plants to prevent such entry of pests is being unjustly criticised by a few persons who would like to see this quarantine abolished or amended so that in large measure the old time free importation of foreign nursery stock and other plants could be resumed with all its attendant dangers. It would hardly be worth while to pay attention to these criticisms except that they absolutely misrepresent the quarantine and have been widely circularized through a fairly active propaganda and unfortunately have been accepted at face value by many plant amateurs and societies of such amateurs. Such persons and societies, from lack of acquaintance with the quarantine and its workings, have thus obtained a very erroneous idea of the actual restrictions now being enforced on the entry of foreign plants. The agricultural and horticultural and nursery interests of this country appreciate the need for this quarantine and understand the provisions limiting plant importations. But for the information of plant amateurs throughout the country and of amateur horticultural and garden societies, etc., it seems desirable to issue a statement of facts in relation to Quarantine 37, indicating the provisions which are made under it for the importation either free or under restriction of any plant whatsoever for which a necessity can be shown and to correct the more important of the misrepresentations which have gained acceptance in some quarters through lack of accurate information about the quarantine."

STATE ISSUES PUBLICATIONS

Some exceptionally good stuff is appearing in the publications sent out by the state department of agriculture. Among them:

The December Monthly Bulletin reporting proceedings of the fifty-third convention of fruit growers and farmers at Fresno, 1920, is now being distributed.

The following publications are on the press and will be issued within the next 30 days: January Monthly Bulletin devoted to "Agricultural Chemistry and Fertilizers." February Monthly Bulletin reporting the "Second Dehydration Convention," held at Fresno, 1920. March Monthly Bulletin reporting the proceeedings of the Potato Growers Convention, Fresno, 1920.

The new Brand Book Supplement, issued by the cattle protection service will be ready for distribution within a few days and contains all cattle brands recorded up to June 30, 1920.

"California Dairy Production," issued as Circular 3, division animal industry, will be ready for distribution this week. In addition to dairy production figures this publication contains a directory of all milk establishments, cheese factories, ice-cream plants, butter factories and by-product houses.

A report of the biological control of the black scale of citrus will be included in the coming April number of the Monthly Bulletin.

DURANGO COTTON SEED

From one of our best test fields, resulting from three years' selection, starting with carefully bred California acclimatized seed. We rogue for less spreading type of plant, permitting close planting; for productiveness and for larger bolls which open wider, fluff more and pick easily; also and especially for early maturity and for lint length and strength. We receive premium for uniformity lint length, strength and color. Seed cotton from which these seed selected ginned over 32% More net income per acre growing this type Durango than any other kind or type of cotton known to us. Our seed purchased in carload lots by Cotton Associations. We ship to Arizona, New Mexico and East. Inspected and approved by Government officials, State Entomologists and Quarantine officers. Ask any of them. By the bag, approximately sixty pounds, five cents per pound, f. o. b. Westhaven. Check must accompany order. No more carload lots. Telegraph for ton prices. Immediate mail replies cannot be given except where fee to Mr. Stanton is paid. When replies are wished in Cultivator address query to 115½ N. Broadway, Los Angeles.

Joint Homestead

Husband and wife have a joint homestead recorded. There are three children. In case of the husband's death what are the rights of the wife? What becomes of the personal property, such as machinery and stock?—Subscriber, Hanford.

Upon the death of either of the spouses the whole of the property upon which the homestead has been recorded reverts to the survivor as a homestead is in many respects similar to an estate with right of survivorship. It is necessary only to establish the fact of death by a comparatively simple court procedure. The homestead, of course, does not cover any personal property, and such personal property is subject to administration by the usual method.

Deed to Avoid Probate

If a husband desires that his wife shall inherit all of his property, is a deed properly signed and given to the wife or a third party in trust to be delivered to her at her husband's death a satisfactory procedure, the property having been acquired since marriage with funds acquired by husband both before and after marriage. —Subscriber, Hanford.

If such deed is properly executed and delivered, it is a legal transfer and will be upheld. The difficulty has always been about proving the delivery and sometimes difficulty has arisen through subsequent disagreements between husband and wife, so it could hardly be said to be a satisfactory procedure.

Wife's Property

In case of the death of the wife, does property inherited by her go to the husband? What legal proceedings should be taken?—Subscriber, Hanford.

It does not. Such property is subject to absolute disposition by the wife through her will, and in case of her death without will, according to the law of succession. If she leave a husband and no children one-half such separate estate would go to the husband and the other one-half to her father and mother in equal shares, or in case of the death of either of them, then to her next of kin. If she left a husband and one child, then in equal shares. If more than one child, one-third to the surviving husband and the remainder in equal shares to the children.

Employer's Liability

If I hire help and furnish implements or tractor am I liable if the help is injured? If I contract at so much per hour or so much per acre with the party owning tractor or implements am I liable?—Subscriber, Covina.

In the first instance, except in the case of labor employed for domestic service, agricultural, viticultural, or horticultural purposes, the employer is liable under the employer's liability act. In the second instance the party contracting is not liable as the liability is transferred to the independent contractor giving the tractor and employing the parties to operate such tractor.

Fence Misplaced

A owns 40 acres improved with fruit. B buys land lying along the whole of A's place. Both places are fenced. B puts $5,000 in improvements on his land, including a well located on the southern corner. A then sells to C. A recent survey shows that the line should run 40 feet to the west, which places all of B's improvements within C's property line. What can B do? Can C charge B improved prices for the strip of land? Can he refuse to sell?—Subscriber, Madera.

The direct question is in respect to the sale. If the land belongs to C he can, of course, refuse to sell, or, if he sells, he can sell for any price he chooses, but the answer for such a question is not quite so simple. The places when purchased were fenced. Undoubtedly, these fences were placed there for some reason. If C or A, or either of their grantors, stood by and saw B place his improvements upon this land, it is probable that they would be estopped to claim the land. It is possible that in the past history of this land there has been an agreement with respect to the placing of this fence. The parties purchasing, purchased with reference to the actual fence upon the property, and it is highly probable that a court would hold them to the fence so located irrespective of any actual or technical error in the true line. These boundary questions depend so much upon the exact facts in the history of the land that it is difficult in a medium of this character to give a definite opinion. It would undoubtedly be highly advisable for B to see a local attorney and delve into the past history of the fence. It is very probable that in an equitable action he could maintain the fence as it stood when he purchased the land as the boundary of the property.

Easement Demanded

An easement is demanded through my land. I am offered practically nothing for it, let alone damage to fields by going crosswise and thus leaving pointed rows and loss to growing crops. Can I demand a price for the loss? How shall I proceed if I am not given due compensation for my land?—Subscriber, Thermal.

It is a constitutional provision in this state that private property cannot be taken or damaged for public use without due compensation being first paid therefor. The individual is not required to accept any offer made nor is he required to accept any payment made other than through an action properly brought in court where the actual price of the land, together with any and all damage or loss occasioned to growing crops or by reason of the severance of the land is determined by the judgment, which judgment, together with the cost of such proceeding, must be paid to the land owner before the land can be taken.

Diverting Run-off

Is it unlawful for a land owner to fill up a wash through his property which in case of high water would force a flow of water across other property? Can he stop the natural passway of the stream simply to improve his own property?—Subscriber, Owensmouth.

The whole property involved at one time undoubtedly belonged to some one party owner, under which ownership the property, through which the wash is located, became burdened with the easement for the run-off of the natural waters on the other lands. After separation from the original ownership the lands remained so burdened, so that if at the time of the division of the lands there existed the right to

discharge natural waters from the upper lands to the lower lands, the lower lands were purchased with the implication of a reservation of that servitude. The lower proprietor cannot, therefore, effect a change in his property so as to bank the water upon the upper property. Certainly, he could effect no such change as to send this natural flow upon the property of another man, which was originally free from the easement existing against the property through which the wash ran.

Wife's Signature to Deed

Ranch stands in the name of the husband, although a portion of the purchase price was separate property and a portion was community property. Can the husband sell the ranch without the wife's signature? Can the wife force him to give her one-half ot the purchase price? — Subscriber, Fallbrook.

The husband has the management and control of the community and real property, but the wife must join in executing any instrument by which the community, real property, or any interest therein is sold, conveyed or encumbered, provided, however, that the instrument signed by the husband, if he holds the record title to the property, is presumed to be valid in favor of the third party acting in good faith and without knowledge of the marriage and no action to avoid such instrument may be commenced after the expiration of one year of filing of record of such instrument in the recorder's office. The wife could not require the husband to give her one-half of the purchase price for she is not entitled to manage the whole or any part of the community property whether real or personal.

Cow Recovers from Tuberculosis

Eighteen months ago a cow was taken from the pasture after snow, with very bad cold. It was found that she was tubercular. Since that time she has seemed to be in perfect health. Am I entitled to a second test? —Subscriber, Lancaster.

The provision of the dairy act requires the veterinarian in making the tubercular test to indelibly mark the ear of a reacting animal with a letter "T," one inch long. There seems to be no provision for a second test, but it would seem that if the cow was cured you should have your own veterinarians ascertain that she was cured and then you could have a second official test. The law makes no provision either way in this respect.

"THEM WERE THE HAPPY DAYS"

I am thinking today of the days of long ago when winds and sun began to melt the deep Canadian snow, and Father would come in and say, "I guess we'd better tap the maple trees back in the bush and get a run of sap." We kept a few score buckets then stored somewhere in a loft, and when the sun was getting warm, and snow was melting soft, we'd get them down and scrub them out, till all were clean and sweet, and get the spiles and boiling pan all ready and complete. Then if Old Sol kept on the job we'd find a brace and bit and hitch the team up to the sleigh and take the whole outfit back to the lot where maples grew, stored with their sweetened sap, just waiting for the spring to come when Dad would start to tap. What sport it used to be just then, when days were bright and fair, to gather in the sparkling sap and watch the fire's glare, and see the sap within the pan boil to an amber flow as hour by hour the boiling mass would sweet and sweeter grow. And if the run was good and long we'd boil far in the night and sit and watch the shadows dance around the firelight till Dad would say, "I guess she'll do. We'll draw her off right now, for Mother will be waiting home, to warm us up some chow." And when the sugaring-off day came, O how we youngsters then would beg to stay at home from school and work like little men so we could have a chance to pour hot taffy, don't you know, out in a pan to cool a while on freshly gathered snow. Oh yes, "them were the happy days," my memory's calling yet. If I could just go back again I'd surely go, you bet, and gather sap and cut the wood to keep the fire aglow and eat my fill of taffy hot, poured on a pan of snow.—G. D. Lee, Yucaipa.

Veterinary

Cow Fails to Breed

I have a Holstein cow that dropped her second calf October 29, 1920. The calf will be five months old this month and the cow shows no signs of wanting to breed again. She seems perfectly well every way and her nose is always moist. She has plenty to eat and water stands by her all the time. What do you think is the reason for this?—Subscriber, Terra Bella.

Cows that get very little exercise and are fed one kind of feed continually are liable to act as you describe. Reduce the feed and change to some other kind if you can. Turn her on grass and do not let her have all she wants of that. Once a week take her out on the road and drive or lead her eight or ten miles. This will warm her up and probably it will not be long until she comes in heat. She should have a little salt regularly. Mix one ounce of tincture of iron in a mash for her once a day for a week.

Tapeworm in Dog

Kindly inform me what is the best remedy for tapeworm in a dog. I have a sheep dog about 15 months old which is greatly troubled and from time to time I have noticed him straining and occasionally getting rid of lengths of worm, but the main portion apparently remains. He is always in poor condition and has little appetite.—Subscriber, Hopland.

Get of your druggist five powders each containing ten grains of powdered areca nut. In the morning before he gets anything else to eat give one powder mixed in half a cup of sweet milk. This may cause the whole worm to pass in a very short time. If not, give one powder every morning while they last or until you see the worm. Watch him and if he does not thrive repeat the treatment in about a month. He may have the second one. Would like to know what success you have.

Cow Pox

Rather large ulcerous sores have developed lately on the udder of my cow. She is giving about two gallons of milk a day. She has not been fresh for over a year and will not be fresh again until about July. For some time there have been hard lumps in parts of the udder which at times seem to disappear. The milk does not show any unusual conditions. What may be the trouble and what can be done for it?—Subscriber, Porterville.

The lumps in the udder are probably due to rather rich feed causing thick blood. The ulcers are probably cow pox. For the lumps give a large handful of epsom salts in the feed once a day for two or three weeks. While the cow pox is annoying and interferes some with the flow of milk it is not considered serious. When the ulcers first appear as blisters they should be opened and the liquid they contain washed away so it does not get on the other parts, as it will cause the disease to spread. The ulcers should be dressed every time the cow is milked, with a solution of permanganate of potash, one dram to the pint of water. If the ulcers get dry and have a tendency to crack they should be softened with carbolized vaseline. If you have other cows you should milk the one with the cow pox last as the disease is often carried from one cow to another on the hands. The fluid from the ulcers on a person's hands may take effect and be as good as vaccination against smallpox. It is always best to try to prevent the spread of the disease for if one of the ulcers comes on the end of a teat and gets inside it may clog the teat and cause inflammation and loss of the quarter. No internal remedies are needed more than the salts. Feed laxative feed. Turn her out to grass if possible.

Let Us Be Your Banker

We'll Help You Bring Your Land Up to Maximum Producing Capacity

By Financing Your Purchase of a Lauson Tractor

Questions and Answers

Questions to be answered in this department should be received at the office one week before reply is expected. Write plainly on one side of the paper and sign full name and address. Unsigned communications receive no attention.

Treatment for Gum Disease

Is there any remedy for gum disease without the use of lime? When is best time to apply, when trees are dormant or sap is up?—Subscriber, Ontario.

We would get busy with gum disease as soon as it appears, regardless of sap conditions. There may be formulas for preventives of this trouble not containing lime, but we believe the best all around remedy is the Bordeaux paste, made as follows: One pound bluestone dissolved in one gallon water in a wooden or earthen vessel by hanging it in the top of a sack; two pounds unslaked lime, slaked in about one-half gallon water. Stir together when cool, making a mixture about the consistency of whitewash. This may also be applied to healthy bark as a preventive against new infections. This is the treatment recommended by Prof. Fawcett some six or seven years ago and we believe it has not been superseded by anything considered better. The method of application is to thoroughly scrape or clean away all diseased bark, get down to healthy wood and apply this paste. Watch closely and as new diseased bark appears repeat the treatment.

Cutworms

What eats my sweet peas and what could I do to protect them? As soon as they come out of the ground they are eaten off. I have killed a number of snails near them. Could they be doing the damage, and what could I do to kill them?—Subscriber.

If this is the work of cutworms it will be comparatively easy to determine by making careful search under clods, stones or sticks which may be near to the plants. The cutworm is much smaller than the slug usually is, but "hand picking" will rid the place of this pest if followed persistently. Search for the pest early in the morning or in the evening. At night use small electric flashlight around the plants where they will usually be found. If an entire field is infested then about the only method of control is through poison bait. Mix according to this formula: Bran, 50 pounds; white arsenic or Paris green, 2½ pounds. Mix these together dry and then make a separate mixture of lemons (rind and all of a half dozen lemons chopped up fine), and cheap syrup or molasses, 4 quarts; water, 5 gallons. Thoroughly stir. These two mixtures may then be stirred together, or if one wants to use only a small portion, take the amount of bran and arsenic which will be used only within the next few hours and add enough of the water and lemon solution to make a wet mash. Do not, however, make it sloppy. Scatter in field under vines but be sure poultry and other domestic animals are not allowed to eat it. If damage is done by snails or slugs it can be prevented by scattering the ordinary slaked lime about the plants, even over them. The pests cannot move themselves across the lime. It must be renewed every few days, especially if damp weather or irrigation washes it into the ground.

Paying for Paper

Can I be compelled to pay for copies of a paper or magazine sent to me after my subscription has expired?

Technically, yes. The law is such that where a periodical is taken from the postoffice for a certain length of time the publisher of the paper may collect. On the other hand, the ruling of the postoffice department is that the publisher must not send the paper without payment for a period of over 12 months for a weekly, six months for a semi-weekly, three months for a monthly, so that the risk to the subscriber is comparatively nil. We will say, however, that this law is availed of by but very few publications and no reputable publication uses it simply as a lever to collect accounts unless there is real attempt to defraud.

Almonds Not Fruiting

We have two nice large healthy almond trees several years old that bloom quite full and set lots of little nuts, but they fall off when about as large as peas. Can anyone tell us the cause? Can anything be done to prevent this?

This looks very much like lack of pollination. We would suggest that subscriber read "Pollination of Almonds" in last week's paper on page 390. However, it is barely possible that weather conditions were a bit too cold during the time of setting fruit, but if other trees in the same section bear heavy crops then, presumably, as noted at first, there is need to interset other varieties which bloom at the same time.

Pollinating Satsumas

An inquirer recently asked as to best plum to plant with Satsumas, and Millard Sharpe of Vacaville suggests that either Climax or Wickson would be best for this purpose because they bloom at the same time. Of the two perhaps the Wickson is to be preferred.

Fertilizer for Potatoes

What kind of commercial fertilizer would be advisable to use when planting potatoes, how much per acre, and how should it be applied?—Subscriber, Walkers Point.

Any good complete commercial fertilizer, perhaps one rather rich in potash, say, at the rate of from 300 to 500 pounds per acre. Many of our best potato growers, however, are now putting soils in the best of condition by growing melilotus or other winter growing green manure crops. Others turn alfalfa under a short time before planting, and while some have felt that this made more scabby potatoes the crop has been sufficiently large that they have continued the practice.

Value of Coins

I have some coins dated 1864 and 1865. Can I get anything for them?—Subscriber, Puente.

Your nearest bank can probably give you the value of these coins. There is a publication known, we believe, as the "Numismatic Guide" and another known as "The Coin Book," which is a cyclopedia of rare American and foreign coins. This is published by the Royal Publishing Company of Philadelphia.

Cory Blackberries

A couple of weeks ago I saw an article in the Cultivator from a subscriber wanting information on the Cory Thornless blackberry. I have given the Cory a thorough trial and find it to be all that is claimed for it and more. It has all the advantages of the Mammoth excepting the shipping of the berries which I think when thor-

oughly ripe will not stand much handling. It is highly recommended as a berry for dehydration as there is a sort of core in the center which will not dry away as much as some of the other berries. As to production they are second to none and the fruit is really larger than the Mammoth. The flavor is delicious and somewhat like that of the Mammoth but not so sour. —Subscriber.

Avocado Importations

I am a grower of avocados in a small way and expected to do it on a larger scale, but I now note that this fruit is allowed to come in from the tropics, the Tahiti Islands, Colombia and other places. Are they also admitted from Mexico? If so, what chance have we here in California and Florida, with our high priced land, dear water and high priced fertilizers to compete in the production of this fruit? Was not there an embargo on this tropical stuff in order to keep out plant diseases, and why has this embargo been lifted?—Subscriber, San Diego.

These questions must be answered from a national as well as a Californian standpoint. Locally we get a few avocados from Hawaii and many from Florida, but the prices of imported fruits are higher than those of superior home grown avocados and we need not fear the Pacific Islands. No fruits from Colombia have reached California and it is hardly probable they would ship well to other parts. The last agricultural report of Porto Rico states that avocados cannot be shipped to the United States at present because of lack of refrigeration on freight vessels, and Porto Rico is close to us. Mexico cannot ship to California, Texas, Louisiana or Florida ports on account of federal quarantine No. 12, and certainly they could not be expected to land in New York in good condition. At the latter port hard shelled (Guatemalan type) avocados only are allowed entry and even these may be kept out through a ruling by the federal horticultural board. We see no reason for alarm at present.

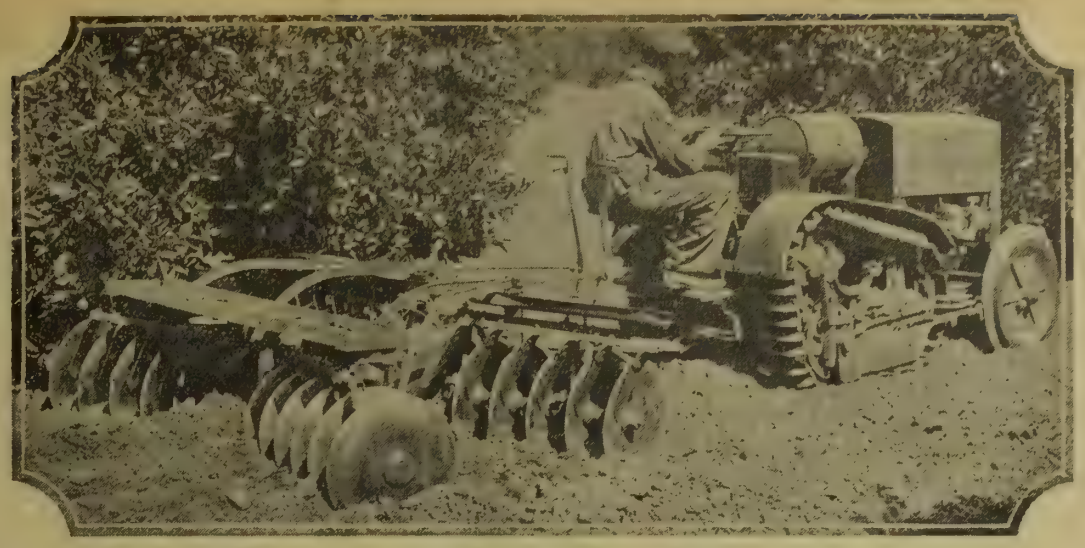
BAMBOO FOR USE IN AMERICA

Bamboo has been of great use in building and other operations in portions of China and Japan; in America it has been regarded simply as an ornamental. It certainly has great beauty as an ornamental plant, but now the department of agriculture suggests more economic use:

Possibilities of developing a bamboo growing industry in this country to meet the increasing demand for fancy fish poles, barrel hoops, canes, phonograph needles, furniture and many other uses are being worked out.

Bamboo shoots were brought to this country from China, Japan, India and other countries by the department ten or 12 years ago and cultivation was started at Chico, and Brooksville, Florida. A mite was later discovered on the sheaths, however, which sapped the vitality of the plants, and it was at first thought that the industry would have to be given up. But on study it was found that the mites could be destroyed with hot water without injury to the plants. Propagation of clean plants was then begun at Bell, Maryland, with a view to establishing large clean groves in the gardens at Savannah, Georgia.

Bamboo plants also suffer from a smut which is carried in the rhizomes or root sprouts from which the plants are propagated. Smut may be carried through the tissues of the plant and manifest itself in the new growth from which it is scattered by the wind, spreading the disease. Combating this disease is another of the obstacles which the department has overcome in developing what promises to be a profitable American industry.



". . . . . the best model tractor I know"

Says Mr. A. E. Rutledge, Monrovia, Cal.

Here is actual proof, straight from a user, that the Stockton is THE tractor for the orchardist or vineyardist. Mr. Rutledge tells us: "I have twenty-two acres of orange trees, set close together, and my Stockton easily works in every corner and easily pulls a six-foot disc."

The Stockton will do the same work for YOU on YOUR ranch. It has power, speed, durability. It is low, narrow, and powerful. It turns short—pulls hard. It will SPEED-UP your farm and orchard work.

Learn more about this tractor. Ask us for details. Let us send you facts, and the name of our dealer near you who will arrange for a demonstration. Ask for booklet D.

How to Learn Beekeeping

By Henry Perkins

THE proper answer to the above question is largely a matter of selecting the best available means at hand of learning the fundamentals. Of course the most practical way is to serve at least one complete season's apprenticeship with a practical beeman. This, with study of bee literature, should equip the beginner with a sufficiently reliable working knowledge to justify him in starting for himself on a moderate scale. Many state universities give very practical short term courses in beekeeping. The course given by the California University at Davis is very good.

However, less than half of our successful beekeepers have entered the game by either of these methods, for it is often impossible to lay aside other interests for an entire season and concentrate on bee culture. So the next best method is to buy a colony or two of bees, a veil smoker, a hive tool and a bee book and begin at home. Many of our most successful beekeepers received their first inspiration from a stray swarm which chanced to light on their premises. The home beginner should make it a point to acquire information in every available way. Cultivate the friendship of some practical beeman in your neighborhood and visit his yard from time to time as the season progresses. If there is a beekeepers club or association near you, join it. Subscribe for a bee journal. Get a bee supply catalog and study it to become familiar with equipment. The U. S. department of agriculture bulletins on beekeeping and bee diseases are especially good. Let your initial investment and efforts be primarily for the purpose of learning rather than for honey production. A working knowledge of the essentials is absolutely necessary. Luck will not get you by. Modern bee literature is indispensable, but it is of little value apart from the practical side of the study.

Bees and Equipment

Two or three colonies makes a nice start. If you lose one you will have some left from which to try your hand at increasing. Spring is the best time to buy bees. A minimum start may be made by buying a two or three frame nucleus with a queen and a hive which, if purchased in the spring, may be built up to a full sized colony by fall. Whatever you do be careful to get healthy stock. It requires experience to handle bee diseases. A beginner should provide his hives with comb honey supers for surplus. Extracting supers requires a considerable additional outlay for extracting equipment. In addition to bees and bee hives already mentioned you should buy a good bee smoker, a pair of bee gloves, a hive tool and bee brush. Do not be discouraged if you do not make a crop of honey the first year. If you fail to do so be satisfied if you have learned just why you failed.

Saving the Horse Bean Crop

Horse beans have been grown as an article of human food for a number of years in a few central coast counties and Sacramento County, but in recent years the beans have been so heavily infested with weevil that in 1915 the United States department of agriculture ruled that beans infested to any material extent "could not be shipped"; later in the same year this ruling was changed to "allow shipment of beans which did not contain more than 15 per cent of wormy or weevil infested beans." This stand of the federal government was endorsed by the state food and drug laboratory, so that beans could not be handled in interstate traffic or offered for sale as human food in this state without being liable to seizure. This placed a heavy handicap on the industry and large acreages formerly planted to this crop were abandoned. It is true that wormy beans could be sold as stock feed, for about the price of barley, which would be approximately a loss of 50 per cent of their value, a heavier discount than the crop could stand.

When beans are seized as exceeding the legal limit of infestation the grower has the privilege of hand picking and thus reducing the per cent of infestation, but the margin of profit is so small that this expense is seldom justified, and also the shipper is liable to fine for violating a food and drug act.

In the summer of 1918 four cars of the first seven which were offered for shipment were seized, as exceeding the legal limit, and the entire crop was so badly infested that it was with difficulty that a carload shipment of beans within the legal limit could be secured. An appeal to the University of California for assistance was made in August, 1918, and a campaign was begun in San Mateo County by E. R. de Ong cooperating with the state and county horticultural officials and federal and state pure food and drug departments. Suitable fumigation dosages were determined which were not dangerous to germination and were suitable for field use. Fumigation houses were established in Half Moon Bay and Pescadero, in charge of county officers.

The early horse bean crop produced this year at San Luis Obispo and Oceano districts was worse than in the past. At Gilroy production has almost ceased, while in the Sacramento district the crop was very small, apparently due to the heavy weevil infestation of the last two years.

CANARY ONION SEED

Consul F. A. Henry, Teneriffe, Canary Islands, reports January 15 as follows:

"The onion seed crop, 80 to 90 per cent of which always finds its market in the United States, furnishes the greater part of the exports from the Canary Islands to the United States and is therefore of more interest to American importers and growers than the leading crops of the islands.

"Production varies considerably from year to year, depending upon contracts placed the year previous by American seedsmen as well as upon natural conditions.

"Planting is done in October and November, and harvesting in June, July and August. Exportation to the United States usually begins early in July, and should be completed soon after the middle of August so that it reaches American onion growers in time for their fall planting.

"The three classes of seed grown for export are known as Yellow Bermuda, Crystal Wax and Red Bermuda. The bulk of the crop consists of the Yellow Bermuda. The Crystal Wax commands a higher price, but is especially sensitive and subject to damage during the growing season.

"Exports to the United States during the year (including a few small shipments to Porto Rico) amounted to 63,014 pounds valued at $103,360, the average value per pound being $1.63. The quantities and values of the different classes of seed were: Yellow Bermuda, 53,311 pounds at $82,359; Crystal Wax, 8,651 pounds at $19,598; Red Bermuda, 1,052 pounds at $1,403."

Household Department

MORE FIFTH READER

Some of the old McGuffey Reader selections already given in our columns are "Lord Ullin's Daughter," "The Tournament," "Last Sigh of the Moor," "Impeachment of Warren Hastings," "Faithless Nelly Gray," "South Carolina" and "Massachusetts." Since the time of these quotations a brand new original story written for Cultivator readers, together with a mass of information as to home made yeast, purifying lard, raised doughnuts, etc. has had possession. This week another quotation from a speech of Daniel Webster and "Ode to An Infant Son," by Tomas Hood.

ODE TO AN INFANT SON

Thou happy, happy elf!
(But, stop, first let me kiss away that tear,)
Thou tiny image of myself!
(My love, he's poking peas into his ear,)
Thou merry, laughing sprite,
With spirits, feather light,
Untouched by sorrow, and unsoiled by sin;
(My dear, the child is swallowing a pin!'

Thou little tricksy Puck!
With antic toys so funnily bestruck,
Light as the singing bird that wings the air,—
(The door! the door! he'll tumble down the stair!)
Thou darling of thy sire!
(Why, Jane, he'll set his pin-afore afire!)
Thou imp of mirth and joy!
In love's dear chain so bright a link,
Thou idol of thy parents;—(Hang the boy!
There goes my ink!)

Thou cherub, but of earth;
Fit play-fellow for fairies, by moonlight pale,
In harmless sport of mirth,—
(That dog will bite him, if he pulls his tail!)
Thou human humming-bee, extracting honey
From every blossom in the world that blows,
Singing in youth's Elysium ever sunny,—
(Another tumble! That's his precious nose!)
Thy father's pride and hope!
(He'll break the mirror with that skipping rope!)

With pure heart newly stampt from nature's mint,—
(Where did he learn that squint?)

Thou young domestic dove!
(He'll have that jug off with another shove,)
Dear nursling of the hymeneal nest!
(Are those torn clothes his best?)
Little epitome of man!
(He'll climb upon the table, that's his plan,)
Touched with the beauteous tints of dawning life,—
(He's got a knife!)

Thou enviable being!
No storms, no clouds, in thy blue sky foreseeing,
Play on, play on,
My elfin John
Toss the light ball bestride the stick,—
(I knew so many cakes would make him sick!)
With fancies buoyant as the thistle down,
Prompting the face grotesque, and antic brisk,
With many a lamb-like frisk!
(He's got the scissors, snipping at my gown!)

Thou pretty opening rose!
(Go to your mother, child, and wipe your nose!)
Balmy and breathing music like the south,
(He really brings my heart into my mouth!)
Bold as the hawk, yet gentle as the dove;
(I'll tell you what, my love,
I can not write, unless he's sent above.)
—Hood.

Speech on the Trial of a Murderer

AGAINST the prisoner at the bar, as an individual, I can not have the slightest prejudice. I would not do him the smallest injury or injustice. But I do not affect to be indifferent to the discovery and the punishment of this deep guilt. I cheerfully share in the opprobium, how much soever it may be, which is cast on those who feel and manifest an anxious concern, that all who had a part in planning, or a hand in executing this deed of midnight assassination, may be brought to answer for their enormous crime at the bar of public justice.

2. Gentlemen, it is a most extraordinary case. In some respects it has hardly a precedent any where; certainly none in our New England history. This bloody drama exhibited no suddenly excited, ungovernable rage. The actors in it were not surprised by any lion-like temptation upon their virtue, overcoming it before resistance could begin. Nor did they do the deed to glut savage vengeance, or satiate long-settled and deadly hate. It was a cool, calculating, money-making murder. It was all "hire and salary, and not revenge." It was the weighing money against life; the counting out of so many pieces of silver against so many ounces of blood.

3. An aged man, without an enemy in the world, in his own house, and in his own bed, is made the victim of butcherly murder for mere pay. Truly, here is a new lesson for painters and poets. Whoever shall hereafter draw the portrait of murder, if he will show it, as it has been exhibited in an example, where such example was least to have been looked for, in the very bosom of our New England society, let him not give it the grim visage of Moloch, the brow knitted by revenge, the face black with settled hate, and the blood-shot eye emitting livid fires of malice; let him draw, rather, a decorous, smooth-faced, bloodless demon; a picture in repose, rather than in action; not so much an example of human nature in its depravity and in its paroxysms of crime, as an infernal nature, a fiend in the ordinary display and development of his character.

4. The deed was executed with a degree of self-possession and steadiness equal to the wickedness with which it was planned. The circumstances now clearly in evidence, spread out the whole scene before us. Deep sleep had fallen on the destined victim, and on all beneath his roof. A healthful old man, to whom sleep was sweet; the first sound slumbers of the night held him in their soft but strong embrace. The assassin enters through the window, already prepared, into an unoccupied apartment. With noiseless foot he paces the lonely hall, half lighted by the moon; he winds up the ascent of the stairs, and reaches the door of the chamber. Of this, he moves the lock, by soft and continued pressure, till it turns on its hinges; and he enters, and beholds his victim before him. The room was uncommonly open to the admission of light. The face of the innocent sleeper was turned from the murderer, and the beams of the moon, resting on the gray locks of his aged temple, showed him where to strike. The fatal blow is given! and the victim passes without a struggle or a motion, from the repose of sleep to the repose of death!

5. It is the assassin's purpose to make sure work; and he yet plies the dagger, though it was obvious that life had been destroyed by the blow of the bludgeon. He even raises the aged arm, that he may not fail in his aim at the heart; and replaces it again over the wounds of the poinard! To finish the picture, he explores the wrist for the pulse! He feels it, and ascertains that it beats no longer! It is accomplished. The deed is done. He retreats, retraces his steps to the window, passes out through it as he came in, and escapes. He has done the murder; no eye has seen him, no ear has heard him. The secret is his own, and it is safe!

6. Ah! gentlemen, that was a dreadful mistake. Such a secret can be safe nowhere. The whole creation of God has neither nook nor corner, where the guilty can bestow it, and say it is safe. Not to speak of that eye which glances through all disguises, and beholds everything as in the splendor of noon; such secrets of guilt are never safe from detection, even by men. True, it is, generally speaking, that "murder will out." True it is, that Providence hath so ordained, and doth so govern things, that those who break the great law of heaven, by shedding men's blood, seldom succeed in avoiding discovery. Especially, in a case exciting so much attention as this, discovery must come, and will come, sooner or later. A thousand eyes turn at once to explore every man, every thing, every circumstance connected with the time and place; a thousand ears catch every whisper; a thousand excited

It's a "WESTCO"

—The Water System
Without a Tank

In the Westco, you get a complete automatic electric water system, which will enable you to have all the conveniences of the best city water works—a strong steady flow of water, delivered under ample pressure, to your laundry, kitchen, bathroom, or any barn or outside connection.

The Westco pump delivers so much water under strong pressure direct to the faucets that it will supply all the water you want, whenever and wherever you want it, without the use of any storage tank.

—no attic tank
—no elevated tank
—no pneumatic tank
—no tank at all!

The Westco pump has only one moving part—is the last word in simplicity—doesn't even need oiling. The pump, direct connected to an electric motor, together with automatic control switch, compression chamber and fittings and connections, make up the complete, compact unit—the Westco Tankless Water System.

The Westco operates by opening and closing the faucets—that's all you need to do.

It can be run off the regular electric light circuit or farm lighting plant. Costs less than 1 cent to pump 100 gallons of water with electric current rate 10 cents per kilowatt hour.

Thousands of Westco Systems are in daily successful operation. It will pay you to investigate.

minds intensely dwell on the scene, shedding all their light, and ready to kindle, at the slightest circumstance, into a blaze of discovery.

7. Meantime, the guilty soul can not keep its own secret. It is false to itself, or rather, it feels an irresistible impulse to be true to itself. It labors under its guilty possession, and knows not what to do with it. The human heart was not made for the residence of such an inhabitant. It finds itself preyed on by a torment, which it does not acknowledge to God nor man. A vulture is devouring it, and it can ask no sympathy nor assistance, either from heaven or earth. The secret which the murderer possesses, soon comes to possess him; and like the evil spirits of which we read, it overcomes him, and leads him whithersoever it will. He feels it beating at his heart, rising to his throat, and demanding disclosure. He thinks the whole world sees it in his face, reads it in his eyes, and almost hears its workings in the very silence of his thoughts. It has become his master. It betrays his discretion, it breaks down his courage, it conquers his prudence. When suspicions from without begin to embarrass him, and the net of circumstances to entangle him, the fatal secret struggles with still greater violence to burst forth. It must be confessed, it will be confessed; there is no refuge from confession but suicide, and suicide is confession.—Webster.

NEW USES FOR LEMONS

By Helen Chaffee Temple

AND now the problem of using more lemons comes along. We cannot eat very many lemons without danger to our dispositions, but I have found several uses for lemons in my household that otherwise I would have disregarded had the "lemon market stayed up."

I find that a cup of strained lemon juice added to a boiler of clothes on wash day bleaches and takes out stains as well as the commercial bleaches. It also softens the water. We, unfortunately, have extremely hard water and are compelled to use a great deal of lye and other softeners. I find that the juice of two lemons in my dish water makes unnecessary use of lye or other softeners. It is much better for the hands than commercial softeners.

I find that lemon juice combined with Bon Ami and water makes an excellent cleaner for white shoes. The lemon juice takes out the stains that otherwise would have to be covered up.

For discolored teeth lemons again come to the front. Cover the tooth brush with common baking soda, squeeze the juice of half a lemon over it and brush the teeth vigorously while the soda is bubbling. Repeat this two or three times and note the great improvement. The lemon juice also acts as a disinfectant. This treatment followed by the use of a pleasant tasting tooth paste or mouth wash leaves nothing to be desired.

A cup of lemon juice added to the mop water prevents the usual roughness of the hands caused by the mopping. It also helps remove the stains and spots from old linoleum floors.

Butter coloring is almost impossible to remove from oilcloth without spoiling the cloth. Accidentally I found that lemon juice removes this stain without injury to the oilcloth if used while the stain is fresh.

Lemon juice and salt will remove iron rust, while the pure lemon juice will remove ink stains and fruit stains from white goods.

We have known several persons troubled with occasional attacks of bilious headaches to prevent an attack by drinking a glass of strong unsweetened lemonade upon rising and omitting the largest portion of their breakfasts.

I find the easiest and one of the most delicious cake fillings and frostings is made of the juice of two lemons and powdered sugar. Strain the juice, adding enough of the powdered sugar to make an easily spread paste, then use immediately. The frosting will harden in a cool place within an hour.

Three or four lemons and enough orange juice to fill a quart jar, with about a half cup of sugar, brought to a boil, then sealed in a glass jar, will keep indefinitely. This juice, with a double amount of water, is one of our most delicious drinks. It has a flavor all its own. While lemons and oranges are so inexpensive we have made preparation for warm weather, namely, canning the juice. The culls of lemons and oranges can be purchased at the packing houses at prices ranging from 50 cents to $1 a box.

The rind of lemons was found to make an excellent dye for an old georgette crepe waist. Boil the lemon rinds until soft, strain the liquid through a cloth, then dip the waist. The waist must be thoroughly clean and damp.

There are many other uses for the lemon, such as lemon syrup for the itching cough, and lemon juice in a cup of black coffee for relief of a sick headache. Again, we find the lemon an aid to taking stains from the fingers during the fruit canning season. In fact, lemons are used in one way or another every day in households where the lemon habit is formed.

HOUSEHOLD QUERIES

Kumquat Marmalade

Please send recipe for kumquat marmalade published in Cultivator a year ago. I cut it out, then lost the clipping.—Mrs. E. Borchert, Anaheim.

One quart kumquats, two lemons, sugar, water. Quarter the kumquats and remove seeds. Slice lemons, rejecting seeds. Combine the fruits and let stand for 24 hours in twice their quantity of water. Place over a low heat in the same water and boil gently for one hour. Cool, add two cups of sugar to each pint of fruit and juice and boil gently till clear and thick. This amount will fill nine medium sized glasses.—Mrs. H. Fraser, Pasadena.

Wash and remove seeds. Slice very thin or put through the food chopper. (I do the latter, as it is quicker and just as good.) Weigh, and add same weight in water. Set away until next day. Then boil until tender in same water. Set away again. The following day boil thirty minutes. Weigh again and add same weight of sugar. Boil twenty minutes. Put in glass cans or jelly glasses.—Mrs. H. W. Hall, Grand Bay, Alabama.

India Relish

Answering further request of "Subscriber, St. Helena" for recipe for India relish: We have found in an old time cook book the following signed by "Admiral Schenck" who presumably has sailed the seas and brought back from the Indies the real thing:

One gallon best vinegar, 3 ounces salt, ½ pound flour of mustard, 2 ounces turmeric, 3 ounces white ginger, 1 ounce cloves, 1 ounce mace, 1 ounce each white and long peppers, 4 ounces chalots peeled, 2 ounces garlic peeled, 2 ounces cayenne pepper. Mustard and turmeric must be rubbed together with a little cold vinegar and stand until smooth. Add remainder of vinegar and put on stove. Stir in other ingredients just before it boils. As soon as it boils remove from fire. Let cool and it is ready for use.

Jelly Turns to Sugar

Can you tell me what makes my loquat and crabapple jelly turn to sugar a few weeks after it is made? The loquats I used were of the old seedling variety. I used the loquats before they were fully ripe and put in some lemon. Two cups of sugar to three cups of juice is the proportion I used. For the crabapple jelly I used three cups of sugar to four of juice. The jelly was nice and firm but turned to sugar. If you can help me will be much obliged.—A. B. Orange.

Note directions given by Mrs. Stainton in this department for making loquat jelly. There may be a hint there as to means of avoiding sugaring. The determining of exact amount of sugar required in making jelly from various fruits or the same fruits at different stages of ripeness or in different conditions requires also determination of relative pectin and acid content. We will give next week, if space permits, or as soon as possible, in this department simple means of determining this as given by Prof. W. V. Cruess in a leaflet issued by the

The Cultivator Patterns

BE SURE TO SEND SIZE

3536-3539. Ladies Costume.—Waist 3536 cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Skirt 3539 cut in six sizes: 24, 26, 28, 30, 32 and 34 inches waist measure. A medium size will require 8½ yards of 36 inch material for tunic, waist and skirt of one material, with ¾ yard of contrasting material for collar and cuffs. The skirt measures 1⅞ yard at its lower edge. TWO separate patterns, 10 cents FOR EACH pattern.

3532. Child's Play Suit. Cut in four sizes: 2, 4, 6, and 8 years. A 4 year size will require 2¼ yards of 36 inch material. Price 10 cents.

3115. Dress for Work or Leisure. Cut in seven sizes: 34, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 38 will require 5¾ yards of 36 inch material. The width of the skirt at lower edge is 2 yards. Price 10 cents.

3533. Girl's Dress. Cut in four sizes: 6, 8, 10 and 12 years. A 10 year size will require 3¾ yards of 27 inch material. Price 10 cents.

3552. Misses' Dress. Cut in three sizes: 16, 18 and 20 years. An 18 year size will require 6 yards of 38 inch material. The width of the skirt at the foot with plaits extended is about 2½ yards. Price 10 cents.

3549. Boy's Play Suit. Cut in four sizes: 2, 3, 4 and 5 years. A 4 year size will require 2½ yards of 36 inch material for the Overalls and 1½ yard for the Blouse. Price 10 cents.

3054. An "Easy to Make" Apron. Cut in one size, medium. It will require 1½ yard of 27 inch material without tie strings. Price 10 cents.

3534. Girl's Dress. Cut in four sizes: 8, 10, 12 and 14 years. A 12 year size will require 4⅛ yards of 36 inch material. Price 10 cents.

PRICE OF ANY OF THE ABOVE PATTERNS 10 CENTS EACH

How to Order Patterns

Write your name and address plainly in full, give correct number and size of each pattern you want, and send 10 cents in coin or (1 or 2 cent) stamps for each number. In order to furnish our readers with the very best NEW YORK styles, all patterns ordered are filled in NEW YORK. Therefore, we promise to deliver all patterns ordered within TWO WEKS; we guarantee safe delivery of all patterns. Address

PATTERN DEPARTMENT
California Cultivator
Los Angeles

agricultural experiment station of the University of California, Berkeley, published August, 1917. This is an illustrated leaflet giivng clear and concise directions for making fruit juices and jellies, and one who is interested could do no better than write to the station for it. Copies will be sent free to any resident of the state if the supply is not exhausted.

Sugar Pie—Butterscotch Pie?

The California Cultivator has been such a help to so many that I too would like assistance. Can you give me a recipe for sugar pie and butterscotch pie? They would be much appreciated.—Mrs. L., Winters.

Butterscotch Pie.—Line pie tin with plain pastry and then place in saucepan 3 tablespoons butter, 1 cup brown sugar. Heat slowly and cook 3 minutes. Then place 1½ cups cold milk in bowl and add 4 level tablespoons cornstarch to milk. Stir to dissolve starch; add to cooked sugar and stir constantly to thoroughly blend. Bring to boil and cook 3 minutes. Cool and add 1 well beaten egg. Pour mixture into the prepared pie plate. Care must be taken not to let sugar caramel.

Who can give us a good recipe for sugar pie?

HINTS FROM HOUSEKEEPERS

Ink Stain on Gingham

Wet thoroughly in common coal oil, then put in water with some good soap powder or soap rubbed on stained spot and rub out at once.—Mrs. J. W. Payne, Florence, Arizona.

Easter Cakes for the Children

I saw some candy nests with eggs in them in a store window this morning which would make pretty Easter gifts for the children. Make small cakes from any favorite recipe and cover with frosting. Before the icing dries place three or four little candy eggs of different colors in the center and arrange shredded coconut around them to form nests.—Mrs. A. Stainton, San Francisco.

Loquat Jelly

Gather loquats when full sized but still hard and only partially turned in color. Wash and remove blossom ends. Cover with water and cook till soft. Strain through a cloth. Boil juice down till thick and cherry colored, when add heated sugar, pint for pint, gradually. When sugar is thoroughly dissolved, boil a few minutes and test by letting small quantity cool in small dish.—Mrs. A. Stainton, San Francisco.

Raised Doughnuts

I notice in the home department a housewife asks for the recipe for raised doughnuts "like those you buy." I enclose the following, which I find very satisfactory, even better than those you buy:

Two cups yeast, ¼ cup sugar, shortening the size of an egg, nutmeg (to suit taste), 3 eggs (or less). Let rise three times.

We are new subscribers and enjoy your paper, especially the home department.—Subscriber, Exeter.

Raised Doughnuts

In reading the Cultivator I see you are asking for a good raised doughnut recipe. This one is very good; it sounds rather complicated but it really isn't more trouble than any ordinary recipe.

One cup shortening, 2½ cups sugar, 2 cups mashed potato, 2 yeast cakes dissolved in one cup of warm water, 1 pint milk, 2 eggs. Cook potatoes, mash light, add the sugar while the potatoes are hot, beat until the sugar is dissolved. Bring the milk to the scalding point with the shortening in it; slowly stir milk and shortening into the sugar and potato, add the well beaten eggs. When cool enough add the yeast. Put in a warm place to rise. When light, add flour enough to make a dough as one would use in making bread. Let this mixture rise. When light, cut out in any desired way, round or square pieces, let rise again and fry in deep fat. Fleishman's yeast should be used. It takes several hours for the whole process, but if care is taken to allow them to get light each time, one will be paid for their trouble, for they are exceptionally good. This is a very old recipe and one that never fails.—A. B. C., Arroyo Grande.

Old Fashioned Yankee Doughnuts

I am sending a recipe for raised doughnuts, although they are not "like those you buy," but better. These are called the "Old Fashioned Yankee Doughnuts" and are very good. One pint of warm milk and one cup of yeast, enough flour to make a sponge. Let rise over night. In the morning add 1½ cups of sugar, ½ cup of shortening, 2 eggs, little salt, teaspoon soda (scant), flavor with nutmeg. Mix in enough flour to make a soft dough, roll out and cut with a small biscuit cutter. Let rise in warm place three or four hours, and fry in fat grease. I think the kind you buy are just plain bread dough.—Mrs. W. H. C., Baldwin Park.

Very Light Doughnuts

I have just read of the wish of your Vacaville subscriber for a recipe for "raised doughnuts like those you buy." I am sending a tested recipe and if followed carefully am sure it will give perfect satisfaction.

One cup lard, 1 cup sugar, 8 cups flour, 2 cups milk, 1 cup warm water with 1 cake compressed yeast dissolved in it, 2 eggs, 1 saltspoon salt, nutmeg to taste. Put lard in milk and warm. Add yeast dissolved. Add all other ingredients and beat a long time. Raise over night. Mould down and cut out. Let get very light so they will not sink when put in deep hot lard.—M. M. S., Lankershim.

Raised Doughnuts

Notice in your columns Subscriber, Vacaville, wants recipe for raised doughnuts, "the kind you buy," so am sending mine, which I think is better than the kind you buy:

One cake Fleischman's yeast, 1¼ cups milk scalded and cooled, 1 tablespoon sugar, 4½ cups sifted flour, ½ cup sugar, 3 tablespoons butter, ¼ teaspoon mace, 1 egg, ¼ teaspoon salt.

Dissolve yeast and sugar in lukewarm liquid, add 1½ cups flour and beat well. Cover and let rise in warm place till bubbles burst on top. Add butter and sugar creamed, mace, egg well beaten, remainder of flour to make moderately soft dough, and salt. Knead lightly. Place in well greased bowl. Cover and allow to rise again in warm place about 1½ hours. When light, turn on floured board, roll to about one-third inch thickness. Cut with small doughnut cutter, cover and let rise again on floured board or paper in warm place until light—about 45 minutes. Drop in deep fat with side uppermost which has been next to board. Excellent.—Mrs. F. A. Paugh, Glendale.

Raised Doughnuts

In reply to inquiry from "Vacaville Subscriber" about making raised doughnuts, I am sending the following which I have used and found satisfactory:

Two cups milk, 1 cup sugar, ½ cup butter, ½ cup lard, 1 cup sponge yeast and 2 eggs. Add enough flour to make a pretty stiff dough, which must rise. When the doughnuts have been cut out let them remain on the baking board until they rise again and then cook in your favorite shortening. Dip while still hot in powdered sugar.—Mrs. Carl Froberg, El Cajon.

How to Boil Ham

Am writing you about article in your issue of March 5 about boiling a ham. I have had considerable experience in cooking and catering to different fraternal societies and everybody praised my sandwiches.

Take a five gallon oil can for boiling and put something in bottom to keep ham from burning. Cut open joint and place ham in, put in one tablespoon of good soda and cover with water. After it comes to boiling, boil for an hour, take out and wash off all impurities the soda has brought out, put in clean water again and boil for one and one-half hour, take out and remove the skin, cover with same and let drain and cool. Cut off all surplus fat and render for cooking. The meat will retain its natural color and is good. Try it and be convinced. —C. A. Howard, Reno, Nevada.

Livestock News Notes

LIVESTOCK SALE CALENDAR

Holsteins

April 6-7, Fred W. Kiesel, Sacramento.
April 14, R. F. Guerin, Tulare.
April 21-22, Santa Anita Rancho.
April 21 and 22—Santa Anita Rancho, Los Altos.
April 20-21, Toyon Farm Association, Los Altos.
April 26, Santa Anita Rancho, Santa Anita.
May 11, Victory Herd, Carruthers.

The Bridgford Holstein Company of Patterson has recently sold the young bull, Chief Abbekerk Paul, to Shuster Bros. of Wisconsin. This calf was sired by King Abbekerk Johanna Segis, a son of Adirondiac Wietske Dairy Maid, and his dam is the 39 pound four year old, Fairmont Pauline De Kol 2d. It will be remembered that Adirondac Wietske Dairy Maid holds the Pacific Coast record with 41.02 pounds of butter in seven days and that she finished a 365 day test with 1,296.5 pounds of butter to her credit.

A. W. Nolan of Forestville has purchased a young Jersey bull sired by a son of Poppy's St. Mawes, whose dam, St. Mawes Poppy, has record of 952.88 pounds fat from 15,782.4 pounds milk. The dam of the Nolan bull is St. Mawes Susy with 873.6 pounds fat to her credit.

John Troup, manager of the Rancho St. Julian herd of Shorthorns, Santa Barbara, reports strong demand for bulls. This herd has recently furnished bulls to the following buyers: four to the Rowland Cattle Company, Walnut; a like number to the Bishop Company, Los Alamos; five to Chas. James, Cerissa Plains.

The late sale of Shorthorns held at Klamath Falls averaged $211.

John E. Dugan, formerly in charge of the Allana Holstein herd, is now with the Palo Alto Stock Farm and reports several very excellent records.

The animal husbandry division of the college of agriculture has sold a Jersey bull calf to Sinsheimer Brothers, San Luis Obispo. The dam of the calf has a record of 624 pounds fat.

Fifty-four Holstein cows in the herd of Fred W. Kiesel, Sacramento, averaged 42.84 pounds of butterfat for the month of February and had the honor of holding the first ten places in the Sacramento-Yolo Cow Testing Association for that month.

Sheepmen of Northern California have organized a corporation for the warehousing of this year's wool crop. The following officers and directors have been elected: President, F. A. Ellenwood; vice-president, J. W. Howell; secretary, E. L. Hart, all of Red Bluff; directors, F. A. Ellenwood, J. W. Howell, E. L. Hart, G. B. Wilcox and A. N. Montgomery, all of Red Bluff; Ray Houghton of Corning, Charles Hanson of Butte City and R. H. Bronell of Orland.

Fred Hartsook of Lankershim, whose activities in Holstein affairs in this state during the past year have been of such notable character, has announced that he has been successful in purchasing the heifer, Miss Aralia De Kol Mead, for what is understood to be one of the highest prices ever paid for a heifer of her age in the history of the breed. Miss Aralia De Kol Mead was bred by A. W. Morris & Sons of Woodland and sold in the St. Paul sale to Brentwood Farm, Philadelphia. She is sired by Sir Aaggie De Kol Mead and is out of Aralia De Kol Mead 2d with 851.01 pounds butter from 18,785.6 pounds milk as a junior two year old. Her seven nearest dams average over 1,000 pounds of butter and she, together with Miss Aralia De Kol Aaggie, her 100 per cent sister, are the only two heifers of like relation in the world whose seven nearest dams average over 1,000 pounds of butter. It will be recalled that Mr. Hartsook recently purchased Miss Aralia De Kol Aaggie from W. J. Higdon of Tulare at a record price. The ownership of these two famous sisters places their owner in a very strong position and will undoubtedly result in bringing additional fame to California Holsteins.

G. A. Moore of Ripon writes: "I wish to report the loss of Empress Lass, the Jersey cow which won first and grand champion at Oregon, Washington and California state fairs. Some consolation, however, in having two promising daughters from her. The loss was due to bloat, getting out in the night and filling up on green alfalfa."

Wins Cultivator Prize Again

Five grade cows owned by Earl Graham of Compton had the highest average production of butter fat for grades in the state dairy competition during the month of February, and the California Cultivator prize for this month was therefore awarded to him.

The production of the individual grades for the month was as follows:

	Yr.	Mo.	Days in Milk	Lbs. Milk	Pct.	Butterfat Lbs.	Credit
Brownie, gr. H.	3	4	30	2,050	3.9	79.95	94.42
Montana, gr. H.	aged		37	1,817	3.3	59.96	59.96
Alice, gr. H.	2	6	37	1,646	3.5	57.61	71.46
Smithy, gr. H.	4	6	11	1,834	3.1	56.95	59.80
Niger Heifer, gr. J.	3	5	5	1,688	3.3	55.70	69.83
Average			24	1,807		62.03	71.09

This is the third group of five grades in Mr. Graham's herd that has won this prize. Five grade Guernseys, owned by Adohr Stock Farm of Van Nuys, had a higher production, 69.45 pounds butterfat, but being all aged cows they receive credit for this production only. Other groups of five grades eligible to compete for the California Cultivator prize produced on the average as follows: F. F. Pellissier, Whittier, 61.76 pounds; R. H. Walrath, El Centro, 59.50 pounds; Napa State Hospital, Imola, 56.53 pounds; Los Angeles County Farm, Hondo, 55.90 pounds; C. E. Fisher, Hughson, 45.05 pounds; J. M. Christen, Pacheco, 40.79 pounds; S. G. Gambonini, Petaluma, 38.83 pounds; University Dairy, Berkeley, 38.51 pounds. While the production of the grades in the last two herds is greatly below that of the prize winning and several of the other competing groups of grades, it represents at least twice the average production of the dairy herds in the state and exceeds that of most good dairy herds by at least 25 per cent.

Entries in the state dairy cow competition close on the 31st inst. Cows due to freshen during the next month or two may, however, be entered prior to April 1 and their records may commence on the fifth day from freshening. Entry blanks and further information concerning the competition will be furnished upon request. Address Prof. F. W. Woll, Superintendent of Dairy Tests, University Farm, Davis, California.

HOW LONG SHALL A COW REST?

This question is of much importance to every dairyman. A rest from milk secretion is of course for the benefit of the cow, her prospective offspring and of the milk yield after the production of the calf, for it is certainly not in accordance with the arrangements of nature for a female to be always producing milk, and continual secretion is a terrific strain on her system where no opportunity is allowed for recruiting, says a writer in the Indiana Farmers Guide.

In the case of the poor milk producer which in these days of high pressure no one should keep as a dairy animal, there is no difficulty about fixing the period during which she should be dry—she simply goes dry herself and generally much too soon for her owner. Some will take as much as three or four months rest or yield in response to generous feeding a quantity of milk that does not pay expenses. The shortest and best way with animals of this class is to weed them out, for they are quite out of place in a modern dairy.

A cow in poor condition may be allowed two months in which to recruit her strength with advantage to herself and her prospective calf, but this is to some extent a matter of keep, for the poor cow generally belongs to the poor feeder. If the feeding is generous, the animal in a healthy condition and the milk produced pays expenses, there is no reason why the period of rest should not be further reduced. In the case of the average cow the milking can be continued until within a month of calving. If a

cow is in poor flesh condition it is better, in my opinion, to resort to higher feeding than to dry her off. I have known cows treated thus for years being milked to within a month of calving that have carried as good an appearance and produced equally good calves as those which run dry three times as long. Six weeks may be considered the average period during which a cow should be dry.

It is, however, the extraordinary milker that occasions the greatest difficulty to the dairyman fortunate enough to possess her, both as to the policy of her drying at all, and in the way in which the secretion is to be stopped without incurring great risk of injury to the udder and possible loss of secretive function in parts of the gland structure. I would prefer to continue milking such cows right up to the time of freshening. So far as immediate consequences are concerned animals of this class appear none the worse by continuing the milking nor is the milk yield after calving materially affected.

In the case of heifers they should never be permitted to go dry early or the habit of ceasing the milk supply early may be perpetuated. They should be kept giving milk even when the yield falls below a profitable quantity, for it is by persistent asking for more that the qualities of prolonged lactation have been developed in the cow.

SCRUBS TEACH HIM A LESSON

There was a man who heard about "better sires better stock" years ago, before the present movement was started. He was so impressed that he thought he would get a purebred bull and have a good herd. The bull he got was a good one, but the next year the herd was no better than before, and he became discouraged. He kept his purebred bull for one more year, then sold it and bought a scrub.

Time went on, and the heifer calves from cows served during those two years when the pure bred bull was used grew up and came into milk. To his surprise he found that after all he did have a better herd. But alas, in two years more he found that his herd was growing poor again. The cheap bull was getting in his work. The scrub then died, but his influence remained, just as the good bull's influence remained after he was gone.

At last this farmer saw the point. Again he bought a purebred bull, one whose dam and granddam had high records, and before two years had passed he joined a bull association, so that when he had to quit using his own purebred bull he was able to change off to another bull as good. When the daughters of this bull grew up he found his herd again improving in quality, and this time it kept on improving. Year after year his heifers grew up to be high class cows, and the owner profited.

Charter Members Humboldt County Guernsey Breeders Association

The Guernsey breed has been making rapid advances in Humboldt County the past few years and for that reason the dairymen of that section decided it would be a good place to organize a breed association. Its charter members are shown in the above photograph. Top row left to right: Iver Iverson, Arcata; J. W. Nelson, Assistant State Leader County Agents. James H. McCloskey, Arcata. W. A. Beer, Arcata. Second row: W. W. Turner, Arcata; W. Vinal Hunt, director, Arcata; Wm. Danphiny, Ferndale; Chas. Ford, director, Arcata; Dr. J. W. Logan, farm advisor Humboldt County. Seated left to right: C. S. Rasmussen, president, Loleta; S. B. Morrison, vice president, Ferndale; E. L. Westover, Western representative American Guernsey Cattle Club; L. D. Smith, secretary-treasurer, Hydesville.

75 Holstein Cows and Heifers 75

"THE QUALITY KIND"

This sale offers you an opportunity to purchase cows from one of the heaviest producing herds in California. The milking herd is producing an average of TWELVE THOUSAND POUNDS of milk a year per cow. The cows are all young; they are great big, fine individuals, full of quality and a square uddered lot throughout. Every cow is a heavy and persistent milker. You couldn't ask anything better as to color markings. Your particular attention is called to the

HOLSTEIN HEIFERS TO BE SOLD

as they are a splendid lot, the making of a wonderful dairy herd. All sired by registered sires and selected from dams who are tremendous producers. Heifers of this quality are scarce. The ages are yearlings and two year olds.

E. W. Badger, Owner **Rhoades & Rhoades, Auctioneers**

DISPERSAL SALE

Tarzana Championship Hampshire Herd

At the Tarzana Ranch on the Ventura Blvd. at Reseda Ave., 11 miles west of

UNIVERSAL CITY

Los Angeles County

Thursday, March 31st

at 10 A.M.

It is seldom that an opportunity such as this is offered to buyers looking for the best in pure bred Hampshire hogs. The herd name of Tarzana Championship Herd is well earned. At the Los Angeles, Riverside, Ventura and Owensmouth shows last fall this wonderful herd won

EIGHTY FOUR RIBBONS

divided as follows:

FOUR GRAND CHAMPIONS

SEVEN CHAMPIONS

ONE RESERVE GRAND CHAMPION

31 Firsts—19 Seconds—17 Thirds—2 Fourths—3 Fifths

Not only are these Hampshires prize winners but a study of their pedigrees shows that they are backed up by prize winners. This sale offers the new beginner or the established breeder an opportunity to secure Hampshires of quality second to none.

All cholera immunized, double treatment.

Make your arrangements to attend the complete dispersal sale of the

Tarzana Championship Hampshire Herd

Edgar Rice Burroughs, Owner

Rhoades & Rhoades, Auctioneers

Buyers Attention

If you are contemplating the purchase of dairy cattle or heifers, arrange to attend these large sales. There are other smaller sales also during the week. Arrange to attend them all. Buyers wishing to ship out can assemble their cattle at the Rhoades & Rhoades Stock Yards at Hynes. Every possible assistance will be given the buyer to get what he is looking for.

If you are contemplating holding a public sale of dairy cattle it will pay you to get in touch with us as we are prepared to render you sales service second to none. Write or wire us for dates and terms.

SANTA ANITA RANCHO
First Individual Public Sale

60 REGISTERED HOLSTEINS

Santa Anita Rancho, Santa Anita, Cal.

Tuesday, April 26, 1921

INCLUDING:

SUNDRIE SUNBEAM GIRL, the famous dam of triplets, that made over 1000 lbs. butter last year after dropping triplets.

THE HIGHEST RECORD COWS in the herd, including a 35 lb. cow, a 34 lb. cow, and daughters of 1000 lb. and 1100 lb. cows.

MANY FEMALES BRED TO THE $41,000.00 KING KORNDYKE PONTIAC ACME, the earliest and best opportunity to select highly bred females in calf to this outstanding young sire.

TWO HERD SIRES TO BE SOLD

MERCI LAD KORNDYKE BURKE, son of De Kol Hengerveld Burke and the first cow to make over 1200 lbs. butter in one year in California. He was Grand Champion at 1920 California State Fair, and now has a 30 lb. 4 year old daughter.

PRINCE WALKER CORNUCOPIA, son of Prince Gelsche Walker and the 36 lb. cow Alba Sadie Cornucopia Creetia, who also made 866 lbs. butter in one year at a previous freshening. He is a high class individual and would not be sold except that in the reduction of the herd the service can be handled by King Korndyke Pontiac Acme.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and sold subject to retest by the buyer.

DISPERSAL SALE
R. F. Guerin Herd

60 REGISTERED HOLSTEINS 60

Visalia, Cal., April 14, 1921

This is a herd of young cattle, and contains a large group of daughters of Sir Veeman Korndyke Pontiac, 30 lb. son of Sir Veeman Hengerveld.

SIR VEEMAN KORNDYKE PONTIAC has a nice list of A. R. O. daughters, including one that made over 21,000 lbs. milk in one year as a 2 year old, and she has just made over 33 lbs. butter in 7 days as a 3 year old in the herd of Earl Graham, Compton. Two other daughters, both 2 year olds, and both in this sale, are now finishing excellent yearly records at Burr Farm, Los Angeles.

The younger females in the herd are largely daughters of KING SADIE VALE IDYL SEGIS, a son of King Korndyke Sadie Vale 27th, and a 35 lb. 3 year old daughter of King of the Pontiacs.

Besides these two large groups there are daughters of KING MORCO ALCARTRA, KING SEGIS PONTIAC JANNEK, KING SEGIS ALCARTRA PRILLY, and other popular sires.

KING TOLA KORNDYKE PONTIAC is an outstanding young bull in this sale. He is sired by the $12,000.00 King Korndyke Pontiac 20th, and is out of K. P. Tola, 36.16 lb. daughter of King of the Pontiacs, now making a yearly record at Burr Farm that promises to go over 1000 lbs. butter. He is a first class individual and ought to head a good herd.

Every animal positively guaranteed to be a breeder; every animal over six months old tuberculin tested and individual certificates furnished buyers.

Write for catalog now.

Feeding for Advanced Registry Records

By Professor F. W. Woll

VARIOUS inquiries have been received of late as to the best method of feeding cows for advanced registry records. As the subject is of interest to all owners of pure bred stock as well as to owners of grade cows who are planning to start these on test for the grade registry of production which is now kept by the college of agriculture, a brief discussion is given below along this line. It is hoped that this will be of interest and value both to the dairy farmers referred to and to dairymen who have entered cows in the state dairy cow competition, or contemplate doing so.

The kind of record a cow will make will depend to a large extent upon her condition at freshening; if she comes through calving in thin, emaciated condition her flow of milk will be smaller than if she is in good flesh at this time, and, what is equally important, the fat content of her milk will be low, sometimes as much as one per cent or more below normal. To secure a large production of milk and butter fat, either soon after freshening or during the entire period of lactation, the cow must be in good flesh at calving time. This may be brought about by feeding a liberal grain ration during the dry period. Many breeders aim to get their cows "hog fat" at this time, and experience has shown that dairy cows in this condition will as a rule milk off this surplus fat during the first few weeks after freshening, and the milk will test considerably higher than later in the lactation period. The danger of milk fever in cows in a high condition of flesh is now largely removed since the air treatment became generally known, and high feeding of cows that are especially fitted for advanced registry tests is now a common practice among dairy breeders.

Fitting rations may include a variety of concentrates, like barley, mill feed, coconut meal, Indian corn or milo, with some linseed meal to keep the bowels in good condition. The amount of grain feed given at this time may vary from a couple of pounds per head daily to eight to ten pounds in case of large cows that need a good deal of nourishment to reach a fat condition.

After freshening dry feed is withheld for a day and only bran mash given to insure loose bowels. Hay is next placed before the cow and a small allowance of grain feeds is fed which is gradually increased as the flow of milk increases. Some cows will reach a full flow in a week or two, others take twice this time or more to reach a maximum yield, and the system of feeding must be governed accordingly. Experienced breeders are careful not to force a large production very soon after freshening unless a seven day record only is wanted. In this case, a maximum production of butter fat may often be secured during the first couple of weeks through an exceptionally high fat content rather than a large mess of milk. But for cows on long time tests it will generally prove a mistake to try to reach a heavy production soon after calving by means of forced feeding.

The character of the ration to be fed is important, but in feeding for high records the cost is only a secondary consideration. Most dairymen feed their test cows the best that the market affords without much regard to cost. It is advantageous to feed a variety of different feeding stuffs as this will insure a good healthy appetite and keep the digestion in good order. It is also important in its effect on the general health and vigor of the cow and of her offspring. A mixture of common standard feeding stuffs is all that is needed in feeding test cows as for good dairy cows in general. In addition, a good quality of hay and some succulent feed, either green feed, silage, or roots, are valuable components of rations for test cows. Green feed or silage are ideal milk producing feeds, but if not obtainable, roots are equally good, either half-sugar mangel or sugar beets, although as a general rule they are more expensive crops on account of the smaller yields of food materials they furnish per unit of land and the greater cost of production, at least outside of the north coastal region. Roots have a special value in feeding test cows. They are mildly laxative and are believed to have a cooling effect on the system and enable cows to eat large amounts of grain feeds without any deleterious effects. Eastern breeders often feed large quantities of fodder beets to cows on test, sometimes as much as 100 pounds per day. Fifty to 60 pounds, however, is an average amount. There is no safer or more wholesome feed for heavy producing milk cows than roots. The dairyman who can provide a good supply for his test cows has a marked advantage over those who have no roots or other available succulent feeds.

A good dairy cow is a hard working animal, and in order to reach and maintain a large production she must receive an abundance of palatable, easily digestible and highly nutritious feed. The grain ration to be fed will vary greatly with local conditions. The following mixture may be considered an ideal one for test cows in this state, viz., barley, wheat bran (mill run or middlings), coconut meal, and beet pulp, equal parts by weight or two parts of barley to one of each of the other components. An addition of one-half to one pound of linseed meal will still further improve the palatability and efficiency of this ration. The proportions of the different feeds may be changed to suit different market conditions, and the number of different components may also be reduced without seriously affecting the efficiency of the

ration. If a good quality of alfalfa hay is available the protein supply of the grain ration need give no special concern, but if grain hay or some other roughage of medium or low protein content is fed it is advisable to increase the proportion of protein feeds in the mixture, like coconut meal, cottonseed meal or linseed meal, so as to furnish an ample supply of protein which is an essential in the feeding of high producing cows. The casein of milk is a protein substance which can only be produced from protein in the feed; the higher production a cow makes the more protein will she require in her feed, relatively as well as absolutely. Where alfalfa hay is fed an ample supply of protein is secured in the ration even with only a medium allowance of protein concentrates.

The amount of grain feed to be fed will depend on the capacity and the production of the cows and can only be determined satisfactorily by watching carefully each indiivdual cow and noting how she takes her feed. If she eats up everything placed before her right away and looks around for more, the grain ration may be safely increased, for the more feed a good dairy cow will eat the more milk she will produce. When her appetite seems sluggish and she begins to leave feed in her manger, it is time to look out and reduce the amount of feed before she gets off feed. If a cow loses her appetite the game is up for the time being, and it will take time and watchful waiting to bring her back to where she was, both in feed consumption and production.

In ordinary dairy practice good cows are generally fed a pound of grain feed for every four or five pounds of milk they yield, but test cows may be fed at least a pound to every three pounds of milk, especially if the cow gives milk of a high fat content. Since this varies more than 100 per cent, the better method to gauge the amount of grain to be fed is to feed according to the production of butter fat, say seven pounds or more per pound of fat. Many Holstein breeders think nothing of feeding their cows large amounts of grain, say 20 to 24 pounds per head daily, but most test cows are not fed over 15 to 18 pounds of grain daily unless they are exceptional producers, yielding some three to four pounds of butter fat daily—"30 or 40 pound cows" in Holstein parlance.

The circular on feeding dairy cows, issued by the college of agriculture, contains suggestions for different grain mixtures and gives a general discussion of the subject that should prove helpful, at least to inexperienced dairymen. Both this circular (No. 215) and Bulletin No. 323 on "Heavy Versus Light Grain Feeding for Dairy Cows," recently issued, may be obtained on application to the Director of the Experiment Station, Berkeley.

Where a cow has not been on test before, daily weighings of the milk with at least occasional testing of it and weighing or measuring of the grain feed will furnish valuable information as to the way she responds to her feed and will give a definite guide as to changes in the method of feeding that may be desirable. The all important point to keep in mind, however, is to supply all the feed the cow can take care of and to guard against overfeeding. The successful feeder is one who has the intuition and the patience to stay by the cows and watch them early and late to see that they get all the feed they can eat without going off feed, and no more. It is this that brings about a maximum record breaking production which is the fond hope and aim of most dairy breeders.

Favorable feed conditions are a most important factor in feeding test cows, but there are others, like giving access to fresh drinking water and salt, occasional currying and brushing, keeping the cows comfortably stabled, preferably in separate box stalls connected with a small dry, protected runway where they may get fresh air and a little exercise. These are all things that help, but, fortunately for the many breeders who cannot provide every convenience, they are not essential. A liberal and intelligent system of feeding and careful handling of the cows are, however, essential for the making of high records. It does not necessarily require a big bank account to provide these, but the man behind the cow must know his cows and his business to accomplish anything remarkable in the way of record making.

WEAVING THEIR OWN WOOL

Starting with the object of providing Vice President Coolidge with wearing apparel of native wool, a Massachusetts farm bureau now plans to have the entire clip of wool owned by the association manufactured into cloth and sold locally.

After the national election the farm bureau in Berkshire County, which had pooled its wool clip and stored it with a cooperative association, arranged with a local woolen manufacturer to have some of the selected wool woven into cloth. A tailor in the county made an overcoat for the vice president from it.

The Franklin County farm bureau, not to be outdone in a matter of this sort, arranged to have made from selected wool a piece of cloth which was afterwards made into a suit of clothes and presented to Mr. Coolidge. This bit of enterprise on the part of the Franklin County people suggested the idea of manufacturing all of the wool in their pool into cloth and selling it locally to farmers or others who might be interested, which would result in all wool growers getting a fair price for their wool and the local people having the satisfaction of wearing clothing made from virgin wool from their own sheep. Farm bureau officials regard this as a possible solution of handling at least a part of the wool clip held in the various county and state pools, especially in New England where the grower is so accessible to the woolen factories.

FREEDOM

Like autumn leaves
My buttons fall away,
My shirts and socks
All haste to swift decay.

Bacon and toast
Each morn I carbonize;
They burst in flame
If once I turn my eyes.

The faucets drip—
They drip and never cease.
Each plate and dish
Is filmed with horrid grease.

The bread-knife's cut
My finger to the bone—
My wife's away,
I'm keeping house alone.
—John F. Haylock.

Gombault's Caustic Balsam

A VOLUNTARY RECOMMENDATION AFTER YEARS OF EXPERIENCE FROM A MAN OF HIGH BUSINESS STANDING WHO KNOWS RESULTS CAN BE OBTAINED WITH THIS GREAT EXTERNAL REMEDY.

Urbandale, Iowa, January 12, 1921.

My letter to your company of December 30th, last, was written purely as a motive to spur you on in advertising "Caustic Balsam" for treatment of the diseases named in that letter. I might say that at the very time I was writing, my son seventeen years old was laid up with pneumonia, being his third attack. I was at that time banking on Caustic Balsam to save him, as it had done twice before with him and once with Mrs. Rice, and he is now fast recovering and able to sit up, and this adds another victory for this, the greatest of all remedies.

After twenty-one years of actual experience with this liniment I have used probably one hundred or more bottles and under all conditions, with never a failure. I used the wool felt pads, one on the back and one on the chest, using a half bottle on each pad at a time, keeping them soaked; they raise a blister, but simply leave them alone and they will disappear. There is no burning nor inconvenience noticeable to the patient.

There is no use half-way doing it, as there is absolutely no danger of leaving sores. In four to five days after ceasing to use it, the pads become dry, and the skin is as soft and free from blotches as on any other part of the body. It can be plainly detected in the urine, which is evidence of its penetration.

I know what Caustic Balsam will do, from actual experience in our family and am only too glad to let you use this letter or any portion of it as you see fit and in any manner you deem advisable, and furthermore will answer any letters from any sufferer as to more definite directions that I have found will produce the best results in the shortest length of time.

My son also had a bad bed-sore before the nurse said anything to me about it, but we covered it at once with gauze, four ply, held in place with tape, and kept soaked with Caustic Balsam and when removed last Saturday it was entirely healed. Bear in mind he has laid flat on his back since December 11th.

Sincerely yours, THOS. J. RICE.

The Pig is Half the Hog

INCREASED hog profits depend upon getting bigger litters of husky, fast-growing shoats. And that, Mr. Farmer, begins with getting your brood sows in the best condition to farrow.

OLYMPIC Hog Feed with *Dried Buttermilk* rapidly builds up hogs, and does it in a natural and healthy manner.

Give your pigs the right start through their mother. Feed your sows OLYMPIC Hog Feed with *Dried Buttermilk* from breeding time until the sows farrow and the pigs are weaned.

Sow's milk tests half again richer than cow's milk. Secreting such concentrated food is a drain on the sow's vitality, which can be replaced by feeding OLYMPIC Hog Feed with *Dried Buttermilk*.

Rich in milk-making and energy-building nutrition, OLYMPIC Hog Feed contains *Dried Buttermilk*, Flour Middlings, Corn Feed Meal, Linseed Oil Meal, Soybean Meal, Ground Barley and Digester Tankage.

Dried Buttermilk, an important ingredient, provides many of the properties of whole milk—plus lactic acid. This valuable acid sweetens the entire digestive tract, removes irritants and compels the assimilation of other feed.

By increasing and enriching the sow's milk, OLYMPIC Hog Feed with *Dried Buttermilk* makes healthier and faster growing pigs. It's the key to profitable pork production.

Holsteins Average $845 in Spring Classic

No more convincing proof of the stability of the Holstein breeding business in California could be expected than was furnished by the annual guaranty sale held at Sacramento, Thursday, March 17, when 44 head sold for a total of $37,175, an average of $845. Aside from distributing a highly desirable lot of cattle the sale served to demonstrate anew several facts that should be constantly kept in mind in considering the present status and probable future of our livestock development. First of all, there exist no grounds for assuming that in this state values for pure bred Holsteins have been inflated. Second, that it is possible to assemble from California herds a class of cattle equal to the best in other states. Third, that there exists in California a legitimate demand for cattle of quality and that the better sorts are always in demand at satisfactory prices. Again, the sale furnished evidence that quality will be sought out from small breeders as certainly as it will from herds of wide reputation. In the sale just held were consignments from several of the most prominent herds in America, and selling along with these and in some cases overtopping them were consignments from men making their first contributions to a public sale.

The committee of selection had done its work well and the offering presented was one of the most uniform ever sent through a sale ring in this state. Thirteen herds, 12 from this state and one from Washington, were represented in the sale. Twenty-one buyers, most of them new breeders, made up the sale list.

Two cows tied for the honor of topping the sale at $2,000. Mona Fobes, the great 30 pound cow from the Holmes consignment, was purchased by the J. S. Gibson Company, Williams, and Korndyke Model Hartog 3d from the Toyon herd and purchased by Fred Hartsook of Lankershim, were the two tops. Lady Creamcup, a two year old heifer from the Morris herd, was selected by W. J. Higdon of Tulare for $1,900 and looked well worth the money. Karlray Ormsby Alcartra, the heifer that holds the junior two year old world record for combined milk and butter production, was sold by the Bridgford Company to R. Stevens of Stockton for $1,850. Korndyke Model Hartog 2d and Ava Hartog Pietertje, both from the Toyon herd, were taken by the Sunshine Company, Los Angeles, for $1,325 each. The last named firm was one of the heaviest buyers of the better sorts. One of the sensations of the sale was the great 24 pound two year old, Pearl Na Dean De Kol, sold by Dean Beeman of Woodland to the Sunshine Company for $1,125. This was Beeman's first consignment to a public sale. The consignment from the Carnation Stock Farm furnished many of the real bargains of the sale. Eldorado Melba, a two year old from the Whaley herd, went to Chas. Anderson for $1,050.

The market for bulls was not as strong as had been expected. The top bull came from the Toyon herd and was Sir Toyon Fleta Johanna Mercedes, a June 1920 son of Sir Pietje Ormsby Mercedes 43d, and Cascade Fleta Johanna, with a milk production of 30,000.12 pounds. He was purchased by Frank Hatch and A. P. Miely of Modesto for $1,550. Sir Aaggie Mead De Kol 2d, a May 1920 son of Sir Aaggie De Kol Mead and out of Miss Dutch 2d, went to J. L. Sebastian of Wasco for $1,150, a real bargain. King Pontiac Tola Ormsby, a son of It and K. P. Tola, was sold to settle a partnership and was bought by Agee Brothers, who owned a third interest.

The Los Angeles County farm, represented by Manager Harriman, made a number of very excellent selections. As usual Fred Hartsook of Lankershim was a contender on nearly all of the better things. M. Azavedo of Patterson was also a good buyer.

The sale, which was managed by C. L. Hughes of the California Breeders' Sales and Pedigree Company, was another tribute to Mr. Hughes' ability. Col. Ben A. Rhoades of Los Angeles occupied his customary place on the box and was assisted by Cols. Bell and Davis.

A detailed list of the sales follow:

Consigned by Bridgford Holstein Co., Patterson

1, Karlray Ormsby Alcartra, 916 lbs. jr. 2 year old, Oct., 1917; R. Stevens, Stockton, $1,850.
2, Canary Alcartra Abbekerk, 23.16 lbs., Nov., 1917; Sunshine Co., Los Angeles, $1,075.
3, Miss Raphella Pontiac Prilly, March, 1919; C. L. Morse, Modesto, $1,175.

Consigned by Robt. Clapp, Nuevo

5, K. S. P. Lady Lillian Beets, Oct., 1919; H. Michel, Santa Monica, $550.

Consigned by A. W. Morris & Sons, Woodland

6, Lady Creamcup, Nov., 1918; W. J. Higdon, Tulare, $1,900.
7, Lady Alcartra Riverside Walker, May, 1918; M. Azavedo, Patterson, $550.
8, Sir Aaggie De Kol Mead 2d, bull, May, 1920; J. L. Sebastian, Wasco, $1,150.
Extra, heifer calf out of No. 7; Fred Hartsook, Lankershim, $375.

Consigned by Carnation Stock Farm, Seattle, Washington.

10, Carnation Gelsche Segis, May, 1917, 701.85 lbs.; Los Angeles County Farm, Hondo, $650.
11, Princess Plebe Jewel, Oct., 1914, 922.30 lbs.; Los Angeles County Farm, $725.
13, Abbekerk Segis Pauline, Mar., 1917, 20.87 lbs.; Sunshine Co., $825.
14, Lacconner Nertherland Pontiac Girl, Feb., 1918; Wm. F. Wattson, El Cerrito, $500.
15, Hollywood Lilith Palmyra Abbekerk, Dec., 1916, 22.89 lbs.; Los Angeles County Farm, $700.
Extra. Bull calf out of No. 10, Robt. T. Curtis, Woodlake, $175.

Consigned by Toyon Farms Association, Los Altos

16, Korndyke Model Hartog 3d, Jan., 1917, 23.76 lbs.; Fred Hartsook, $2,000.
17, Korndyke Model Harteg 2d, Feb., 1916, 27.45 lbs.; Sunshine Co., $1,325.
18, Ava Hartog Pietertje, Jan., 1917, 17.72 lbs.; Sunshine Co., $1,325.
19, Hengerveld Spring Pontiac Ava., May, 1918; Sunshine Co., $1,100.
21, Pauline Ophelia, Nov., 1912, 1,036.3 lbs.; Fred Hartsook, $800.
22, Edenwold Elizabeth Colantha, Aug., 1912, 1,069 lbs. Fred Hartsook, $700.
23, Sir Toyon Fleta Johanna Mercedes, June, 1920; Frank Hatch and A. P. Meily, Modesto, $1,550.

Consigned by R. L. Holmes, Modesto

24, Mona Fobes, Nov., 1913, 30.12 lbs.; J. S. Gibson Co., Willows, $2,000.

Consigned by Alex Whaley, Tulare

25, Eldorado Melba, Jan., 1919; C. W. Anderson, Burbank, $1,050.
26, Eldorado Mary Alcartra, Dec., 1918; Robt. T. Curtis, $300.
27, Lady Zenobia Homestead Canary, Mar., 1914, 24.16 lbs.; M. Azavedo, $550.

Consigned by Burr Farm, Los Angeles

28, Laconner Pontiac Evangeline, April, 1917, 16.61 lbs.; Los Angeles County Farm, $475.
29, Baroness Pontiac De Kol Belle, July, 1916, 19.86; Sunshine Co., $925.
Extra, bull calf out of No. 29; Robt. T. Curtis, $150.
30, Kappa Korndyke, Dec., 1918; Los Angeles County Farm, $475.
31, Yama Princess Alcartra, Jan., 1914, 27 lbs.; M. Azavedo, $800.

Consigned by Dean Beeman, Woodland

32, Pearl Na Dean De Kol, Jan., 1919; 24.02 lbs. Sunshine Co., $1,125.
33, Dean Tule Segis, bull, Dec., 1919; Marty Bros., Sacramento, $350.

Consigned by Agee Bros., Rivera

35, Paragon Whittier Pontiac, Dec., 1918; Los Angeles County Farm, $475.
36, Mercedes Nachefe Segis, Dec., 1912, 25.22 lbs.; M. Azavedo, $500.
37, West View Aggie Colantha, Dec., 1913, 28.56 lbs., Fred Hartsook, $525.
38, King Pontiac Tola Ormsby, bull, May, 1919; Agee Bros, $950.

Consigned by Fred W. Kiesel, Sacramento

39, Rest Easy Pontiac Veeman, May, 1915, 29.21 lbs.; Fred Hartsook, $700.
40, Sterling Colantha Duchess, May, 1917, 27.94 lbs.; Sunshine Co., $575.
